On Nov. 14, 1947, an agreement was signed with the two organizations representing conductors and trainmen, granting an increase of 15½ cents per hour in wage rates, retroactive to Nov. 1, 1947, and also granting changes in four minor working rules effective Jan. 1, 1948. Negotiations continued with the brotherhoods representing engineers, firemen, and switchmen, but no agreement was reached by the year's end.

If the same agreement is reached with the three remaining operating brotherhoods as that with conductors and trainmen, the additional payroll and tax cost for the operating group as a whole will be $165,600,000 annually. Combining this with the increase to non-operating employees, the total of the 1947 wage increases, on an annual basis, amounts to $633,000,000. Since 1939, the general wage increases have added about $2,200,000,000 to annual railroad operating costs.

PRICES OF FUEL, MATERIAL, AND SUPPLIES

The increase in wage rates since 1939 exceeded 70 per cent. Even greater relative increases have taken place in unit prices of railroad fuel and other materials and supplies.

In 1939, coal cost the railroads

about $2 per ton; today it costs more than $4 per ton. Fuel oil has likewise more than doubled in the price per barrel, while substantial increases have also taken place in the prices of diesel fuel, gasoline, and electric current.

The index of weighted average unit prices paid by the railroads for fuel, materials, and supplies stood at 131.9 in December 1939, at 208.5 in December 1946, and at 248.1 in December 1947, based on May 1933 as 100. The increase, December 1947 over December 1939, was 88 per cent, and for the single year 1947, 19 per cent.

The rise in prices since 1939 has increased annual railroad operating costs by more than $1,000,000,000. Of that amount, approximately $300,000,000 was in 1947.

PAYROLL TAXES

The Crosser Act became effective Jan. 1, 1947, and raised the rate of payroll taxes paid by the railroads by 2¼ per cent, or from 6½ per cent to 8¾ per cent. The rate in 1939 was 5¾ per cent. Thus, the increase in the rate, 1947 over 1939, added some $120,000,000 to annual railroad operating costs. Table II summarizes the increases in wage rates, prices, and payroll tax rates, 1939 to 1947.

TABLE II

INCREASES IN WAGE RATES, PRICES, AND PAYROLL TAXES

Year	Average Straight Time Rate of Pay (Cents per Hour)	Index of Fuel, Material and Supply Prices* (May 1933 = 100)	Payroll Tax Rate (Per Cent)
1939	74.0	131.9	5.75
1940	74.2	134.1	6.00
1941	76.9	147.0	6.00
1942	83.5	153.8	6.00
1943	89.3	166.2	6.25
1944	93.0	169.6	6.25
1945	93.3	178.2	6.25
1946	111.7	208.5	6.50
1947 (Dec.)	126.0	248.1	8.75

* As of December each year.

Combining the three unit cost factors shown in Table II, the over-all increase in weighted unit costs, December 1947 over 1939, was 76 per cent. The increase, December 1947 over December 1946, was 19 per cent.

FREIGHT RATES

By the beginning of 1947, unit railroad operating costs were approximately 47 per cent above pre-war levels. Against this increase, freight rates were up 17.6 per cent, passenger fares about 9 per cent, express rates about 19 per cent, and there had been no change in mail pay rates. During 1947, unit costs increased further to a level 76 per cent above pre-war. It became necessary, therefore, for the railroads to seek additional increases in rates and fares, which, if granted in full, will raise the weighted average about 48 per cent above pre-war levels.

On July 3, 1947, the railroads filed a petition with the Interstate Commerce Commission seeking authority to increase freight rates on the average by about 17 per cent. On Sept. 5, following the wage increase awarded non-operating employees by the Board of Arbitration, an amended petition was filed raising the freight rate increase sought to an average of 26.6 per cent for the country as a whole. In addition, immediate relief was requested in the form of a 10 per cent interim increase pending final disposition of the main proposal. On Dec. 3, the main petition was further amended raising the proposed increases to 29.2 per cent on the average.

The Commission held hearings in Washington beginning Sept. 9, in Chicago and other cities throughout the country during November, and final hearings in Washington beginning Dec. 8. Oral arguments were concluded on Dec. 20.

On Oct. 6, 1947, the Commission authorized the interim increases sought, a general 10 per cent increase with a maximum of 10 cents per ton on coal, coke, and iron ore. The overall average increase was 8.9 per cent. which became effective Oct. 13. Later, on Dec. 29, 1947, the Commission issued a second interim order, virtually doubling the previous interim increases authorized. These increases, which became effective Jan. 5, 1948, are to remain in effect until June 30, 1948, or such earlier date as they may be superseded by a final order in the case.

The main proposal, as finally amended by the railroads on Dec. 3, seeks an increase of 41 per cent on traffic within and to and from the East and an increase of 31 per cent on traffic within and between the South and the West. On certain commodities, however, specified maxima increases bring the over-all average increase sought down to 29.2 per cent.

The Commission's decision in the Class Rate Case (Docket No. 28300) was upheld by the U. S. Supreme Court in a decision handed down in May 1947. The new class rates, raised 10 per cent in the East and decreased 10 per cent in the South and certain parts of the West, were put into effect Oct. 13, 1947.

PASSENGER FARES

Increases in passenger fares were sought by the railroads in 1947 and were rather promptly authorized by the Interstate Commerce Commission. Unlike the freight rate petition, which was joined by all railroads, a number of passenger fare petitions covering individual roads or groups of roads were filed, and on different dates during the year. Generally speaking, fares in parlor and sleeping cars were increased from 3.3 to 3.5 cents per mile throughout the United States. Coach fares in the East and the South were increased from 2.2 to 2.5 cents per mile. A further increase in coach fares on the New Haven railroad to 2.875 cents per mile was later authorized. Round-trip and special fares throughout the country were generally increased. The Pullman Company was also authorized to file increased tariffs on sleeping accommodations.

EXPRESS RATES

The Railway Express Agency sought two increases in express rates in 1947. The first of these, averaging about 17 per cent, was authorized by the Commission and became effective Oct. 25, 1947. A second increase of 10 per cent was sought following the granting of wage increases to Express Agency employees. The Commission authorized the Agency to file tariffs on first and second class rates as proposed, subject to protest and possible suspension. If not suspended, the new rates will become effective in January 1948.

MAIL PAY

Prior to 1947, mail pay rates had not been increased since 1928, that increase being retroactive to 1925. On Feb. 19, 1947, the railroads filed a petition with the Commission seeking 45 per cent increase in mail pay rates. Railroad evidence in support of the increase sought was submitted in July at hearings before the Commission. At further hearings which began Sept. 30, counsel for the Post Office Department cross-examined the railroad witnesses on testimony submitted at the earlier hearing, but asked for a further extension of time before presenting the Department's case in opposition. This delay led the railroads to seek interim relief, which the Commission granted to the extent of an increase of 25 per cent in mail pay, retroactive to Feb. 19, 1947. No date has been set for further hearings on the full amount of increase sought.

FINANCIAL RESULTS

Railroad net earnings in 1947 showed slight improvement over 1946, but fell considerably short of what may be considered as a fair return on property investment. This is particularly significant when considered in light of the fact that railroad traffic was at a very high level throughout the year.

Total railroad operating revenues in 1947 increased about $1,000,000,000 over 1946, or by 13 per cent, due in part to the greater volume of freight transported and in part to the higher level of rates and fares. Operating expenses and taxes increased by $820,000,000, or 12 per cent.

Net railway operating income, or what is left after paying expenses, taxes, and equipment and joint facility rentals, approximated $763,000,000 for 1947, equivalent to a rate of return on net investment of 3.39 per cent. While this was an increase of $143.000.000 over net railway operating income earned in 1946, it was little more than half that earned in 1942 when a reasonably comparable volume of traffic was handled.

After interest and other fixed charges, net income for 1947 was $465,000,000, an increase of $178.000,000 over 1946, but a decline of $437,000.000 under 1942.

Table III gives the significant income account items for the years 1947, 1946, 1942 and 1929.

TABLE III

RAILROAD REVENUES

	1947* (millions)	1946 (millions)	1942 (millions)	1929 (millions)
Operating revenues	$8,612	$7,628	$7,466	$6,280
Freight	6,992	5,787	5,944	4,826
Passenger	945	1,259	1,028	874
Operating expenses	6,755	6,357	4,601	4,506
Operating ratio—per cent	78.4	83.4	61.6	71.8
Taxes	922	498	1,199	397
Payroll	353	254	171	—
Federal income	285	cr. 16	755	89
Net railway operating income	763	620	1,485	1,252
Rate of return—per cent	3.39	2.75	6.30	5.24
Net income	465	287	902	897

* Partially estimated.

RAILROAD LEGISLATION

While the first session of the 80th Congress enacted little legislation of direct significance to the railroad industry, a number of important bills were considered and will carry over into the second session. Among these may be mentioned: 1. Bulwinkle bill (H.R. 221 and S. 110), designed to stay the operation of anti-trust laws with respect to rate-making procedure and other joint actions approved by the Interstate Commerce Commission; 2. Hawkes-Howell bill (H.R. 3150 and S. 670), to amend the Railroad Unemployment Insurance Act by eliminating the sickness and maternity benefits added by the Crosser Act, and to put unemployment compensation taxes on a sliding-scale basis; 3. Jennings bill (H.R. 1639), to remove from the Employers' Liability Act the special venue provisions permitting actions brought thereunder to be instituted any place where the defendant is doing business; 4. Mahaffie bill (H.R. 2298), to reestablish in modified form the voluntary financial readjustment procedures of the McLaughlin Act which expired Nov. 1, 1945; 5. St. Lawrence Waterway and Power Project (S.J. Res. 111 and H.J. Res. 192), to approve the agreement entered into in 1941 between the United States and Canada for the improvement of the St. Lawrence River for navigation and establishment of hydroelectric power plants; and 6. Reed bill (H.R. 3980), to expedite railroad reorganizations.

COURT ACTION

The Supreme Court decision in May upholding the Commission's order in the class rate case (Docket 28300) has been discussed at an earlier point.

In March 1947, the Supreme Court affirmed the sale of the sleeping car properties of Pullman Incorporated to a group of 57 railroads. The lower court had ordered Pullman to separate its activities with respect to operation of sleeping cars and car construction.

Several interests sought to purchase the sleeping car business and, after hearings, the lower court authorized the sale to the railroad group. That decision was appealed to the Supreme Court.

There was little change during the year in the status of the two pending anti-trust suits against the railroads. In the Georgia case, briefs were filed and oral arguments were completed before the Master appointed by the Supreme Court, but he had not rendered a report by the end of 1947. In the Lincoln case, the Department of Justice filed a number of exhibits, to which the defendants filed objections. A reply to these objections by the Government was received by the court, and there the matter rested at the end of the year.

CONCLUSION

The year 1947 was one of great activity for the railroads. The demands upon them for service were the greatest in peacetime history. Those demands were largely met, but delay in the delivery of new equipment hampered the railroads to some extent in that respect. Somewhat brighter prospects for 1948 in equipment deliveries dispel any doubts that may have existed with regard to the capacity and ability of the railroads to meet the transportation requirements of the post-war economy.

The time-consuming process of raising rate and fare levels to meet new operating costs was very nearly completed by the end of 1947. If reasonable stability in wage rates and prices is attained in 1948 and general business activity remains near present levels, the railroads should experience a fairly prosperous year. However, there are too many uncertainties in the period ahead to permit a sound prediction at this time, but whatever may eventuate, the railroads stand ready, as in the past, to carry their part of the load.

HIGHWAYS

By Thomas H. MacDonald

Commissioner of Public Roads, Federal Works Agency

NATIONAL INTERSTATE HIGHWAY SYSTEM

Designation of a new nationwide system of highways, consisting of the principal routes in the Federal-aid system, was the most important development in the highway field in 1947. The 40,000-mile system, as mapped by the state highway departments, in cooperation with the Public Roads Administration, contains 37,681 miles of the nation's most heavily traveled highways, including 2,882 miles of urban thoroughfares. The remaining 2,319 miles were reserved for urban circumferential and distributing routes which were to be designated later.

The National Interstate Highway System as approved by the Federal Works Administrator consists of north-south, east-west, and diagonal routes that will make it possible to travel by a direct route to all large metropolitan centers throughout the country. The system reaches 42 state capitals and will serve directly 182 of the 199 cities in the country having a population of 50,000 or more. Rural sections of the system comprise only 1.1 per cent of all rural roads but carry 20 per cent of all rural traffic.

In recommending routes for inclusion in the system, state highway departments were governed by provisions of the Federal-aid Highway Act of 1944, which required that "there shall be designated in the continental United States a national system of interstate highways not exceeding 40,000 miles in extent, so located as to connect by routes as direct as practicable the principal metropolitan areas, cities, and industrial centers, to serve the national defense and to connect at suitable border points with routes of continental importance in the Dominion of Canada and the Republic of Mexico."

The Federal-aid Highway Act of 1944 authorized an appropriation of $500,000,000 in each of the first three post-war fiscal years to assist the states in developing a $3,000,000,000 highway program which would include improvements on the existing Federal-aid system, on extensions of the Federal-aid system through urban areas having a population of 5,000 or more, and on a Federal-aid system of secondary or farm-to-market roads in each state.

The sum of $225,000,000 was set aside from the authorized annual appropriation for improvements on highways in the regular Federal-aid system; $125,000,000 was made available for urban sections of the system, including expressways, circumferential and distributing routes; and $150,000,000 was earmarked for state systems of secondary roads.

No specific sum was provided for development of the National Interstate System; however, since the new system is a part of the Federal-aid system, funds made available for rural portions and urban extensions of the Federal-aid system may be expended on routes in the National Interstate System. In most states half of the cost of Federal-aid projects and up to one third of the cost of right-of-way may be financed by the Federal Government. The exceptions are states containing large areas of land in the public domain. In these states a higher rate of Federal participation is permitted.

Although the National Interstate System follows, in general, the main routes in the Federal-aid system, it may be necessary in many instances to relocate existing highways or build alternate routes for express traffic in order to meet essential standards of width, grade, alinement, and control of access.

Design standards recommended for the Interstate System, and endorsed by the American Association of State Highway Officials, call for four-lane divided highways wherever the traffic volume is 800 vehicles in peak hours. For such highways in rural areas, a right-of-way 250 feet wide is desirable. Traffic lanes 12 feet in width are recommended for all heavily traveled routes. Where traffic density exceeds 3,000 vehicles in peak hours, elimination of all cross traffic at grade is advocated. Since large streams of traffic obviously can not move swiftly and safely if obstructed continually by vehicles entering and leaving an express route, control of access to interstate routes in and near large cities is considered essential.

URBAN EXPRESSWAYS

By authorizing a specific appropriation for highways in urban areas having a population of 5,000 or more, Congress recognized the fact that development of a well-integrated system of main highways should include extensive improvements on arterial routes leading into and through large cities where traffic congestion is most serious.

Under the stimulus of Federal assistance, many cities, in cooperation with state highway departments and the Public Roads Administration, made commendable progress during the year in the planning and programing of expressways and other highway improvements designed to speed up the flow of traffic.

In a number of large cities depressed or elevated expressways will be built, making it possible for motorists to reach downtown business districts at an average speed of 35 to 45 miles an hour, without stops for traffic signals and without interference from cross traffic. Depressed sections of expressways will be supplemented by parallel frontage roads for "local" traffic, and bridges will be constructed at intersections to serve cross traffic. Many of the urban expressways will be integral parts of the National Interstate System. At the end of the year, work was under way on expressway projects in or near East Hartford, Conn., New York, Elizabeth, N. J., Pittsburgh, Washington, D. C., Cleveland, Cincinnati, Fort Worth, Dallas, Houston, Los Angeles, San Francisco, Oakland, Calif., and other cities.

PROGRESS OF THE HIGHWAY PROGRAM

Improvement of highways in the primary Federal-aid system progressed at a more rapid rate than in the previous fiscal year, but shortages of materials, particularly structural steel, and high prices continued as impeding factors, and the rate of progress was by no means commensurate with the need for better highway facilities. Only 2,991 miles of roads in the system were completed in the 1947 fiscal year, as compared with 8,709 miles in 1941. Also 4,609 miles of Federal-aid secondary road and 329 miles of miscellaneous construction were completed. Total cost of all completed work, including elimination of hazards at grade crossings, was $212,800,447, of which $122,383,712 was paid from Federal funds.

As the 1947 construction season advanced the highway program was greatly accelerated. The volume of work let to contract during the calendar year, while not as large as in 1941, indicated that road-building activities were approaching pre-war levels. Between Jan. 1 and Nov. 30, contracts were awarded by state highway departments for improvements on 42,422 miles of road, at a total construction cost of $832,033,000. Of this sum, $594,076,000 was for work on highways in the Federal-aid system and road construction financed entirely with Federal funds. The remainder was for work financed by the states and counties without Federal assistance.

The volume of work authorized or under way at the end of the year gave promise that substantial progress will be made in the highway program during 1948.

Of the post-war Federal funds available for the Federal-aid system and assigned to programed projects or those in a more advanced stage in November, 30 per cent had been applied to the National Interstate System. Funds so assigned amounted to $191,226,000 for 2,254 miles of improvement, at a total cost of $376,705,000. It is expected that a larger proportion of Federal-aid funds will be expended upon the Interstate System as conditions in the construction field improve and large projects now in preparation are offered to contractors.

SECONDARY ROADS

The states and counties made excellent progress during 1947 in the development of secondary-road programs and in the selection of additional routes to be included in the Federal-aid secondary system authorized by the Federal-aid Highway Act of 1944, which provided $150,000,000 for this class of road work in each of the first three post-war fiscal years.

The purpose of the legislation was to initiate a more comprehensive rural road program through the selection and improvement of a system of principal secondary or farm-to-market roads in each state to supplement the Federal-aid primary system in rural areas. Together, the two systems will form a closely integrated network of truck routes and "feeder" roads.

Selection of the Federal-aid secondary system by the states, in cooperation with county officials, was begun in the spring of 1945 and continued throughout the calendar year 1946. By the end of the fiscal year 1947, a total of 350,809 miles comprising the most important secondary roads in each state, had been designated for the system, as compared with a total of 217,073 miles at the end of the preceding year.

Additional routes will be added to the system in many states in order to incorporate sufficient mileage to allow adequate latitude in planning current programs and at the same time avoid the omission of any important secondary or "feeder" road. It is believed that these objectives can be reached with a total mileage for the United States of approximately 430,000 miles.

No limit was placed upon the mileage of the secondary road system, but the states were urged to include only such mileage as could be adequately improved within a reasonable period of years and maintained with revenues that may be expected to accrue.

Construction activities on Federal-aid secondary roads during the fiscal year resulted in the completion of improvements on 4,609 miles of roadway, at a total cost of $55,334,860. The Federal Government contributed $28,768,606. The projects included five structures to eliminate railroad grade-crossings, and a number of bridges. At the end of the fiscal year projects were under way or approved for construction on 12,977 miles of road, at a total cost of $270,420,784, of which the Federal Government was to pay $133,535,561.

Greater progress was made on secondary roads during the year than on other classes of highway projects. This may be attributed in part to the fact that both the Public Roads Administration and most of the states placed special emphasis on organizing and launching the secondary road program. Furthermore, the preparation of plans and solution of right-of-way problems are somewhat simpler than for many of the projects on main highways, making it possible to get projects under construction without delay. Too, contractors have shown greater interest in secondary road jobs since smaller quantities of "hard-to-get" materials are required, and generally there is less risk of financial loss than on big jobs.

HIGHWAYS IN NATIONAL FORESTS AND PARKS

Highway construction in national forests and parks, suspended during the war years, was resumed to a limited extent after the war, but improvements completed in 1947 were far below actual needs. Road work in national forests during the fiscal year was restricted almost entirely to roads used in the production of timber, and only minor work was done in the national parks.

Only 107 miles of forest highway were completed, consisting of 23 miles of initial improvement and 84 miles of further improvement of roads constructed in earlier years. At the end of the year, 404 miles were under construction. In the national parks a five-mile project was completed during the year, and 100 miles were under construction at the end of the year.

For these classes of roads there exists a wide gap between important needs and current rate of progress. The Federal-aid and state highway systems cross the great areas reserved as national forests on portions of the forest highway system. These sections of road are essential links in the highway transportation facilities of the country, particularly in the western states. They make available the mineral and timber resources of the national forests, and are used by a large portion of the interstate traffic in mountainous areas of the west. Improvements on national forest and park highways are financed entirely with Federal funds.

The Federal-aid Highway Act of 1944 authorized $25,000,000 for national forest highways, $4,250,000 for highways in national parks, and $10,000,000 for parkways, in each of the first three post-war fiscal years.

To avoid excessive use of materials required for the housing program, the President limited expenditures on forest highways during the year to $12,500,000. Actual appropriations were $13,714,222 for forest highways, $6,000,000 for national park roads, and $11,000,000 for parkways. These amounts, with unexpended balances from previous years, financed the work of the year.

Forest highways were important in the production of timber during the war, and there is definite indication that they will be essential in producing needed lumber for an indefinite period in the future. Of the forest highways contracted for during the year or recently completed, at a total cost of $15,564,000, 95 per cent are useful in the production of timber.

Forest highway improvements, on which work will be started as soon as funds are made available, include 1,459 miles of roadway at a cost of approximately $43,000,000. It is estimated that these roads will penetrate areas capable of yielding an annual timber harvest of 2,436,000,000 board feet, of which 1,913,000,000 board feet would be hauled by highway.

The Public Roads Administration and the National Park Service have undertaken jointly to select a system of roads for each national park and national monument, and to prepare a development program indicating the order of priority in which work will be undertaken as funds become available. Progress was made in this work during the year, but little actual construction was done. Because of limited funds appropriated, only 73 miles of park roads and parkways were awarded to contract, at a cost of $1,807,000.

MOTOR VEHICLE REGISTRATION

With traffic congestion already a serious problem in all metropolitan areas, the large increase in motor vehicle registrations during 1947 emphasized the urgent need for improved highway facilities to accommodate the rapidly swelling flood of traffic flowing over the nation's highways.

The estimated total of motor vehicle registrations in 1947 was expected to reach an all-time high of 37,164,000 by the end of the year, surpassing 1946 registrations by more than 3,218,000 and exceeding registrations in 1941, the previous peak year, by approximately 2,690,000.

The number of passenger cars registered during the year was approximately 30,545,000, as compared with 28,100,188 automobile registrations in 1946 and 29,524,101 in 1941.

The total number of truck registrations during the year was estimated at 6,492,000, an increase of 13.4 per cent over the 1946 total of 5,725,692 registrations, and 33.6 per cent more than 4,859,244 trucks registered in 1941. California, New York, and Pennsylvania led the states in motor vehicle registrations. Movement of vehicles on rural highways was 10 per cent above the pre-war peak.

THE INTER-AMERICAN HIGHWAY

Extending from Laredo, Texas, through Mexico and Central America to Panama City the Inter-American portion of the Pan-American Highway eventually will enable motorists to drive from the United States to South America. At present, however, several sections of the projected route are impassable and other sections can be traveled only in dry seasons.

Extensive improvements have been made on long stretches of the route, particularly in Mexico and Panama, but there are unimproved gaps in southern Mexico, northern Guatemala, Costa Rica, and northern Panama over which motor vehicles can not be driven. Approximately 50 per cent of the 3,300-mile route has been paved, 28 per cent has a surface comparable to low-type secondary roads in this country, and 12 per cent is passable in dry weather, leaving only 9 per cent impassable. Tourists will not be able to travel over the entire length of the highway until provision has been made for closing unimproved gaps.

Construction activities continued during the year on a few sections of the highway, particularly in Mexico and Guatemala, but progress of the work was seriously retarded by lack of funds.

Improvements on portions of the Inter-American Highway traversing Mexico are directed and financed by the Mexican Government. In the six Central American republics the United States Government, through the Public Roads Administration, is cooperating with the various governments in financing and constructing sections of the highway. Under provisions of the Inter-American Highway Act of 1941, the United States is paying two-thirds of the construction cost and is furnishing engineering advice and assistance. Most of the $20,000,000 appropriated for that purpose, however, has been expended or committed to projects already programed.

Practically all construction work on the Inter-American Highway is performed by local labor. A small number of men from the United States are employed in engineering, administrative, and accounting jobs. One of the objectives of participation by the United States is to assist in the development of skilled highway organizations in the Central American countries. Under the present plan, engineers, supervisors, and workmen are obtaining valuable experience in highway construction.

Local improvements have been made on portions of the Pan-American Highway in South America, notably in Bolivia and Ecuador, but the highway as a whole is not yet suitable for tourist travel.

The route extends south from the Panama-Colombia border, traversing Colombia, Ecuador, and Peru, and continuing along the coast to Valparaiso in Chile, then across the Andes to Buenos Aires, a distance of approximately 5,750 miles. A proposed alternate route runs east from Vitor in southern Peru, across the Andes to La Paz, capital of Bolivia, then south to Buenos Aires. From Buenos Aires, the route continues to Montevideo, then swings north to Rio de Janeiro.

THE MOTOR BUS INDUSTRY

By Carl W. Stocks

Editor, *Bus Transportation*

RECORD PRODUCTION OF BUSES AND TRUCKS

New records of production of buses were set in 1947, with 19,000 vehicles, exclusive of 17,000 school buses and 850 trolley buses. It was also indicated that truck production records had been set, with more than 1,500,000 vehicles. New production records were also set in tires at more than 101,000,000, of which 18,000,000 were for trucks and buses. These developments were all heartening as was the continued disposition of the carriers to carry forward their programs of modernization, postponed by the exigencies of the wartime period. In the bus industry the rate of increase of annual expenditures since 1940 has been more than 100 per cent. Even with this tremendous splurge in spending, the industry is still far behind in its program of bringing its plant and equipment up to present day requirements.

THE COST OF OPERATION FACTOR

On the economic side the carrier, like all other business, has been hard hit by increased costs of both labor and materials. These, the city companies, in particular, have sought to offset by seeking fare increases and readjustments. Of 412 cities with a population of more than 25,000, a total of 107 have had fare increases since V-J Day and 16 have had two increases. At the end of the year, at least 50 other cities had applications for increases pending. In respect to passengers carried, the companies have been fortunate since traffic has held up surprisingly well despite the predictions of persons in the industry that it was too much to hope that the inordinate riding of the wartime period would carry over for long in the period of the return to peace time economy. The experts had maintained that the riding total would drop severely immediately after V-J Day; instead, it increased, and 1946 broke the riding record, due largely to the high level of national employment and the continued lack of alternate means of transportation. So far as riding and revenues are concerned, the transit industry continues at nearly the same levels established during the peak years, but the rising cost of operation, due particularly to increased labor costs, is resulting in a substantially lower net for the industry as a whole. For the first time since before the war, however, the normal decline in transit riding during the summer months reappeared, and the industry is entering the period of increasingly active competition from the private automobile. That, in short, was the situation in the local transit industry at the end of the year.

INTERCITY TRAFFIC

In the intercity field, as in the city field, 1948 sets a new high in economic imponderables. Foremost is the continuing squeeze in declining revenues and increasing costs. At the close of the year indications were that the number of passengers carried in 1947 would be a little below the level for 1946, but the more adequate service given required some 5 per cent more bus miles. As in the local transit industry as distinguished from the intercity service, the decline in intercity traffic that was anticipated post-war has been delayed by the unprecedented high level of employment, and the prolonged shortage of private automobiles. Here again, barring unforeseen developments, competition from private automobiles is certain to increase. Factually, new equipment, terminals, and garages, together with better schedules, have added much to the attractiveness of the industry's service. Certainly, these improvements have been an important factor in preventing a more rapid decline in the volume of business than had been predicted by some statisticians and expected by many others in the industry.

GROWTH OF THE INDUSTRY

Speaking statistically, as it were, there are now 164,000 buses and trolley buses in operation and 81,500 common carrier vehicles operated over regularly scheduled routes in city, suburban, and intercity service, carrying 10,000,000,000 passengers annually.

In the six years between 1940 and 1946 the number of common carrier companies increased from 3,480 to 4,360, the number of common carrier buses and trolley buses owned increased from 56,800 to 81,500, the number of passengers carried from 4,719,500,000 to 10,551,000,000, the value of buses built from $98,000,000 to $200,000,000 and the revenue miles operated from 2,067,300,000 to 3,613,100,000.

EXPANSION IN BUS SUBSTITUTION FOR STREET CARS

In the matter of the substitution of buses for street cars the process of attrition, which was brought to a halt during the war, continued during 1947, with the notable supplanting of street cars by buses by the Third Avenue Transit System so that Manhattan has become an all-bus borough. Plans made in other cities for similar substitution are under way notably on the municipal transit system in New York and Chicago in which plans for improvements call for increased use of the bus. Seattle, San Antonio, Rochester, Memphis, Houston, Nashville and Hartford are among the largest cities that have gone either all-bus or all-bus and trolley bus.

THE OUTLOOK

The 1948 outlook for new buses and replacement parts, on the basis of indications at the end of 1947, was generally regarded by the manufacturers as appreciably better than that faced by the industry at the beginning of 1947, but the parts situation was complicated and gave promise of being tight by the scramble of the entire automobile industry for the raw materials to build more and more cars. Despite the imponderables of an economy that has become unusually distorted, the outlook for the carriers in 1948 in many aspects was reasonably reassuring.

COMMUNITY TRANSIT

By GUY C. HECKER

EXECUTIVE MANAGER, AMERICAN TRANSIT ASSOCIATION

SCOPE OF OPERATION

In 1947, the staggering number of almost 23,000,000,000—actually 22,661-000,000—passengers were carried on the buses, trolley cars or coaches, elevated and subway vehicles of the transit industry in the United States. This was a decline of 711,000,000, or 3.04 per cent, from the record-shattering figure of 23,372,000,000 for 1946.

Transit vehicles operated a total of 3,284,000,000 miles, a slight decrease of 0.61 per cent from the 1946 total. However, a small increase occurred in the number of miles of line operated.

REVENUES AND EXPENSES

Survey figures for 1947, based on 10 months actual operation, preliminary figures for November, and estimates for December, show that the industry's revenues were $1,394,900,-000, or $2,200,000 less than in 1946, a decline of 0.16 per cent.

Against this 1947 operating revenue was an operating expense of $1,251,-800,000, or $122,370,000 more than the previous year, a 10.83 per cent rise. Thus, net revenue for 1947 was $143,-100,000 as against $267,670,000 for '46, a startling decline of 46.54 per cent.

During 1947, total payroll costs were $797,000,000, an increase of 11.78 per cent over the $713,000,000 totaled in 1946. In the latter year, these costs were 51.03 per cent of total operating revenue, while in 1947 they were estimated to be 57.14 per cent of total operating revenue.

LABOR

Since V-J Day, the transit industry has closely followed the trend of other industries in granting pattern wage increases of approximately 18 cents to 11 cents, respectively, during 1946 and 1947. Such increases, when granted to workers in other industries, were predicated largely on reductions in take-home pay resulting from post-V-J Day changes in the work-week from six to five days. In the transit industry, however, many workers, particularly operators, have had no corresponding reduction in their work-week. As a result, transit take-home pay increased about 20 per cent from January, 1945 to September, 1947, whereas take-home pay of many employees in manufacturing industries only recently has returned to the January, 1945 level.

In addition to increases in hourly wage rates, many transit employees have received improvements in, or additions to, existing working conditions and benefits, since current union objectives include not only substantial increases in hourly wage rates and important changes in working conditions but much emphasis is placed on pensions, holiday pay, sick leave, and other benefits.

Non-basic wage items (pay for time not actually worked) exist to some extent in all industries but they are particularly numerous in the transit industry. When all collateral payments and benefits paid by a transit company are calculated and related to projective platform of hours, it is not unusual to find the cost ranges from 15 per cent to 30 per cent of the basic hourly wage rate. There are some instances where fringes amount to over 50 per cent of the basic rate.

FARES

As an expected result of the great increases in all costs, more and more companies have been forced to seek relief through increased fares. During 1947, fares in 74 of the 412 U. S. cities with populations of over 25,000 were increased, and six of these cities have already had a second rise during the year.

For the first time in modern transit

history the 10-cent ceiling in local fare rates for a city-wide transit system was broken Nov. 1, 1947 when Cincinnati increased its cash fare to 11 cents. This is particularly significant since this is one of the few cities with a "service-at-cost" franchise. Chicago preceded Cincinnati with a partial break-through of the 10-cent ceiling when the rapid transit lines in that city raised cash fares to 12 cents on May 5, 1946.

The following table shows the number of cities in each population group having fare increases in 1947:

	Total Number of Cities in Each Group (1940 Census)	Number of Cities in which Fares Were Increased in 1947
Over 1,000,000 Population.....	5	2
500,000–1,000,000.	9	3
250,000–500,000...	23	11
100,000–250,000...	55	16
50,000–100,000....	107	19
25,000–50,000.....	213	23
	412	74

Since V-J Day, and including fare increases reported in 1947, 116 cities in these population groups have reported increases, and, based on incomplete reports, there are now pending as of the end of 1947 applications for increases in nearly 50 more communities of over 25,000.

Only two large cities with populations over 250,000 (Dayton, O. and New York City) enter 1948 with a straight five-cent cash fare. In New York, there is a growing realization of the futility of deficit financing of the municipally owned transit system, and the authorities are now in the process of seeking an increase in fare to cover, at least, operating costs.

NEW EQUIPMENT

During 1947, approximately 12,500 new passenger vehicles, including modern streamlined streetcars, trolley coaches, and motor buses, were delivered to local transit companies throughout the nation. Practically all of these vehicles replaced worn-out, war-weary equipment. At the end of 1947, the industry had 92,800 passenger vehicles in operation.

Survey figures also reveal that in the last six years more than 60 per cent of the industry's motor buses have been replaced with new vehicles.

THE RISING COST PROBLEM

Spiraling labor costs and increased operating expenses, when considered together with the recent decline in transit riding, have presented very serious problems. Naturally, the transit industry has not been singled out as the sole victim of rising costs, but this industry is extraordinarily a victim of these circumstances for two reasons:

(1) The proportion of total costs represented by transit labor is extremely high, and increased wage costs cause a horizontal rise in a substantial part of the costs of operation. Not infrequently these costs are retroactive, and upon determination of the amount of a wage change, it is discovered that operations for a period already expired have been conducted

ANNUAL TRANSIT VEHICLE PRODUCTION

	1939–40 Average	1941	1942	1943	1944	1945	1946	1947*
Streetcar	417	462	284	32	284	332	421	700
Rapid Transit..........	83	0	0	0	0	0	0	0
Trolley Coach..........	449	411	336	117	55	161	266	800
Motor Bus.............	3,951	5,600	7,200	1,251	3,807	4,441	6,463	11,000
Total...........	4,900	6,473	7,820	1,400	4,146	4,934	7,150	12,500

* Preliminary estimate.

at a low margin of profit, or in extreme cases, at an actual loss.

(2) These rising costs affect the transit industry in a peculiar manner because of the complexity of the machinery provided for increasing fares to offset higher costs. The latter can not be followed immediately with increased prices. An intermediate step must be consummated with the Public Service Commission or other supervisory authority before a change in rates can become effective. Frequently, this has meant long delays. During the period of such delay, the transit company is forced to operate with inadequate fares, and high costs are necessarily being paid. Reserves are, therefore, being consumed and often equity capital has been deprived of its return.

There is growing evidence that labor is also aware of this constantly acute situation and is prepared to change its previous short-term view to a long-range position, which gives greater recognition to the fact that the industry can not remain in a healthy condition unless a reasonable return on investment is earned. It is hoped that mutual understanding and cooperation will make it possible for management and union labor to work out a satisfactory solution of their common problem.

According to the experts, the riding total should have dropped severely immediately after V-J Day; instead, it increased, and 1946 broke the riding record, owing largely to the high level of national employment and continued lack of alternate means of transportation. Now, transit is entering a period of increasingly active competition from the private automobile, and there may henceforth be a reappearance of the normal decline in transit riding during the summer months.

Topflight management in the industry is of the solid opinion that to assure best possible equipment and carry through other improvements, an adequate future fare must provide sufficient revenue to meet all costs of service, taxes, provision for depreciation, interest charges, and a proper recompense for the capital employed. To the extent that these requirements are met will depend the quality of future service.

THE MERCHANT MARINE

By John C. Niedermair
Bureau of Ships, Navy Department

GENERAL STATUS OF SHIPBUILDING IN U. S. YARDS

At the semi-annual meeting of the Board of Managers of the American Bureau of Shipping, on July 29th, 1947, it was reported that the production of large merchant vessels of over 2,000 gross tons each by shipyards of the United States during the first six months of 1947 totaled 21 of 146,994 gross tons and of 173,927 deadweight tons, employing 171,950 horsepower of propulsion machinery. All of these vessels were especially designed for specific trade purposes. Included in these totals were seven fully refrigerated cargo ships, five dry cargo ships, two self-unloading bulk carriers, six combination passenger and cargo vessels, and one combination passenger and vehicle carrier. No tankers were completed during the first half of the year but two were scheduled to be finished in the second half.

These new vessels were for operation under the American flag with the exception of two of the dry cargo ships and the two bulk carriers. Most of the new American flag vessels were built with the aid of a government construction-differential subsidy, and in some cases represent adaptations of Maritime Commission designs altered to suit the requirements of specific trade routes.

On order and still to be completed by American shipyards, as of July 1, were 39 large steel merchant vessels of 217,384 gross tons, plus more than 200 miscellaneous commercial craft of over 100,000 gross tons. Included in the latter were ferries, trawlers, towboats, tugs, oil and cargo barges. Of the 39 large vessels on order, 23 were for foreign account. Most of these vessels were completed during the year, leaving little carry-over for 1948.

STATUS OF PRIVATELY OWNED VESSELS

Privately owned American flag vessels, exclusive of the Great Lakes, as of July 1947, totaled only 800 of about 6,000,000 gross tons and 9,000,000 deadweight tons. The corresponding pre-war status of American flag vessels, Jan. 1, 1939, was 1,252 vessels of 7,111,383 gross tons and of 10,600,000 deadweight tons. The average gross tonnage of the pre-war owned ships was 5,600 tons while the current fleet averages 7,500 tons. The average speed has increased from 12 knots to about 14-15 knots. These 800 privately owned ships include 300 tankers of about 2,700,000 gross tons and 500 cargo vessels, with a few passenger ships, of about 3,300,000 gross tons. While a large percentage of the tankers are employed in the domestic trades, only a very small percentage of the cargo ships are likewise utilized. Much of this tonnage is relatively new, consisting mainly of Maritime Commission built vessels.

The privately owned American tanker fleet, as of July 1, 1947, averages about 10 years in age, 13.5 knots in speed, and 14,700 tons in deadweight tonnage. The total gross tonnage of 2,700,000 tons of these 300 vessels is about equal to the pre-war tanker fleet of 2,675,075 tons which included 377 vessels. Thus with 77 units less, an equal tonnage can be moved, and with a greater average speed and carrying capacity more voyages can be accomplished per year and more oil transported than with the pre-war tanker fleet which at that time averaged over 17 years in age. In addition, the Maritime Commission still owned, at that time, about 500 tankers of about 5,000,000 gross tons and 8,000,000 deadweight tons, most of which are war-built, except for a number of obsolete vessels acquired on a trade-in basis when selling new tankers to American operators.

Before the war United States shipping interests owned 723 cargo vessels of 3,331,746 gross tons operated under the American flag. Only 152 of these were utilized in foreign trade, while, as of July 1947, almost 450 were so engaged. In the domestic trades 398 vessels were running in the pre-war period as compared with 50 vessels in July 1947.

Privately owned combination passenger and cargo vessels under the American flag in 1939 totaled 152 of 1,104,562 gross tons, while, as of July 1947, only about 45 vessels of 350,000 gross tons were so engaged. The only vessel now in the trans-Atlantic trade fully complying with United States regulations as a passenger ship is the *America*. This ship may be supplemented later by the 17-year old *Washington*, participating in this trade as a fill-in. The only large liners under the American flag are the Matson trans-Pacific vessels, some of which are now being reconditioned; the three government-owned 20-year old East Coast South-American liners, being rebuilt; the two new P-2 liners soon to be completed for the American President lines, probably replacing the two P-2 transports now being operated; and the two comparatively new C-3 passenger vessels engaged in round the world service.

SHIPBUILDING AND REPAIR

In April 1947 the situation with regard to the shipbuilding of the United States was extremely dark. The report to the Shipbuilders Council of America by H. Gerrish Smith on April 17, 1947 stated that only prompt and effective action by the Federal Government would prevent complete cessation of merchant shipbuilding in the United States within the next 12 months. Not a single ocean-going passenger or cargo vessel would be under construction in a private American shipyard after the first quarter of 1948 and that by the end of 1947 naval shipbuilding will be reduced to seven vessels. It was further stated that at no time in the history of ship construction in this country had the outlook for the industry been as dark as it then appeared. All of the naval construction was in the nature of cleaning up war contracts, and on the larger part of the merchant ship work the design and other technical work was almost wholly completed in April 1947.

The work on which the yard technical staffs were then engaged was mostly on modifications under existing naval contracts based on war experience. The seriousness of the situation was further emphasized by the fact that the shipyard technical staffs, which had been developed and trained over a long period of years, could not continue to be maintained under such conditions. Design and engineering work on new contracts would have to be made available, if these key forces were to be prevented from disintegrating.

Employment in the shipbuilding industry had been largely sustained since the close of the war by repair and conversion work which does not provide opportunity for work by diversified technical personnel which is vital to design and new construction. It was this critical nature of the problems of the shipbuilding and ship repair industry and of the American Merchant Marine that President Truman assigned as the reason for his establishment, in March 1947, of an Advisory Committee on the Merchant Marine. This development was considered to be the principal ray of hope for the industry, and it was felt that the Advisory Committee would find solutions to the problems because it was considered that not only commerce and trade were at stake, with all they mean to the economic welfare of the nation, but the National security, as well, was involved.

The President's committee offered a means to determine authoritatively and convincingly not only the requirements of an adequate American Merchant Marine, but also the minimum building program of both merchant and naval vessels necessary to preserve the shipbuilding and ship repair industry in a condition of availability for quick expansion as an essential factor in national security.

The President's Advisory Committee is composed of the following members: K. T. Keller, president, Chrysler Corporation — Chairman; M. B. Folsam, treasurer, Eastman-Kodak Company — Vice-Chairman; A. W. Robertson, chairman of the board, Westinghouse Elec. Corp.; J. B. Black, president, Pacific Gas and Electric Co.; and Vice Admiral E. L. Cochrane, formerly Chief of the Bureau of Ships, United States Navy, and president of The Society of Naval Architects and Marine Engineers.

Employment in the private yards dropped 146,400 during 1946, reaching 156,100 by the end of December 1946. Approximately half of these employees were employed in ship repairing work and conversion. Hourly earnings in December 1946 were reported at an average of $1.423, the largest of any industry with substantial employment in either the general manufacturing or durable goods field.

SUMMARY OF SHIPBUILDING AND REPAIR

The demand for special purpose river and harbor craft has continued month by month throughout the year. Nearly all of the small yards equipped to turn out this type of steel construction were fully occupied for the past 18 months, May 1946 to November 1947, and conditions appear good for some time in the future. The large ship repair plants and shipbuilding yards have been practically full to capacity with all types of ship repair, alteration, and conversion work. At the present (November 1947) the current project of interest is the taking, from the laid-up status, of the 44 T2-SE-A2 type of turbo-electric-drive oil tankers for use by the Navy Department. This project will add considerably to the work of the repair yards in the way of changes which must be made before the tankers can be returned to service. These tankers are of greater speed and power than the standard T2-SE-A1 type, employing 10,000 shaft horsepower as compared with 7,240 shaft horsepower of the latter tankers. The vessels of over 2,000 gross tons each, completed in 1947 up to Oct. 1 are as follows:

Type	No.	Gross Tons	Deadweight Tons	Horsepower
Cargo	10	61,788	90,456	77,080
Cargo—Refrigerated	7	41,501	40,001	63,800
Cargo—Bulk Carrier	2	9,636	21,483	6,000
Passenger—Auto Ferry	1	4,106	700	4,800
Passenger—Cargo	6	54,199	56,518	53,350
Tanker	1	13,365	27,928	13,400
Totals	27	184,595	237,086	218,430

WAR-BUILT VESSELS SOLD BY THE U.S. MARITIME COMMISSION

The following tabulations (A) and (B) summarize the vessels sold to the various countries of the world, under the terms of the merchant ship sales act of 1946, from Aug. 1, 1946 to Aug. 1, 1947.

REPORT OF THE PRESIDENT'S ADVISORY COMMITTEE ON THE MERCHANT MARINE

The committee referred to in the previous discussions submitted its report to President Truman in November 1947 with recommendations regarding the national requirements for shipping and shipbuilding. The report is a very comprehensive document which discusses in some detail the past, present, and future conditions and requirements of the shipping and shipbuilding industry. The committee recommended a long range shipbuilding program which included the building of 46 passenger-carrying vessels during the period of 1948 to 1951. The spread of the building program is divided into eight vessels to be started in 1948, 10 vessels in 1949, 13 vessels in 1950, and 15 vessels to be started in 1951. It is estimated that the cost of this program will range between $500,000,000 and $600,000,000 or average about $150,000,000 a year.

The committee also discussed the basic national policy and the administration of that policy. The passage of the Merchant Marine Act of 1936 shifted the emphasis away from direct government participation in shipping and towards private ownership and operation. The statement of policy of the act makes this clear. Although under the provisions of the act the Government may build and own ships, such ships are to be operated on a charter basis by commercial companies. Government assistance has been stripped of its disguise as mail-contract payment and is now provided in the form of a direct and open subsidy which is applied both to the construction and to the operation of ships engaged in foreign trade on routes determined to be essential.

ALTERNATIVE BASIC POLICIES

There are three basic operating policies which the United States might

TABLE (A) BY COUNTRIES

follow with respect to its merchant marine: (a) Private ownership and private operation (with government assistance and regulation); (b) Government ownership and government operation; (c) Government ownership and private operation. Each of these policies has its advocates. As has been indicated in the foregoing paragraphs, all have been tried to some degree at various times in the past. At the present time parts of the active merchant marine are operating under each.

Preponderantly, the United States fleet is government-owned. The larger part of the tonnage is represented by cargo ships chartered to commercial companies under the terms of the Ship Sales Act, but there are also a number of tank ships and troopers, which, by an extension of emergency war powers, are being operated under agency agreement for government account. Both of these categories are being run primarily to meet the immediate and temporary demands for relief and rehabilitation movements. It is expected that these ships will be retired gradually from service as world conditions become more normal; but, in addition, a number of government-owned vessels are chartered to operators in the Alaskan trade on special terms in order to insure essential service to that territory, and four of the largest passenger-carrying vessels in the American Merchant Marine—the *America, Argentina, Brazil,* and *Uruguay*—are government-owned.

World conditions at some time in the future may make necessary the socialization of all or of a considerable part of the American Merchant Marine. Other nations, notably France, Italy, Brazil, and Argentina, have turned to this device. The Com-

mittee believes, however, that ultimately the best prospect for a strong progressive United States Merchant Marine lies in one that is to the greatest degree possible privately owned and privately operated; that government assistance should be only to the extent necessary to maintain it at a size which shall have been determined to be the minimum necessary for reasons of security, by placing it on a fair competitive basis in essential foreign trade routes, and by protecting it against discriminatory practices in its domestic services; and that government ownership and charter operation should be reserved only for such cases as may develop where the conditions of the service involved clearly preclude private ownership.

Such a policy must make allowance for the freedom of action, incentive, and initiative required by private enterprise if it is to be able to develop its commercial service and build up business in a highly competitive field, but must provide as well for the regulation necessary to assure that public funds expended are used to promote public interests. It must insure that the people of the United States obtain full value from these funds, in the form of a merchant marine which will guarantee their free access to the markets of the world in times of peace and which will provide the necessary measure of security in time of war. Government assistance must not be perverted to support or foster inefficiency or incompetence, neither must government regulation be so stringent as to hamper the legitimate effort of private enterprise to develop a remunerative business. The adjustment of these factors is indeed one of the most complex and vexing problems involved in the relationship between the Government and the maritime industries today, and is one which will continue to require sound judgment and constant vigilance.

The committee did not feel qualified to attempt to make an independent determination of the size of the merchant fleet or the size of the shipbuilding required for the nation's security. Based on its studies it endeavored to evaluate in the light of the security considerations the various estimates which have been made available to or presented before it concerning the minimum size at which these two national assets should be maintained in the post-war years. The estimates for the size of our active merchant fleet fall within the lower limit of 860 ships of 8,900,000 deadweight tons and the upper limit of 1,325 ships of 13,350,000 deadweight tons given in the report prepared by the Graduate School of Business Administration, Harvard University. The mean of all of these estimates lies slightly above 1,000 ships of between 11,000,000 and 12,000,000 deadweight tons. The Committee believed that under current conditions this mean represents a reasonable minimum size of an active seagoing merchant fleet to meet the country's security requirements, providing that it is kept at a high pitch of efficiency by being composed of fast modern ships; is properly balanced as to type between passenger-carrying vessels, dry-cargo vessels, and tankers; and is backed up by a reserve of inactive ships also balanced as to type and kept in a state of reasonable preservation and readiness.

This belief is given general confirmation by the testimony of the armed services in their appearances before the Committee.

Such a fleet would give employment to upward of 65,000 licensed and unlicensed personnel based upon employment in the industry before the war, and this level appears to assure a minimum nucleus for expansion in time of emergency. The fleet would be approximately as numerous as our pre-war fleet, but the increased size and speed of the vessels which are now either available or projected will give it a carrying capacity between 25 and 50 per cent greater than that of the merchant fleet this country possessed in 1939.

THE RESERVE FLEET

The size and composition of the reserve fleet is a matter which the Committee believes should be determined by the Joint Chiefs of Staff. It is important that this reserve fleet be kept fluid in the sense that, as modern ships are built to replace obsolescent ships in the active fleet, these obsolescent ships should be retired to the reserve fleet where in turn they would displace the least desirable ships which would then be scrapped. From information furnished to the Committee by the Maritime Commission, it appeared that when sales to private interests and foreign countries are completed under the Ship Sales Act of 1946 and when useless overage ships have been scrapped, there will remain from our wartime fleet, which totaled over 5,400 vessels aggregating 57,300,000 deadweight tons, somewhat more than 2,000 ships aggregating over 26,000,000 deadweight tons to which the Government will hold title. These ships are available for lay-up in the reserve fleet.

Since the reserve fleet is to be maintained solely for wartime and emergency use, the Committee believes that it could be placed most appropriately under the administration of the Secretary of Defense.

NATIONAL SECURITY FACTOR

The Committee concurred generally in the findings of the report, "Economic Survey of the American Merchant Marine," prepared in 1937 by the United States Maritime Commission under the direction of Joseph P. Kennedy, then Chairman. The conclusion of that report that the establishment of regular American flag liner service from our ports to the markets of the world is of outstanding benefit to the American importer and exporter because of the improvement in service which results and because of the insurance our own ships provide against interruption of service is as valid as it was in 1937. Similarly, the findings published in the various reports of the Board of Investigation and Research, established under the Transportation Act of 1940 to investigate the relative economy and fitness of the various domestic transportation instrumentalities, are believed to have demonstrated the importance of domestic trade water carriers to our national well-being.

The Committee, however, in its attempt to evaluate the national requirements for shipping and shipbuilding, has chosen to confine itself primarily to the considerations involved in national security, and from this approach the economic justification for a merchant fleet becomes not an end in itself but rather the means whereby a merchant marine of sufficient size to meet the security requirements of an expandable nucleus can best be assured and be maintained with the minimum expenditure of public funds.

Under the most favorable conditions and regardless of the amount of aid furnished by the Government, it will be impossible for the economy of this country to support in time of peace an active merchant marine and an active shipbuilding industry of the size which will be required in the event of a future major war.

It is obvious that the larger and the more efficient the active merchant fleet and the active shipbuilding industry maintained in time of peace are, the better prepared the nation will be in the event of war. The armed services indicate no concern that the merchant fleet may become too large. Both the Army and the Navy representatives in their appearance before the Committee emphasized that the requirements of any future major war for shipping and for shipbuilding will exceed, in volume and in the speed with which they will be needed, the requirements of the Second World War.

Conceivably the United States as the wealthiest and most powerful nation of the world might follow a policy of subsidizing shipping to an extent enabling it to dominate world trade. Such a policy, it is believed, could lead only to the most unfortunate results. Many maritime nations are far more dependent upon shipping than is the United States, and several derive a not inappreciable percentage of their national income from the sale of shipping services. Any attempt on the part of the United States to monopolize a large part of world shipping would result inevitably in retaliatory measures from those nations receiving real or fancied hurts. Trade barriers would be raised against our commerce and we would alienate the other maritime nations of the world. The hostility so engendered could constitute a threat to world peace that would more than offset the advantage of a tremendous merchant fleet.

Numbers of ships alone do not constitute a merchant marine any more than shipways alone constitute a shipbuilding industry. The fleet must be balanced as to types of ships, and these types should be of modern, efficient design. Fortunately, the needs of commercial services are diverse, and when met provide in a large measure for satisfying the varying demands of war. Even more important than the material facilities are the managerial and operating organizations, the technical and design staffs, and the trained and skilled labor employed. Ships and shipyards may be laid up in reserve for future use, but without the competent personnel to bring them into action, they are only of potential value. The problem is to maintain both industries at a size sufficient to meet essential peacetime requirements, to supply initial and immediate emergency demands, and to be capable of rapid expansion.

XIII. MANUFACTURES AND TRANSPORTATION

COMMERCIAL AVIATION

By Andrew F. Haiduck
Fairchild Engine and Airplane Corporation

GENERAL

The year 1947 was again a period of record-breaking peaks in passenger and cargo transportation by the airlines. The only category showing a slight drop was that of air mail which declined less than one per cent. According to figures announced by the Administrator of Civil Aeronautics, the total number of passengers carried by the domestic and international lines increased to 15,700,000, an 18.5 per cent increase over the 1946 total. The domestic lines accounted for approximately 91 per cent of the total passengers carried. With the total of airline planes increasing from 816 in 1946 to 961 at the end of 1947, the average passenger load factor dropped to between 60 and 70 per cent.

Domestic air freight volume increased sharply to 40,702,000 ton-miles, a 111 per cent gain over 1946. International carriers did even better with a 127 per cent increase with a total of 34,253,100 ton-miles for the year.

Domestic air mail declined approximately one per cent to 32,757,300 ton-miles, whereas the international air mail rose 95.9 per cent to a ton-mile total of 15,943,393.

Higher operating expenses resulted in two ten per cent increases in passenger fares, bringing the average cost per mile to approximately 5.5 cents. The principal reasons for higher expenses were reduced load factors, higher wage rates, depreciation charges and fixed charges on funded debts.

At the end of the year, there were 5,850 airports, a 30 per cent increase over the 1946 figure of 4,490. The Federal Aid Airport Program progressed to the construction phase when 127 airport projects had been given financial assistance amounting to $12,966,628.

The number of certificated pilots rose from 400,000 at the end of 1946 to approximately 455,000 at the end of 1947. Private pilot certificates increased nearly 100 per cent, with 125,000 issued. Student pilot permits issued under the stimulus of the GI Bill of Rights increased by 200,000 during the year. The number of registered civil aircraft increased to an estimated 95,000 from the 1946 total of 81,000.

Production of airplanes declined precipitously from a 1946 high of 35,000 to 15,800 in 1947, a reduction of 55 per cent. Failure of the commercial market to develop in the predicted volume resulted in a net loss of $25,000,000 to the aircraft manufacturers after tax carryback. It was apparent at the end of the year that production of personal aircraft would have to be tailored to fit a very much reduced market.

While the number of fatal accidents decreased during the year, the crashes involved the larger 50-place planes and naturally resulted in the deaths of more persons. The fatality rate was estimated as 3.21 per 100,000,000 passenger miles, much higher than the figure of 1.24 for 1946.

Research continued in the direction of guided missiles, jet engines, rocket motors, supersonic speeds, and the application of atomic propulsion for aircraft. The most outstanding event of the year was the penetration of the sonic barrier by the Bell XS-1. For the first time, man has flown at speeds in excess of that of sound.

SCHEDULED AIR TRANSPORTATION MILEAGE

Revenue passenger miles on the domestic airlines were estimated to be 6,284,800,000 in 1947, a five per cent increase over the 1946 figure of approximately 6,000,000,000. The estimated total above is derived from the sum of the actual operations for the first nine months plus an estimate of the last three months' operations. On the same basis, the revenue passenger miles flown by U. S. carriers on international runs totaled 1,890,000,000, a 71 per cent increase over 1946 operations.

Domestic route mileage of scheduled air transport operators rose 30 per cent over the 1946 figure. The mileage for the two years was, respectively, 110,000 and 84,358 miles. The average trip per passenger dropped slightly from 487 miles in 1946 to 476 miles in 1947. International route mileage, however, increased less than two per cent, the statistics being 178,768 miles for 1947 and 175,488 miles in 1946. The stability of the present international networks is apparent when it is recalled that in 1946 the international route miles increased approximately 64 per cent. The average length of a trip in international traffic increased from 1,060 miles to 1,335 miles.

Domestic air freight ton mileage soared to 40,702,000, an increase of 111 per cent, the most outstanding performance of the year. Domestic air express gained 26 per cent, with a total of 30,000,000 ton-miles for the year. The combined ton-miles for air freight and express in international transportation also increased by approximately 127 per cent.

At the end of the year there were 961 aircraft in use on both domestic and international routes, an 18 per cent increase over the 816 in use in 1946; 793 were used in domestic operations and 168 in international operations. Available seat miles increased 28 per cent and 102 per cent, respectively, in the domestic and international operations, with corresponding drops in load factors.

PASSENGERS, SCHEDULES, AND EQUIPMENT

The number of revenue passengers carried during 1947 in both domestic and international operations was 15,700,000, an increase of 18.5 per cent. The phenomenal increases in passenger traffic, developed as a result of the emergency transportation situation during the war, have been more than sustained. Some idea of the magnitude may be obtained by reference to 1940 statistics. In that pre-war year, 3,185,278 passengers were carried on all routes. The operations for 1947 represent almost a 400 per cent increase for this period of eight years.

The revenue passenger load factor in domestic services slid to 64 per cent, compared with 78 per cent the previous year. It is interesting to note that the corresponding figure for 1940 was 59.7. The break-even point for most carriers is usually somewhere between 60 and 65 per cent, and it is quite evident that operations are dangerously close to marginal conditions.

Revenue passenger miles flown in the first nine months of 1947 totaled 4,592,117,000, compared with 4,374,692,537 and 777,716,304 for 1946 and 1940, respectively. The 1947 figure is almost six times that of 1940. An Air Transport Association analysis of domestic airlines operations for the first six months showed a ten per cent increase in revenue passenger miles, whereas Pullman passenger miles declined 45 per cent in the same period. Day coach travel and intercity bus travel also dropped 36 and 4 per cent, respectively.

The short haul 30-place Martin 202 went into operation during the year, as well as the DC-6. The latter was put in use by American Airlines, United Airlines, National and Braniff. With the voluntary grounding of these ships, the only four-engine ships in service were the converted C-54's and the Constellations. It is expected that the speedy DC-6's will be back in operation in the early spring of 1948. All operators have utilized the larger ships, in some cases on through flights, at slight premiums. With the grounding of the DC-6 airplanes, TWA became the only operator with a 300-mile per hour extra fare service from coast to coast. The 40-place Convair Liner is expected to make its debut on the networks some time in 1948.

AIR MAIL

Air mail ton mileage declined less than one per cent below the 1946 level, which was 32,000,000 ton miles. This was the only phase of the air transportation picture which did not wholly sustain its war-inflated volume. It will be recalled that the 1946 volume had dropped 50 per cent below the 1945 figure. However, the present level of activity is still slightly over three times that of 1940. The latest complete statistics available from the Civil Aeronautics Board show mail ton-miles for the fiscal year ended June 30, 1947 as 31,515,740 for the domestic lines and 9,441,318 for U. S. International routes.

The five-cent air mail first instituted in the last quarter of 1946 did not have the stimulating influence that was predicted. However, it may have had the effect of checking the 50 per cent reduction in 1946 operations. At the end of the year, most of the airlines had filed petitions for increased air mail pay boosts, pleading increased operating expenses due to labor, material, and fixed charge increases. Although air mail revenues represent approximately five per cent of the total revenue of the average operator, it is very often the decisive factor between a profit or a loss.

AIR FREIGHT

Air freight ton-miles reached approximately 100,000,000 in 1947, with 60 per cent of the total carried by the independents who were a development of the first post-war year. The biggest independent is Slick, which accounted for 18,000,000 ton-miles in the first ten months of the year. Total domestic air freight volume ran close to 15,000,000 ton-miles a month for the last two months of the year. American Airlines ran second, with 9,370,000 ton-miles for the ten month period. Freight ton-miles flown by the domestic trunk lines were 276 per cent above the 1946 figure for the period from January to August. Actual ton-miles flown for this period in 1947 totaled 17,048,969, whereas the corresponding figure for the previous year was 16,174,885.

Several of the independent operators virtually received recognition as salient factors in the air freight picture. In fact, the phenomenal expansion was virtually forced into existence by their pioneering all cargo efforts. James M. Landis, Chairman of the Civil Aeronautics Authority, commenting on the subject said:

"In December 1946, the volume of cargo carried by air was 1000 per cent more than that carried in January of that year. In 1947 the increase percentage-wise is not likely to be that large, but my guess would be that we will have tripled the amount of cargo carried in 1946. Rates for the carriage of this cargo in a two-year period have dropped from about 40 cents a ton mile to somewhere between 12 and 13 cents a ton mile—a figure that contrasts with 12.6 cents per ton mile for railway express. And this advance has been accomplished without the development of a cargo plane."

Considerable controversy between the uncertificated independents and three airlines led to a rate war in the summer of 1947. A general investigation of the air freight rate picture was ordered by the Civil Aeronautics Board. However, the reduced rates set by American, United, and PCA were sustained, and the argument that airline cargo tariffs are supported by mail subsidies was repudiated by the Civil Aeronautics Board. Finding that the cargo tariffs bear little relationship to the cost of service both in the case of the airlines and the cargo carriers, the Civil Aeronautics Board ordered the investigation in an effort to find some rational principles for rate establishment.

AIR EXPRESS

Air express ton-miles for the period from January to August totaled 18,082,942, a 39.83 per cent increase over the 1946 figure of 12,932,339. United Air Lines, Inc. led during this period, accounting for approximately 23.6 per cent. Transcontinental and Western Air, Inc. and American were second and third, with percentages of 19.4 and 17.2, respectively. All three added up to 60 per cent of the total for all operators. The history of air express has been that of a steady increase in volume each year regardless of economic conditions. Air express, like air freight, is regarded by many of the airline operators as their largest potential increase in revenue from now on.

The establishment in 1947 of Air Cargo, a ground service organization for handling freight and express for the certificated airlines, completed the vital link from door to airplane. Air cargo terminals were established as well as a more completely integrated system for all ground work incidental to air transportation.

FARES, REVENUES, AND EXPENSES

Aside from premium fares, the average fare per mile rose to 5.5 cents as a result of two ten per cent increases made during the year. Gross revenues were approximately 15 per cent above those of 1946 and over twice those of 1944. However, operating expenses increased more steeply, resulting in the worst deficits in airline history. The reduction in passenger load factor to a figure in the vicinity of 65 per cent from the wartime high of over 90 per cent was one of the most important variables in the picture of higher costs. Also contributing to the costs were wage increases, higher material costs, depreciation, and fixed interest charges on debts. The grounding of the DC-6 airplanes rushed some of the operators deeper into the red ink. However, stringent measures were taken to reduce expenses, and by late fall several of the largest operators had increased their operational efficiency to the highest standard since the war. Another factor in the picture was the reduction in volume of traffic in the last two months of the year, when the number of passengers carried dropped below the totals established for these months in 1946.

Several airlines requested upward revision of their air mail payments during the year. The requests were made in conformity with the intent of the Civil Aeronautics Act, which provides for a rate of mail pay adequate for a reasonable profit in the interest of national defense. At the end of the year, an automatic sliding scale method of rate determination was under consideration. A major criticism of the usual method of long hearings before any decision on rates can be made led to the conclusion that the rapidly changing conditions required a more elastic method for rate changing.

SAFETY

Domestic airlines' fatality reached a high of 3.21 per 100,000,000 passenger miles, as contrasted with 1.24 and 2.23 for 1946 and 1945, respectively. While the number of fatal accidents was less in 1947, the fact that larger planes were involved naturally resulted in a larger number of people killed per accident. The international lines did much better, with a rate of 1.08 per 100,000,000 passenger miles. This is particularly laudable in view of the 3.54 figure for 1946 operations. The President's Air Safety Board, at the end of the year, made several recommendations for increased safety in the air.

PRIVATE FLYING

A study by the Civil Aeronautics Administration, released in October, on the subject of private flying revealed that private and non-scheduled commercial aircraft flew 9,800,000 hours within the continental limits of the United States during 1946, more than five times the revenue hours of all the domestic scheduled airlines. Approximately 61 per cent was instructional flying, 17 per cent personal flying, 11 per cent business flying, and 10 per cent hired or other revenue-producing activities. The total volume was more than 2½ times that of 1942.

An average of 183 hours was flown by all private aircraft in the same

year. Aircraft used in instructional flying ran up an average of 261 hours, against 62 hours for those in personal flying and 68 in business. Those engaged in transportation for hire used 87 hours total, while those in other revenue-producing activities totaled 73 hours.

A survey also revealed that small aircraft—65 HP or less—comprised more than half the plane flying in 1946, and these did about 70 per cent of the flying. Furthermore, 75 per cent of the hours flown by the small planes were for training. In view of the fact that the year saw a distinct trend toward the four-place airplane, it is expected that the distribution for 1947 and 1948 will begin to change quite substantially.

The number of certificated pilots rose from 400,000 at the end of 1946 to an estimated 455,000 at the end of 1947. According to the year-end report of T. P. Wright, an Administrator of Civil Aeronautics, private pilot certificates issued during the year totaled 125,000, an increase of practically 100 per cent over 1946. The GI program was the biggest single reason for the record number of student pilot certificates issued—actually 200,000 for the year. Under this program the Government pays for flight training of ex-servicemen, and the net result has been that the number of pilots and student pilots has passed the half-million mark. Obviously this Federal expenditure has bolstered hundreds of aviation training organizations and associated industries.

A breakdown of the skill and the types of certificates issued for the month of August follows:

Student pilot certificates issued	17,549
Private pilot certificates issued	11,737
Commercial pilot certificates issued	500
Airline transport pilot certificates issued	99
Mechanic certificates issued	921
Ground instruction certificates issued	321
Private instruction rating certificates	647
Instrument rating certificates	130

Registered civil aircraft at the end of the year totaled an estimated 95,000, a 17 per cent increase over the 1946 figure of 81,002.

AIRPORTS AND AIRWAYS

Under the stimulus of the National Airport Program, the number of airports increased from a figure of 4,490 in 1946 to 5,850 at the end of 1947. This program got under way late in the year with 127 projects given final approval, costing $12,966,628. Of the projects approved, six were completed at the end of the year, and the rest were ready for processing into the letting of contracts or actually beginning construction. Of the 127, the majority are smaller airports with only five being modifications and improvements of airline terminals. As of Oct. 1, 1947, there were 5,431 airports in operation, of which 2,633 are commercial, 1,732 municipal, 182 CAA intermediate fields, 557 military fields, and others totaling 327.

Airway safety improvements were hampered considerably by a 55 per cent cut in funds for the establishment of new navigational aids. At the end of the year, this problem, as well as others associated with airline operations, was held in abeyance pending completion of a survey report by the Finletter Committee.

A survey was made in the early fall of a cross-country skyway planned for the use of private flyers. The objective was to establish the best marked skyway in the world from Los Angeles to Washington, D. C. "The air-marked route" skyway will be used solely for contact and will follow terrain best adapted to that type of flying. It will include points where non-scheduled service is most needed and where personal flying is popular. The two 40-mile paths of routes will be liberally dotted with air markers at conspicuous locations established by survey flights. An estimated 5,247 towns and cities along Skyway I routes will benefit by the project.

New air travel rules, designed to further the cause of increased safety, went into effect Oct. 8, 1947. Aircraft will be required to fly higher over buildings in cities and towns than heretofore, and flight within 500 feet of any person, vessel, vehicle, or structure is expressly forbidden.

Some of the rigid rules formerly confined to instrument flying will be part of the cross-country flight rules. Lower operating altitudes were specifically established for helicopters.

AIRCRAFT MANUFACTURE

Aircraft manufacturing was the only phase of commercial aviation that showed a large decline in operations. The production of commercial airplanes dropped to approximately 15,800 units, less than half the total production of 35,000 in 1946. The value of production, however, increased from a figure of approximately $171,000,000 in 1946 to $188,000,000 in 1947 as a result of delivery of larger and more expensive aircraft. The most significant development of the year in personal planes was the emergence of the four-place airplane as the leader in the various types produced during the year. The increased utility of the four-place plane, associated with its ability to cover longer distances in more comfort, made it the leader in the reduced manufacturing operations in 1947. The total number of three and four-place airplanes manufactured in 1947 was 7,415, whereas the two-place airplanes totaled only 6,789. Military airplanes delivered totaled approximately 1,562 units, principally fighter, bomber, and cargo types.

According to the Aircraft Industries Association the approximate loss to the major aircraft manufacturers totaled $100,000,000 before tax carry-back credits. The comparable figure for 1946 was $81,000,000.

The entire industry at the end of the year was awaiting the release of the Finletter report. This survey was made principally to insure a healthy operating condition for all aircraft manufacturing, as well as other phases of aviation. It was expected that the report would point out the need for longer-range programs, the prohibitively high cost of development, and the need for a longer-range program enabling the aircraft manufacturers to keep their skill in engineering and manufacturing available in case of a national emergency.

RESEARCH

Extensive research activities were concentrated to a large extent upon supersonic flight, and the climax was reached when the Bell XS-1 successfully flew through the sonic barrier. It was reported that several penetrations beyond Mach I (speed of sound) were successfully made by NACA test pilots. The importance of these flights can hardly be over-emphasized since they open up the vista of speeds in terms of a 1000 MPH and higher.

Allied activities were associated with the development of jet engines, ram-jets, and other types of jet propulsion power plants. It is quite evident that all future fighters will be of the jet or rocket engine type.

The Robert J. Collier Trophy, awarded each year for the most outstanding engineering performance, was awarded to Lewis A. Robert, NACA flight research engineer, for his development of an aircraft ice-prevention system. The system developed was the culmination of years of research, and it was demonstrated successfully in 1947 that the modern airplane can be flown through the worst icing conditions with safety.

A considerable portion of research effort was devoted to other aspects in the direction of improving the safety of airline operations. Both psychological and design problems pertaining to aircraft operations were the subject of study by the President's Special Board of Inquiry on Air Safety. This Board made several very extensive surveys and submitted recommendations indicating the direction in which research and development should proceed to effect greater safety in airline operations.

High speed aircraft research also included the systematic investigation of the effects of various configurations upon performance. The results and the nature of these tests, in most cases, were classified as confidential information.

A cross-wind landing gear suitable

for operation at single-strip airports was initiated for feeder type planes. Under the CAA's sponsorship, two contracts had already been successfully completed. These were with the Goodyear Aircraft Corporation to convert a Piper Cub and with the Fairchild Personal Plane Division of the Fairchild Engine and Aircraft Corporation. Other developments of the same type of castered wheel gear are proceeding at the Bellanca Aircraft Corporation and All-American Aviation.

DIVISION XIV

POPULATION AND MIGRATION

POPULATION STATISTICS

By Leon E. Truesdell
Chief, Population Division, U. S. Bureau of the Census

POPULATION GROWTH

The population of the United States on July 1, 1947, including persons in military service abroad, was estimated at 144,016,895. This figure represents an increase of 2,778,202, or 1.97 per cent, over the estimate for July 1, 1946. This increase is decidedly the largest recorded for any recent year, exceeding the previous maximum of 1,832,815 established in 1943 by more than 900,000.

These estimates are presented for July 1 each year from 1940 to 1947 in Table 1, together with estimates for each month of 1946. The estimates of population for dates subsequent to the 1940 Census are based on statistics of births, deaths, and net immigration, which are also presented in Table 1. The data for births and deaths have been adjusted for underregistration, and the figures for deaths include deaths of servicemen overseas. The immigration figures represent net arrivals in continental United States, including arrivals from territories and possessions which amounted to about 56,000, mainly from Puerto Rico in the year ending July 1, 1947. The population estimate for July 1, 1947 represents an increase of 12,347,620 over the 1940 census figure. The increase in slightly more than seven years since the 1940 census thus exceeds by more than 3,400,000 the entire increase of 8,894,229 between the censuses of 1930 and 1940.

The chief source of the accelerated rate of population increase has been the wartime and especially the postwar increase in the birth rate. Though the birth rate declined somewhat between 1943 and the early part of 1946, there was a marked increase beginning in July 1946, and the rate has since continued at record levels, as indicated later.

The increase in population between 1946 and 1947 was made up primarily of the excess of births over deaths, which amounted to 2,558,120 though net immigration contributed 230,082, and has contributed around 200,000 for each of the last three fiscal years. Immigration is becoming more important as a source of population growth, as compared even with the earlier years of the postcensal period, though even in 1946-47 it represented only 8.3 per cent of the total population increase.

The figures representing net civilian immigration, as shown in Table 1, result from computations involving arrivals and departures of citizens as well as aliens. The data may be considered in three groups: (1) Alien immigrants and emigrants; (2) alien non-immigrants and non-emigrants, the latter comprising mainly temporary visitors, government officials, and persons in transit; and (3) citizens of the United States. The first group is the smallest, both in gross movement and in net residual. Figures for the whole period from April 1, 1940 to July 1, 1947 are as follows:

Arrivals	3,454,971
Immigrant aliens	442,050
Non-immigrant aliens	1,122,574
Citizens of the United States	1,890,347
Departures	2,439,109
Emigrant aliens	83,145
Non-emigrant aliens	852,342
Citizens of the United States	1,503,622
Excess of arrivals over departures (net immigration)	1,015,862
Immigrant aliens	358,905
Non-immigrant aliens	270,232
Citizens of the United States	386,725

It may be noted that, for the fiscal year 1945-46 (which is the latest for which these details are available), the total of 108,721 immigrant aliens arriving in the United States and its territories and possessions included only 29,095 quota immigrants. The remaining 79,626 non-quota immigrants included 47,679 wives of United States citizens and 29,396 natives of non-quota countries, mainly Canada and Mexico. It is important to keep in mind, especially in considering the probable trend of immigration in the years just ahead, the relatively small fraction represented by quota immigrants in the present total alien immigration, since the allowable quota is nearly 154,000, or more than five times the quota immigration of the year 1945-46.

Estimates of the civilian popula-

[1] Estimated total, including adjustment for under-registration.
[2] Net emigration.
* Preliminary figure.

tion, that is, the population excluding persons in the armed forces, are presented for July 1 of each year from 1940 to 1947 in Table 2, together with figures representing the number of persons in the armed forces. These figures show the effect of military inductions on the civilian population, that is, the population from which workers had to be drawn for war production; and then, later, the effect of the rapid demobilization. The net decreases in the civilian population shown for the earlier years in the period covered by the table represent the excess of inductions over natural increase and immigration. The military forces reached their maximum around midyear 1945. Subsequent to this date, which falls in the period between V-E Day and V-J Day, the process of demobilization was very rapid, and mainly through the absorption of ex-servicemen the civilian population increased between July 1, 1945 and July 1, 1946 by 10,942,426, in sharp contrast with the record for the year ending July 1, 1943, during which the civilian population decreased nearly 3,500,000 by reason of the large number of inductions which took place during that year. Between July 1, 1945, and July 1, 1946, the number of persons still in the armed forces decreased to 2,834,219, and still further to 1,373,860 on July 1, 1947, with a little further decrease between that date and the end of 1947.

All of the estimates in Tables 1, 2, and 3 are presented to the last digit as computed instead of being rounded, not because they are assumed to be accurate to the last unit but for convenience in summation.

BIRTH AND DEATH RATES

As already indicated, the recent increase in the birth rate has been the principal factor in the acceleration of the rate of population growth. During the calendar year 1946 there were 3,441,510 births, according to the records of registered births adjusted for under-registration. This number is materially larger than the previous maximum of 3,158,593 recorded for 1943. The number of births which occurred in the second half of 1946 was far greater than the number in the first half (2,017,255 as compared with 1,424,255). In fact, the rates prevailing during the last three months of 1946 were higher than any rates recorded since the beginning of birth registration in 1915. During the first few months of 1947, according to provisional figures, there was a moderate decline in the birth rate, followed by appreciable increases beginning in June.

On the basis of these preliminary figures, it was predicted that the number of births in the calendar year 1947 would exceed 3,900,000, or more than 500,000 above the previous record established in 1946. This record-

TABLE 2

TOTAL AND CIVILIAN POPULATION OF THE UNITED STATES AND NUMBER OF PERSONS IN ARMED FORCES: 1940 TO 1947

Date	Total Population Including Armed Forces Overseas	Civilian Population			Persons in Armed Forces
		Total	Increase (+) or Decrease (−) Since Preceding Date		
			Number	Per Cent

July 1, 1941.......	133,202,873	131,557,730	−101,556	−0.1	1,645,143
July 1, 1940.......	131,970,224	131,659,286	—	—	310,938

breaking number of births, in turn, doubtless results from the reuniting of families broken by the war and the high post-war marriage rates. The increase in the number of births recorded during the months subsequent to July 1, 1946, followed somewhat similar increases in the number of marriages recorded about a year earlier; and the statistics on marriages (see discussion pp. 593-5) indicate that relatively high birth rates are likely to be continued through at least the major part of 1948.

While the birth rate in recent years has reached very high levels, the death rate has shown no tendency to increase, being in fact appreciably lower in 1946 than ever before and promising, on the basis of preliminary monthly returns, to be at least no greater in 1947.

The trend of birth and death rates since Jan. 1, 1947 is indicated by the provisional returns for the first ten months of 1947, these figures representing specifically registered births without the adjustment for under-registration which was included in the figures quoted in the preceding paragraph. The birth rate for the ten-month period January to October 1947, computed on an annual basis, was 26.2 per 1,000 of the population,

TABLE 3

BIRTHS AND DEATHS IN THE UNITED STATES: 1920 TO 1946

(Registrations for years prior to 1933 are for the current registration area. The birth registration states in 1920 included 59.7 per cent of the total population of the country and the death registration states 80.9 per cent, these areas gradually expanding until complete coverage was attained in 1933)

Year	Births Registered		Deaths Registered		Estimated Totals, Including Adjustment for Under-registration		
	Number of Births	Rate Per 1,000 Pop.	Number of Deaths	Rate Per 1,000 Pop.	Births	Deaths	Excess of Births Over Deaths
1946	3,260,000*	23.3	1,395,617	10.0	3,441,510	1,412,974	2,028,536

* Provisional figure.

as compared with a rate of 22.1 for the first ten months of 1946. This comparison somewhat understates the change between 1946 and 1947, since the last two months of 1946 carried rates far higher than those for the earlier part of the year. The death rate for the first ten months in 1947 was 10, or very slightly more than the rate of 9.9 recorded for the same period in 1946.

The long-term data on births and deaths are summarized in Table 3, which gives for each year from 1920 to 1946 the number of registered births and deaths as recorded by the National Office of Vital Statistics of the United States Public Health Service, the annual rates per thousand of the population, based on registered data, and estimated totals including both adjustments for under-registration and, for years prior to 1933, estimates for non-registration states; and in the final column the excess of births over deaths, frequently termed the natural increase.

POPULATION BY STATES

Estimates of the population, excluding persons in military service overseas, have been made by states for July 1 of each year since 1940. These estimates are based partly on the projection forward of the 1943 estimates of civilian population based on ration book registrations and partly on current local data. In the estimates for July 1, 1947, which are presented in Table 4, some use was made also of the results of a sample population survey made in April, 1947.

By and large, the increases represented by the estimates for July 1, 1947 indicate that the changes brought about by the concentration of war production effort in certain areas had been maintained up to that date. The increase from 1940 to 1947 in the population, excluding military overseas, for the United States as a whole was 8.9 per cent. Eighteen states and the District of Columbia show rates of increase higher than this, while 11 states show actual decreases. These 11 states are for the most part in the dust-bowl area, which had lost population even before 1940, though the list includes also West Virginia, Kentucky, Alabama, and Mississippi.

The highest rates of increase are shown for certain of the far western states. East of the Mississippi, the District of Columbia, Florida, Maryland, Michigan, and Connecticut are the only areas showing an increase in excess of 15 per cent.

The changes which have occurred since 1940 in the distribution of the population by states will doubtless have an appreciable effect on apportionment in Congress, unless there should be extensive changes in reverse direction between now and the time of the decennial census in 1950. Informal computations based on the 1947 estimates indicate the following changes in apportionment: California would gain seven representatives; Michigan, two; and Florida, Indiana, Maryland, Oregon, and Washington would each gain one. On the other hand, New York would lose three representatives, Pennsylvania, two, and Arkansas, Illinois, Kentucky, Mississippi, Missouri, New Jersey, North Carolina, Oklahoma, and Tennessee would each lose one.

MARRIAGES

The most satisfactory current index of the trend in marriages in the United States is found in a series of monthly releases representing the number of marriage licenses issued in cities of 100,000 or more which is published (usually within 30 days of the end of the month to which the figures relate) by the National Office of Vital Statistics. The cities represented in this series contain about one-third of the population of the country, and, while increases and decreases in the number of marriages in the United States as a whole have not always followed exactly the same pattern as the figures for those cities, the trends are close enough to make the city data a fairly safe basis for forecasting the national figures, which do not become available until some

TABLE 4

POPULATION OF THE UNITED STATES EXCLUDING ARMED FORCES OVERSEAS, BY STATES, 1947 AND 1940

March	46,110	51,147	−9.8
February	43,342	59,809	−27.5
January	52,171	62,495	−16.5

The increase from an average of 47,441 marriage licenses per month in 1945 to an average of 64,104 per month in 1946 affords a measure of the tremendous increase in the number of marriages immediately following the war, though marked increases were in evidence in the last two or three months of 1945. The average number of marriage licenses issued in these cities during the first 11 months of 1947 was only 56,922, representing a very considerable decrease as compared with 1946 but still about 20 per cent above the average for 1945. Individual months from October 1945 to September 1946 show increases over the same month a year earlier ranging from about 20 per cent to more than 60 per cent. The last month to show an increase on this basis was November 1946, with an increase of 8.1 per cent. Beginning with December 1946, the monthly figures indicate decreases averaging 12 or 13 per cent as compared with the same month a year earlier, though for every month the 1947 figure is much higher than the average for the five years 1941 to 1945.

The number of marriages performed in the United States increased rather gradually from 1,331,000, or 10.3 per 1,000 of the population, in 1938, to a record figure of 1,772,000, or 13.2 per 1,000 of the population, in 1942, ranged slightly lower for the next three years, but then, following the pattern of the changes just discussed in connection with the figures for the larger cities, attained an all-time record figure of 2,286,000, or 16.2 per 1,000 of the population in 1946. At this writing (January 1948), complete reports for the United States are not yet available, but it is estimated (unofficially) that the 1947 total will be in the neighborhood of 2,000,000, and the rate around 14. Marriage data for the United States from 1937 to 1947 are presented in Table 6, together with parallel figures for divorces.

The number of divorces has increased in recent years even more rapidly than the number of marriages, namely, from 244,000 in 1938 to 613,000 in 1946. The number of divorces per 100 marriages taking place in the same year increased from 16.5 in 1940 to 30.8 in 1945 and 26.8 in 1946, the 1946 figure being somewhat lower than the rate for 1945 in spite of the rather large increase in the actual number of divorces, because of an even larger increase in the number of marriages.

POPULATION BY AGE AND SEX

The general trend of the population toward an age distribution in which the older ages represent a larger and larger proportion of the total has been modified in the years subsequent to 1940 by the unexpectedly large numbers of births which have taken place in the war and post-war years. The population under five years of age increased from 10,542,000 in 1940 to 13,417,000 on July 1, 1946, a gain of 2,875,000 or 27.3 per cent, as compared with a gain of only 7.3 per cent in the population as a whole. As a result, this group represented 9.5 per cent of the total population in 1946, as compared with 8 per cent at the

TABLE 6

MARRIAGES AND DIVORCES IN THE UNITED STATES: 1937 TO 1947

(Figures are estimates, except for the years 1937 to 1940)

Year	Marriages		Divorces	
	Number	Per 1,000 Population	Number	Per 100 Marriages
1947*	2,000,000	13.9	—	—
1946	2,286,000	16.2	613,000	26.8
1945	1,603,000	11.5	494,000	30.8
1944	1,452,000	10.5	400,000	27.5
1943	1,577,000	11.6	359,000	22.8
1942	1,772,000	13.2	321,000	18.1
1941	1,696,000	12.7	293,000	17.3
1940	1,596,000	12.1	264,000	16.5
1939	1,404,000	10.7	251,000	17.9
1938	1,331,000	10.3	244,000	18.3
1937	1,451,000	11.3	249,000	17.2

* Preliminary unofficial estimate, based on percentage of increase in licenses issued in cities of 100,000 or more.

time of the census in 1940. A later estimate, based on a sample survey made in April 1947, indicates a further and even more rapid increase between 1946 and 1947, amounting to more than 900,000, which brings the percentage of total up to 10.

On the other hand, the age groups 10 to 14 and 15 to 19 years, showed substantial losses between the census date and July 1946, mainly as a result of the decline in the birth rate through the late 20's and early 30's. These two groups together represented only 15.6 per cent of the population in 1946, as compared with 18.3 per cent in 1940.

The population at the upper end of the age scale continued to increase at a rate two or three times that of the total population, persons 65 years old and over forming 7.3 per cent of the population in 1946 as compared with 6.9 per cent in 1940.

As a consequence of the continued high rates of increase for the older age groups, the median age of the population continued to rise in spite of the unusual gains in the numbers of persons under 10. The median age, that is, the age which divides the population into two equal groups, one-half being under and one-half being older than the median, was 29.9 in 1946 as compared with 29 in 1940. The sample inquiry for April 1947 indicated a further increase to 30 on that date.

The 1946 estimates for the total population classified by age and sex are presented in Table 7 with 1940 figures for comparison.

In 1910 there were 2,692,288 more males than females in the population of the United States, the sex ratio, that is, the number of males per 100 females, being 106. This excess of males, which resulted largely from the heavy immigration during the years just preceding 1910, has been gradually declining until, about October 1945, the number of females "caught up" with the number of males. The number of females has gone on increasing until, in 1946, it exceeded the number of males by about 470,000, and the sex ratio was only 99.3. This low ratio came about partly because of military losses and partly because of the continued higher death rate for males than for females at equivalent ages. Since there is reason to believe that the gap between male and female mortality rates will narrow in the future, the sex ratio is not expected to fall much further before beginning a gradual rise, though it is not expected that there will again be an excess of males in the population. By way of caution

it may be noted, however, that the present and prospective excess of females is utterly too small to have any perceptible effect on the marriage prospects of women in the population.

MARITAL STATUS

Figures indicating the distribution of the civilian population by marital status, based on a sample survey made in April 1947, are presented in Table 8, with 1940 census data for comparison. In comparing figures for males and females as presented in this table one should keep in mind the fact that there are still more than 1,200,000 men, largely single, in military service.

The effect of the increased number of marriages which have taken place in recent years is definitely shown in these figures, the percentage married for females 14 and over having increased from 59.5 in 1940 to 64.2 in 1947. The corresponding increase for males, from 59.7 to 66.2 per cent, is somewhat exaggerated by the absence of considerable numbers of single males from the civilian population. The numbers of divorced persons, both male and female, increased at a much more rapid rate than the numbers of those married, though the actual figures involved were relatively small.

EMPLOYMENT

On the basis of reports obtained each month from a representative sample of about 25,000 households in various parts of the country, there have been published every month, since March 1940, estimates of the number of persons in the civilian labor force, the number employed, and the number unemployed. These figures are summarized month by month or for quarterly intervals from July 1945 to December 1947, in Table 9.

The effects of the rapid demobilization of the armed forces following midyear 1945 appear in the increase of more than 10,000,000 in the civilian population between July 1945 and July 1946. The increase in the civilian labor force fell far short of this figure, partly because of withdrawal

from the labor market on the part of large numbers of women and some students and elderly men who had been employed in the war industries, and partly because many ex-service men did not get into the labor market immediately on discharge.

The civilian labor force reached the high point of 62,664,000 in July 1947, at which time more than 60,000,000 were employed. The normal seasonal decline in agriculture brought these totals down by about 3,000,000 during the second half of the year until, in

September 1947	106,329,000	60,784,000	57.2	58,872,000	1,912,000	3.1
August 1947	106,238,000	61,665,000	58.0	59,569,000	2,096,000	3.4
July 1947	106,133,000	62,664,000	59.0	60,079,000	2,584,000	4.1
April 1947	105,730,000	59,120,000	55.9	56,700,000	2,420,000	4.1
January 1947	105,250,000	57,790,000	54.9	55,390,000	2,400,000	4.2
October 1946	104,590,000	58,990,000	56.4	57,030,000	1,960,000	3.3
July 1946	103,650,000	60,110,000	58.0	57,840,000	2,270,000	3.8
April 1946	102,290,000	56,450,000	55.2	54,120,000	2,330,000	4.1
January 1946	99,780,000	53,320,000	53.4	51,020,000	2,300,000	4.3
October 1945	95,040,000	53,170,000	55.9	51,610,000	1,560,000	2.9
July 1945	93,290,000	55,350,000	59.3	54,400,000	950,000	1.7

December 1947, there were 59,590,000 in the civilian labor force and 57,947,000 employed.

The number of unemployed has fluctuated around 2,000,000 during the post-war period, the number returned as unemployed in December 1947 being 1,643,000, or 2.8 per cent of the labor force. This figure was about the same as in November, but about 500,000 below the level of December 1946. Even in December, however, which represents approximately the bottom of the seasonal cycle, the whole number of persons in the labor force, including persons in the armed forces, was estimated at 60,870,000, or about 500,000 higher than in December 1946.

Because most of the seasonal variation in employment takes place in connection with agriculture, figures are presented in Table 10 showing separately, for 1947, by months, civilian employment in agriculture and in non-agricultural industries. These figures indicate an almost continuous increase in the number of persons employed in industries other than agriculture, the total increasing from 48,890,000 in January to 50,985,000 in December. The number of persons employed in agriculture, however, increased from 6,500,000 in January 1947 to a maximum of 10,377,000 in June, with only a slight decline in July and then a gradual falling off from month to month to a figure of 6,962,000 in December.

With the continuing expansion of non-agricultural industries during the year, civilian employment reached record high levels in 1947. The average number of persons employed in civilian work during 1947 was about 58,000,000, of whom about 49,750,000 on the average were employed in non-agricultural industries and 8,250,000 in agriculture. Non-agricultural employment was about 2,750,000 above the 1946 average, while agricultural employment remained about the same.

Non-agricultural employment, which passed the 50,000,000 mark for the first time during the last half of 1947, was well above the wartime peak and about 30 per cent higher than the 1940 pre-war average. The number of women employed in non-agricultural industries, however, was about 2,000,000 less than in 1944.

TABLE 10

CIVILIAN EMPLOYMENT IN AGRICULTURE AND IN NON-AGRICULTURAL INDUSTRIES, BY MONTHS: 1947

Month	Total Employed	In Non-Agricultural Industries	In Agriculture	
			Number	Per Cent
December	57,947,000	50,985,000	6,962,000	12.0
November	58,595,000	50,609,000	7,985,000	13.6
October	59,204,000	50,583,000	8,622,000	14.6
September	58,872,000	50,145,000	8,727,000	14.8

February	55,520,000	48,600,000	6,920,000	12.5
January	55,390,000	48,890,000	6,500,000	11.7

AMERICAN INDIAN AFFAIRS

By D'Arcy McNickle
Office of Indian Affairs, Department of the Interior

GENERAL

The year 1947 was a critical one for the Indians of the United States. The population continued to increase at a rate exceeding the rate for the United States as a whole. Indians today are estimated at 398,050 in the continental United States and perhaps 35,000 in Alaska. The resources available to the members of the various tribes (numbering approximately 200) are far from adequate, and can be added to in piecemeal fashion only. There is considerable room for improvement in the use of existing resources, as credit facilities can be made available and as the Indians find incentive to use land themselves instead of leasing it to non-Indians.

As the 75,000 Indians who were away in the armed services (better than 30,000) or in war work (about 45,000) return to their reservations, the problem of obtaining a livelihood becomes acute on some reservations, particularly the great Navajo area. Late in the fall, the need for additional relief funds on the Navajo and elsewhere was widely publicized in the public press.

INCREASED POPULATION, DECREASED LAND RESOURCES

A quick survey of Indian resources and the uses made of them will explain why today's conditions exist. In 1890, when the Indian population amounted to 245,000, the land in Indian ownership was in excess of 104,000,000 acres. Today, with an Indian population of close to 400,000, only 56,000,000 acres are owned by Indians, and this remainder is almost without exception the poorer part of the land which belonged to them in 1890. Of this area, the Indians use about 40,000,000 acres, including 15,000,000 acres in forest and woodland, some of which is grazed and the rest devoted exclusively to timber growing; non-Indians operate, under lease and permit arrangements, 13,500,000 acres of the land.

THE AGRICULTURAL PROBLEM

The basic source of livelihood for Indians is derived from agriculture, including livestock operations. Some 44,000 Indian families derive income from farming activities, and have an average annual income of $918 per family. This is gross income, including the value of farm products consumed in the home. In contrast, the net income of non-Indian farmers, after the payment of taxes and operating expenses, amounts to $2,541, according to Department of Agriculture reports. If the Indians made full use of the grazing and farm lands now used by non-Indians, an additional 17,500 families could be provided with a minimum income of $1,200 per family. This would come close to supplying a livelihood for 60,000 families, or nearly the total number who might be expected to turn to agriculture as a means of livelihood.

It is not the purpose to insist on agricultural activities for the Indian population, although the Indians are predominantly rural and doubtless will continue so for some time to come. The 1940 census returns show that only nine per cent of all Indians enumerated were living in urban areas. This percentage has not varied noticeably in the past 30 years.

The rehabilitation of a people as impoverished as was the greater part of the Indian population comes slowly. Since 1934, when funds became available from various sources for credit operations, for land acquisition, for the construction of additional irrigation facilities, the development of stock water range, and forest improvements, road construction, soil conservation practices and similar projects, the economic conditions of many Indians have improved markedly. Agriculture extension work, vital to the rehabilitation of any rural area, was not organized on a professional basis until 1930, and credit facilities of an adequate nature were not available until 1935. Much of what has happened since then is reflected in the livestock operations carried on by the Indians. In 1932 Indians owned 170,800 beef cattle, and by 1946 these herds had increased to 382,300. Dairy cattle also increased from 11,300 to 50,000 head. Not only was there an increase in numbers but the grade and quality of all livestock was brought to high standards. Income from livestock alone during those years increased from $1,300,000 to more than $21,000,000.

OPERATIONS OF THE REVOLVING CREDIT FUND

A revolving credit fund was authorized by the Indian Reorganization Act (Act of June 18, 1934) and an amendment adopted in 1936, in a total amount of $12,000,000. The actual amount appropriated for lending operations under this authorization amounts to $5,323,400. As loans are repaid into the fund the money becomes available for relending without further appropriation by Congress. Altogether, $12,927,290 has been loaned in cash since the program was inaugurated. The effectiveness of the program, from a banking point of view, is indicated in the delinquency rate. Of $5,630,937 which was due in 1947, only $18,925 was delinquent, or less than .3 of 1 per cent. Supplementing these cash loans, the Federal Indian Service has a revolving cattle pool which originated with breeding cows obtained in 1934 and 1935 under the drought relief program. Altogether, a herd of 42,000 head was obtained and distributed to loan clients, to be repaid in kind. Up to the present, a total of 122,750 head has been loaned to Indians.

EDUCATION

The Indian Service operates 18 nonreservation boarding schools, 31 reservation boarding schools, 157 day schools, nine special schools in isolated communities in Oklahoma, and 25 special consolidated schools. Approximately 60,000 children having more than one-fourth degree of Indian blood are provided for, half of this number being enrolled in public schools and the remainder in the Federal schools listed above. The poverty of the Indian population is closely related to the problem of education. Too few Indians have received even a basic education, owing to lack of incentive on their part or to lack of facilities available to them. It is estimated, for example, that 20,000 Indian children of school age are out of school because there are neither buildings nor teachers to take care of them. The greater part of this shortage occurs on the Navajo Reservation, where facilities exist for about 5,000 children, when 24,000 children of school age are on the reservation.

The effectiveness of the Federal schools was the subject of a special research project carried out by the University of Chicago over a period of several years. The results in summary show the following: (a) whereas in 1928 only 6 per cent of the Indian students in Federal schools were in the grade in which they belonged on an age basis, 36 per cent of the students were so graded in 1946; (b) in 1928 four-fifths of all Indian students were more than one year retarded, whereas two-thirds of them were either advanced or were less than one year retarded in 1946; in 1924 only one school offered 12 grades of instruction; this number increased to 12 in 1934, and to 37 in 1944. The study also brought out, what one might expect, that the more education Indian parents have, the longer their children remain in school.

HEALTH SERVICES

More adequate health services are urgently needed by the Indian population particularly for the control of tuberculosis, the prevention of communicable diseases, reduction of infant mortality, and improvement of home and community sanitation. In the health field, as in the field of education as well, poverty is again the underlying problem. Indians who are inadequately clothed, housed, and fed are easily victimized by disease. The Indian Service operates 68 hospitals in the states, with a total of 3,728 beds, and eight hospitals in Alaska with 424 beds. According to present indication there is immediate need for an additional 800 beds for tuberculosis care, 50 full-time physicians, 130 full-time dentists, and 50 public health nurses—or the equivalent in contract services supplied by private institutions. The need in Alaska alone runs to 160 beds for general medical and surgical care and 500 beds for tuberculosis with 10 full-time physicians, 15 dentists, and some nurses.

A report issued in November 1947 on a tuberculosis control program, utilizing BCG (Bacillus Calmette-Guerin), contained tentative conclusions of considerable interest. The program was started in the summer of 1935 in the course of which more than 3,000 Indians were examined, half of them inoculated with BCG and the other half kept under observation as a control group, without inoculation. Out of 1,583 persons vaccinated, at the end of 11 years, 55 deaths had occurred of which six were caused by tuberculosis. Of the 1,460 persons in the control group not vaccinated, 108 deaths had occurred, 52 caused by tuberculosis. The immunity produced by the BCG vaccine has persisted at a rate in excess of 90 per cent for 11 years. In this respect the vaccine compares favorably with the rate of immunity induced by smallpox vaccination.

ADMINISTRATION

The act of August 8, 1946 (Public Law 687), authorized the Secretary of the Interior to delegate such of his powers and duties as he might deem appropriate to the Commissioner, and the latter official in turn to make suitable delegations to district directors and reservation superintendents. Under this authority the Secretary delegated to the Commissioner final authority to act in certain matters relating to health and welfare, fiscal affairs, education, lands and minerals, irrigation, and forestry and grazing.

In transmitting these delegation orders to his field officers, the Commissioner wrote: "I am more convinced than ever that we must get closer to the people if our programs are to yield the greatest benefit to the Indians and the country. We must constantly strive to have greater participation by the Indians in the initiation, formulation and execution of our policy work.

"There should be a real sharing of ideas about goals and how to reach them and their (the Indians') views as well as those of the entire staff of the Service should be weighed and considered. Our programs, moreover, must be coordinated and integrated with other Interior programs and those of other governmental units as well as those of local civic groups if we are to achieve maximum accomplishment."

DIVISION XV

SOCIAL PROBLEMS AND CONDITIONS

PUBLIC SOCIAL WORK AND WELFARE

By Howard L. Russell
Director, American Public Welfare Association

INCREASED CASE LOADS AND COSTS

Public welfare agencies during 1947 were faced with increasing case loads and greater expenditures. During the war years, case loads decreased as many persons of marginal employability found steady or part-time work. With the end of the war and the return of veterans to the labor market, these marginal workers were pushed out of the labor pool, and many were forced to seek public assistance. Expenditures for public aid were greater because of the increased case loads, but a more dominant factor causing increased costs was the upward trend throughout the year of the cost of living, especially the essentials of everyday life.

One of the most difficult tasks facing public welfare administrators during 1947 was to keep assistance grants abreast of constantly rising living costs. Food represents a higher proportion of the total budget of assistance families than of any other population group. Handicapped persons depending on public aid for their basic necessities of life are affected most by inflationary trends, and are particularly hard hit by rising food costs.

REVIVAL OF INTEREST IN PUBLIC WELFARE

Because of its great expenditures and its direct effect on the daily lives of millions of people in the population, there has always been considerable interest in the public welfare program on the part of state and national legislators and the general public. During the war years, because the entire attention and energy of the country was devoted to bringing the conflict to a successful conclusion, not much attention was paid to the public welfare program. The year 1947, however, again saw the national and state legislators turn their attention to public welfare. Likewise, the interest of the press, as well as the attention of various organizations and groups was frequently focused on this field. The terms "public relations" and "interpretation" were again frequently heard in meetings of public welfare people. Interest in the public welfare program was greater than it had been since pre-war years and was frequently expressed in constructive debate on questions involving both policy and administration.

Equally significant during this year was the increased demand on public welfare agencies for help other than financial aid in treating social problems relating to housing, dependent and neglected children, lack of medical care, and family maladjustments. The need to provide social services served to emphasize the long continued shortage of trained and qualified social workers in the public welfare field.

FEDERAL WELFARE LEGISLATION

Much of the attention of Congress and its committees during 1947 was naturally devoted to international problems. While a number of proposals were introduced concerning various aspects of the national public welfare program, no outstanding Federal legislation was enacted during 1947 in respect to the administration or financing of the public welfare program.

The 80th Congress did extend the provisions of the 1946 Social Security Amendments providing additional Federal financial aid in the three assistance categories until June 1950. As a result of a resolution passed by the Senate, the Senate Committee on Finance appointed an Advisory Council to make a complete study of the Social Security Program. A preliminary report of this committee is expected early in 1948, which will deal specifically with the problem of total coverage of workers and increased benefits under the Old Age and Survivors Insurance program.

STATE WELFARE LEGISLATION

Some 44 state legislatures met officially during 1947. Relations between public welfare administrators and legislative bodies were carried on against this backdrop of rising case loads and increasing expenditures. On the basis of objective forecasting, every state welfare department was obliged to present budget requests in an amount substantially larger than for the previous fiscal period. At least one-third of the state programs received all the financial support requested in their budget presentations. Among the remaining group, several state administrators were instructed not to lower assistance standards with a promise that, if deficits occurred, they would be made up at subsequent legislative sessions. In every state but two, actual appropriations in dollars were larger for the current fiscal period than for the past corresponding period. In no state was there a disposition or a proposal to deny the responsibility of government for handicapped people by wiping out any major assistance program.

STATE LEGISLATION AFFECTING GRANT LIMITS

The 1946 Social Security Amendments, which provided increased Federal financial participation in the three categorical assistance programs, had a decided influence in raising or eliminating the legal or administrative maximum limits upon grants. In September 1946, just before the effective date of the amendment, 96 of the 148 public assistance programs then in effect in the United States had such legal or administrative maximum limits. By the end of 1946, 60 of these 96 maximums had been raised and three eliminated.

State legislatures meeting in 1947 carried this trend still further, although in a few instances, ceilings were established where there had been none before. Three states in 1947 deleted legislative maximums; Maryland on Old Age Assistance, Iowa on Aid to Dependent Children, and Colorado on Aid to the Blind. In addition, ten states—California, Connecticut, Delaware, Florida, Indiana, Minnesota, North Carolina, Tennessee, Vermont and Wyoming—raised their maximums on Old Age Assistance. Seven states, California, Delaware, Florida, Illinois, Indiana, Maryland, and Tennessee increased the maximums on Aid to the Blind. Indiana, Minnesota, South Dakota, and Tennessee raised the maximums on Aid to Dependent Children.

In contrast, Delaware and Maine established legislative maximums for Aid to Dependent Children. Utah established legislative maximums on all three types of categorical assistance to replace the previous limits prescribed by administrative action. Legislative changes with respect to residence, for the most part, have been liberalizing in effect. Utah removed residence requirements for public assistance from the law. Minnesota and Wyoming reduced from five years to one year the residence requirements for Aid to the Blind.

Provisions relating to income and property, including lien provisions, were somewhat relaxed in Idaho, Maryland, North Carolina, and Vermont, but were made more restrictive in a number of other states including Indiana, Kansas, Oregon, Utah, and Washington. In Utah, liens are now required under certain circumstances. Indiana and Washington, which previously had no lien provisions, have now adopted them. Three legislatures—Indiana, Maine, and Washington—moved to emphasize the responsibility of relatives to support their needy kin. The citizenship requirement for Old Age Assistance in Vermont was abolished. Maryland repealed its statutory provisions for limiting the granting of ADC to children living in "suitable" homes.

STUDY AND REVISION OF WELFARE MEASURES

Financial support, important as it is, is not the only measuring stick of the extent of legislative interest. Broad legislative programs are often sponsored by state and local welfare agencies and, in contrast to appropriation measures, require several years of education and debate to make them effective. Wisconsin culminated some years of study by completely rewriting and recodifying all its welfare measures in seven major phases of legislation. The Illinois Public Assistance Laws Commission completed a thorough job in codifying the public aid laws of that state and had its proposed new law unanimously passed by the Senate, although it failed in the House. Utah, in spite of enacting some legislative restrictions, produced an excellent and basic assistance act. Vermont took a major step in welfare organization by combining its categorical assistance programs under one state agency. Several states with an eye to the imminence of new Federal social security legislation passed enabling acts making it possible for them to conform automatically to any new Federal requirements.

LOCAL PUBLIC WELFARE

Local public welfare agencies during 1947 felt the impact of increasing case loads, and available funds were strained by the need to increase individual grants because of rising living costs. Local governments, with their inflexible tax sources and faced with rising welfare costs, generally turned to state and Federal governments for financial aid. This desire for having large governmental units assume the increased cost of public aid is not accompanied by any desire to further centralize welfare administration at the Federal or state level.

The year 1947 brought an increased realization of the value and importance of having the local administration of all public welfare programs in a community centralized in one department. Such integration has as its objective the providing of better services to citizens of the community and also the effecting of economies in administration.

The uniform appearance of the problem of high grant cases in many communities represents, perhaps, the most difficult factor of recent years in the relationships of welfare administrators and legislators. The dilemma of public welfare workers, who would meet aid adequately at the risk of inviting legislative restrictions, is not easily solved.

PUBLIC ASSISTANCE

The upward trend in public assistance case loads, which began shortly after the end of the war, continued in 1947. The number of families and persons receiving public aid had decreased sharply during the war years, and it was expected that the case loads would show an increase at the conclusion of the war's hostilities. In some communities and states, the case loads have apparently returned to their "normal" level and are not increasing at the end of the year. In other states, however, case loads are still on the increase as 1947 draws to a conclusion.

During August 1947, a total of approximately 2,290,000 persons received Old Age Assistance. This figure represents an all-time high for this program. The previous peak was in June 1942 when 2,254,000 persons were receiving Old Age Assistance. The number of recipients of Old Age Assistance increased 7.6 per cent over the same month in 1946. Expenditures for this type of aid had increased 23 per cent over the same month a year ago and now totaled $83,000,000 for the month.

In August 1947, public aid on behalf of dependent children was given to approximately 400,000 families, including 1,027,000 children. This was an increase of 27 per cent over the number of recipients a year previous. Grants for this type of aid totaled almost $25,000,000 for the month of August 1947 which is an increase of 47 per cent over the same month of the previous year. The effect of the rapidly rising costs of living is shown in this expenditure figure.

The 79,000 blind persons receiving public aid in August 1947 represent an increase of 6.5 per cent over the year before. Payments to this group totaled about $3,000,000 in August which was an increase of 19 per cent over the expenditures in the same month of the previous year.

In August 1947, 330,000 families and single persons were being aided through general assistance funds, an increase of 19 per cent over the previous year. The grants to these cases in August were approximately $13,500,000, which was an increase of 39 per cent over the expenditures for the same time in 1946. For this type of assistance, the expenditures represent state and local funds only, in contrast to assistance to the aged, the blind, and dependent children where the Federal Government shares the cost.

SOCIAL INSURANCE PROGRAMS

The operations of the federally administered program of Old Age and Survivors Insurance and the state administered programs on unemployment compensation are importantly related to public welfare in their assumption of an increasing role in meeting economic need.

Monthly benefits under Old Age and Survivors Insurance have increased each year since the beginning of the program in 1940. Payments during the Federal fiscal year 1946-1947 totaled $426,000,000. During August, almost 1,900,000 persons were receiving benefits under this program at the monthly rate of about $38,000,000.

Benefit payments for unemployment insurance, on the other hand, rise and dip with every fluctuation in the general economic situation. Payments during the last Federal fiscal year under this program were $311,000,000 less than in the previous fiscal year.

The first nationwide program providing sickness and maternity benefits went into operation in July 1947 under the provisions of the Railroad Unemployment Insurance Act. Payments in the first month of operation were made to almost 10,000 cases for sickness and to 160 cases for maternity benefits. July also marked the first month in which reconversion unemployment benefits became payable to seamen who had served on Federal maritime vessels operated by the War Shipping Administration.

The availability of social insurance benefits has an appreciable effect on reducing the demands for public aid which would otherwise have been made on the public welfare agencies.

INSTITUTIONAL CARE FOR THE AGED

During 1947, pressure was constantly felt by public welfare administrators regarding the provision of more and better facilities for aged people who can not care for themselves. Homes for the aged, nursing homes, infirmaries for the chronically ill, convalescent homes, and other facilities are generally crowded, substandard, and in some communities entirely lacking.

As the percentage of the population in the aged group continues to increase there will be an increasing number of persons in need of some type of custodial, medical, or hospital care. Aged persons in need of such care generally seek such facilities in urban centers. The housing shortage has also complicated this problem of securing enough adequate facilities. Some states are authorizing the use of state and local funds for payment of Old Age Assistance grants to people in public institutions. This has followed the passing of enabling legislation, which promoted the conversion of suitable poor farm facilities into modern infirmaries. Many states are reviewing their licensing laws as a medium for raising standards in convalescent and nursing homes.

Local governments in most states bear almost the entire cost of public hospital care for the chronically ill and custodial care for the disabled and handicapped. Local government is least able financially to bear the cost of needed improvements and extension of institutional care. The year 1947 saw a continuation of the efforts to have state and Federal governments assume a greater share of the financial cost of providing this type of care.

CONCLUSION

In 1947, the number of persons receiving categorical assistance was equal to the number of persons receiving such aid before the war. Because of a sharp increase in the cost of living, especially in the basic essentials of food, clothing, and fuel, expenditures for categorical assistance were greater than just before the war. Continued inflation, particularly in food prices, constitutes the greatest threat to public aid programs that must carry out the intent of Federal and state laws to provide help to needy people on a basis of a decent and healthful standard. Increasing attention is being paid to administrative and social work techniques that will insure the maximum values from the use of the public welfare dollar.

PRIVATE SOCIAL WORK

By Robert E. Bondy

Director, National Social Welfare Assembly

GENERAL

The second year after the Second World War found private social work heavily affected by war's continuing aftermath and by the unresolved attempt to transfer ways of living to peacetime. The tensions and uncertainties of being neither at war or in peace underscored the lives of people and thereby conditioned the services and operations of private organizations existing for advancement of human wellbeing. Voluntary health, welfare, and recreation services were more than ever in demand.

Higher prices resulted in higher family budget costs. Budgets of private social work agencies were inevitably affected. It took more money than in previous years to render the same services. Physical plant repair and replacement deferred by war's priorities lagged, with physical plant further deteriorating in many situations. Increased costs put a damper on inauguration of needed new services.

The war weariness of people brought the reaction of reduced volunteer personnel being available for private services. Professional personnel shortages remained large and left many agencies with inadequate staffs. Where new services were provided in budgets, personnel shortages delayed their beginning. But removal of war's limitations brought successes. Annual conventions and regional meetings were renewed. Publication limitations were lifted. The tempo of activities became more reasonable. Ways of work carried fewer rigors.

New calls for unity and indivisibility in social welfare rang throughout the field of private social work. If America was to keep faith in a jumbled world, America itself must be strong in its human well-being. So new urges came to make social welfare through private organizations more effective and better integrated with public welfare and related interests in the nation's economic and political life.

PLANNING AND FUND RAISING

The year 1947 was the first full year of the National Social Welfare Assembly, Inc., organized as the central national organization for social welfare with 48 government and voluntary national organizations affiliated, and five associate groups. The Assembly combined lay and professional, government and voluntary, national and local social welfare interests for the furtherance of organized effort for human wellbeing.

Its functions are to facilitate more effective operation of organized social welfare, to study and define social welfare problems and human needs and develop plans of action to meet those problems and needs, and to act in behalf of social welfare, where representation of its interests is indicated. Wide participation in its committees and program of national organization and local community people is sought. The Assembly, on the one hand, serves and is a facility for the use of its affiliate national organizations; on the other hand, it gives service to the local community through guidance and program material and through joint national-local planning.

An important statement of understanding was approved in December by Community Chests and Councils, Inc. and The Assembly to obtain cooperation in planning and maintaining services to meet human needs. The Assembly is recognized as the central national planning body for social welfare, and Community Chests and Councils, Inc. as the national spokesman for state and local joint planning and federated support of social welfare services.

In order to avoid duplication in activities certain common interest activities are recognized as justifying the joint sponsorship of the two organizations, namely, national budgeting, citizen participation, and field service cooperation.

The National Health Council, which serves as the Health Division of the Assembly began a program of providing service to and extending the organization of local health councils.

National organizations in private social work were the pioneers in the development of many local and national social services and continue as a vital part in the American system of social welfare. Their fields of interest have become more specialized and yet broader, while their joining for cooperative activity through the National Social Welfare Assembly has demonstrated their recognition of a unitary part in the whole. They differ widely in function, structure, and financing, but have the common denominator of voluntary organization for social wellbeing. Their position as an indispensable of the whole has been strengthened during the year.

METHODS OF RAISING FUNDS

Central state organizations for social welfare took different forms in Massachusetts, Michigan, Arizona, Oregon, and North Carolina through an official procedure for licensing of appeals for money. In Massachusetts, a statewide voluntary service unites state and local bodies, and cooperates with national agencies, in behalf of better social service in local communities. Massachusetts, Michigan, Arizona, and Oregon are seeking to develop state chests to conduct federated money raising for state and national appeals.

This state development is significant as a link in the total chain of planning for adequate service through national, state, and local effort. Citizen groups are generally participating in these efforts, as in New Hampshire where the Citizen's Council has statewide representation of individuals and organizations. The combining of federated money raising with joint planning in states is discussed as the appropriate goal.

The organization of local communities for social welfare services through federating of local private agencies in community chest and councils of social agencies now reaches about half of the nation's population in over 900 chests. Almost 400 councils of social agencies now exist.

Fund raising through chests for private social work approximated $175,000,000 in 1947, with 102 per cent of the 1946 actual total raised in 1947, and about 97 per cent of the 1947 goal itself. This result reflects the holding and extending of the line of support.

The trends of federated money raising are decidedly upward. A study by Community Chests and Councils, Inc. of a typical group of chests showed appropriations to agencies for 1947 was 67.5 per cent above 1941 and 81 per cent above the 1935-39 average. The national promotion of local federated money raising under the Red Feather symbol, with the theme "Everybody benefits—everybody gives," was more widely extended through Community Chests of America, organized by Community Chests and Councils, Inc. A typical group of chests reported $2.53 raised per capita for 1947 budgets. The amount raised for local purposes increased 16.4 per cent from 1946 to 1947.

More chests included national organization budget needs, due to larger recognition of the oneness of social welfare and the desire of local contributors to support national services through chests. A study of more adequate financial support of national organizations by the National Social Welfare Assembly showed need for better interpretation of national agency services to local communities and need for a quota plan assuring equitable distribution of national appeals among local communities.

National budget review was extended through the National Budget Committee to more national organizations for the guidance of local communities.

Independent appeals for funds were made nationally and locally by a number of organizations, notably, the American Red Cross, National Tuberculosis Association, National Foundation for Infantile Paralysis, American Cancer Society, and National Society for Crippled Children and Adults with results in excess of goals sought or in excess of the total raised in 1946. The Red Cross raised about $80,000,000 on a goal of $60,000,000.

Discussion bordering on controversy occurred regarding the perennial issue of the joining of these independent campaigns with federated campaigns of chests. The result was a stalemate, the independent campaigns continuing and tensions mounting to the detriment of private social work. An accommodation whereby certain independent campaigns would continue, but be cooperatively related in timing to federated campaigns, seemed the immediate desirable objective.

Councils of social agencies gave more attention to the composition of the basic membership body, with a trend toward broader participation continuing. Closer integration of private and public agency interests through councils was studied and moved forward in some communities. Metropolitan area planning was furthered by the formation of a central council for Delaware, Montgomery, and Philadelphia counties in Pennsylvania.

Increased interest developed in the organization of neighborhoods as a means of wider citizen participation and of making health, welfare, and recreation services more readily available to people.

Social service exchanges for clearance among agencies serving individuals and families had increased interest in standards and eligibility requirements for member agencies. The review of case work procedures related to the use of the exchange was under discussion by case workers.

PUBLIC UNDERSTANDING AND PARTICIPATION

Recognition that private social work must have wide public understanding and participation made solid headway in 1947. The contributor and client of social agencies have continued to receive the spotlight of efforts to acquaint them with the financial needs and the services of the agencies themselves. Public relations plans to reach the general public for better understanding of the causes of social breakdown, as well as to obtain understanding and support of private social work have had wider acceptance.

Health services have long sought to teach prevention of disease. Welfare services are increasingly teaching prevention of social ills. This is the new goal. Trained public relations personnel and adequate training facilities are needed to further the work of public understanding.

Citizen participation has become the twin of public understanding. Wartime volunteer service has taught many people the need of volunteer service in agencies. Central volunteer bureaus in local communities in the main have held the position established during the war. Agencies have more widely recognized the need for such service. Training of volunteers has had more attention.

Beyond volunteer service in agencies, the participation of the citizen in national and local movements for the social welfare has had attention. Participation has brought understanding, probably more solid understanding than that gained merely through listening, reading, and seeing. The Committee on Citizen Participation of Community Chests and Councils, Inc. has become a new force for furthering plans for such citizen participation.

THE PROFESSION OF SOCIAL WORK

The effectiveness of private social work has been enhanced by the dual recognition of citizen participation and of competent professional service as requisites. Professional social workers are insufficient in number to meet the needs, and, as a corollary, there is a growing strength in the professional associations for the building of competence.

Matters having greater attention in the professional field include registration and licensing, perfecting of personnel standards, defining standards of professional competence and social work education, and concern with the place of social work in public and private fields and in international matters.

The inadequate financing of placement and counseling services in the Social Work Vocational Bureau resulted in proposals for assumption of responsibility by public employment services of certain placement and counseling functions and for the establishment under voluntary auspices of a central register of workers in all fields.

The professional schools of social work faced the shortage of competent workers by attention to the content of the undergraduate and the professional courses, to field work needs, to increased resources for professional training, to cooperation of operating agencies in arranging for training of staff, and to supplemental methods of training. The stake of the whole field of private social work in a bigger supply of competent workers becomes more widely recognized.

SERVICE TO INDIVIDUALS AND FAMILIES

Government carried the basic responsibility of material care and related service to people in need of human necessities through the Social Security and public welfare systems of Federal, state, and local governments. Private family and child welfare agencies continued as the means of demonstration of need, the supporter of government effort, and the vehicle for special and more intimate services not feasible for government to carry.

Family service agencies, in their primary role of the strengthening of family life, have dealt with the problems of family stresses growing out of post-war adjustments, strains from inadequate housing, and material problems attendant upon higher living costs. They have sought through varied means a wider education in family life and have given attention to improving the conditions for good family life and increasing the understanding of what these conditions are. There is wider acceptance of this responsibility. Joint planning with community organizations, civic bodies, and citizen groups has been furthered to serve this end.

CARE OF CHILDREN

The care of children in and out of their own homes had new emphasis during the year because of the necessity for many mothers to work. The withdrawal of Federal funds for day care has brought serious retrenchment in day-care facilities. Many communities have struggled to maintain these services.

The deeper understanding of wartime of the meaning of separation of children from their parents has stirred activity to make it possible for children to remain with their parents. It has been responsible for efforts to obtain more adequate funds for aid to dependent children and to widen the use of the funds. Indiscriminate use of institutions has decreased, and the shortening of institutional care has become a tendency. In adoption, there has been acceleration of study of the infant to achieve earlier adoption, and more thorough study of and preparation of the adoptive home as a safeguard to the child.

CARE OF THE AGED

Advances in care of the aged are evidenced by special attention to the subject in community surveys and increasing public awareness of the increasing age of the population calling for special attention to needs of the aged in employment, recreation, and care in individual homes.

The National Social Welfare Assembly study on the needs of the field of care of the aged resulted in recommendation for the establishment in the Assembly of a national clearing house of information on local programs and of advisory services to communities seeking guidance for plans in the institutional and non-institutional fields.

In individual communities, emphasis has been given to housekeeping services for the aged as special projects, central registry of vacancies in nursing homes, central projects to stimulate interest of agencies in older people, adaptation of financial entrance requirements of private homes to permit acceptance of residents receiving old age assistance.

In institutions structural and fire hazard reduction matters and the presence of the qualified attendant—all of them important—tend to crowd out attention to nutritional and human problems.

PROBLEM OF THE MIGRANT

The size of the moving or migrant population coming into or through communities in 1947 was larger than in the years between 1936 and 1940, the problems are more serious, relief needs are increasing, and local facilities are inadequate. Census Bureau reports and studies of the National Travelers Aid Association sustain these conclusions.

In order to help communities deal with this problem, the Social Case Work Council of the National Social Welfare Assembly has prepared a pamphlet, "Service to Migrants," intended to present some guidance of social case-work service to individuals or families faced with problems growing out of moving from one community to another. This statement is based on the fundamental principle that free movement is a basic right of the American citizen.

Agencies face obstacles in planning for the needs of migrants because of varying settlement laws, community attitudes resentful of migrant needs, and lack of services and facilities. There are heartening new recognitions of the right of freedom of movement of people.

LEGAL AID SERVICE

The needs of people for legal aid service have had wider recognition in 1947 in the campaign to extend organized legal aid services to cities of 100,000 population and over. The American Bar Association has spearheaded the movement in close cooperation with the National Association of Legal Aid Organizations.

Two types of difficult legal aid cases have predominated: family problems of divorce, separation, annulment, non-support and desertion, and evictions because of housing shortage.

SERVICEMEN PROBLEMS

The large part of the population made up of service and ex-service men and their families is a larger concern of private social agencies than formerly. The Red Cross camp and hospital services, therefore, render a significant service. Staff at able-bodied and hospital installations of the Armed Forces serve the men on personal and family problems, as do the chapter workers in behalf of the families back home.

New services were inaugurated in 1947 in a well-rounded recreation program for able-bodied men in the Army, and the hospital recreation program continues for the hospitalized. Service was expanded in behalf of servicemen in military prisons.

The Red Cross hospital service program in military hospitals is being adapted to peacetime, particularly in its individualization of service to each patient. Other organizations, including the National Jewish Welfare Board and the Y.M.C.A., are giving new attention to their army and navy service.

Whether the needs of the ex-service men arise from service or civilian life, the nation and the home community are responsible for assisting the veteran-civilian. Organized service is needed, of which the Government supplies much, but voluntary organizations—and they alone—can aid the veteran-civilian in the difficult adjustment he must make.

Principal service needs of the veteran and his family during 1947 were for housing, job placement, job and educational counseling, personal and family problems, job training, and service in obtaining veteran's benefits, such as claims, loans, and insurance.

AID IN DISASTERS

During 1947, the United States had the most destructive series of major disasters in history, according to Red Cross reports. Up to Dec. 1, there were 267 disasters requiring Red Cross aid.

Five major disasters were listed as follows: the worst tornadoes in ten years in Texas and Oklahoma in April; Texas City explosions and fire in mid-April that claimed 500 lives and caused over 3,500 injuries; June floods in seven midwestern and eastern states; severe Florida-Gulf states' hurricane and protracted floods in September; and devastating New England forest fires in October.

Disaster-caused deaths up to Dec. 1, totaled 1,266 in Red Cross records, twice the toll of 1946. Altogether, 7,969 persons were injured. Few parts of the country were spared in the disasters which struck 46 states and Alaska, including 141 fires, 50 floods, 41 tornadoes, three hurricanes, 21 other storms, 30 explosions, minor earthquakes, and wrecks.

Over $10,000,000 was expended by the Red Cross in disaster relief operations to assist 305,682 persons. In terms of costs, it was the peak year in Red Cross disaster work for the past decade.

INFORMAL EDUCATION AND RECREATION

The private agency in this field continues to provide varied types of leisure-time programs under trained leadership, which will enable an individual to learn skills, participate in group thinking and action, and have fun and enjoyment. The attention is on varied and quality group activities. These agencies serve people in all age groups, though some are limited to youth services. They have strengthened and increased their services in the following ways: by reemphasizing their broad educational aims as well as continuing their recreation programs for all age groups; by cooperative planning, specially on a neighborhood basis; by increasing coeducational activities for the older adolescent and young adult age groups; by establishing special services to certain groups, such as informal educational and recreation programs for the aged and programs for hospitals; by recognizing the value of mass activities as well as small group activities so that a varied community program for all age groups is presented.

Other trends particularly apparent in 1947 were: programs of education on world affairs, with particular reference to United Nations and UNESCO; emphasis on youth participation in planning their own activities and in cooperative community projects, expansion of self-governing youth councils, educational programs for youth with reference to pre-vocational training, vocational guidance for youth, special conferences of youth, such as the YMCA-YWCA Conference at Grinnell, Iowa, which are concerned with youth's interest in marriage and the home, the job, and service in the community; special emphasis on training of volunteer leaders and clear definition of board members' responsibilities; expansion of camping activities, with particular expansion in day camps in metropolitan areas; growth of associations of professional workers, and interest in training and education for this profession.

In the settlement movement, recent trends included: a noticeable change toward higher standards of professional education for settlement workers; more representative boards for settlements, including particularly representation from the neighborhoods served; closer working relationship between neighborhood houses sponsored by religious bodies and nonsectarian settlements and community houses; closer participation of settlements, neighborhood houses, and similar agencies in the National Federation of Settlements; and renewed effort to reestablish fellowship with settlements in Europe and to include Chinese community center workers in such fellowship.

Organized camping in 1947 served more individuals, and more camping enterprises were launched than formerly. Important developments in improved camping were noticeable. Standards for leadership personnel were raised. Camp programs were enriched through emphasis on the smaller group. Use of camp environment to facilitate a primitive type of living was made. Standards of health and sanitation were restored to prewar position. Young adults received wider attention in provision of camping facilities. A generally upward movement occurred regarding camp standards. Awareness of the need for more adequate training of camp personnel seemed more general. Camping accepted a new sense of its social significance, expressed in wider intercultural objectives.

HEALTH PROBLEMS

As in other fields of private social welfare, voluntary health agencies preserved the unique place of demonstrating the practicability of public health services in fields in which official health agencies have been slow to operate. Health problems have been kept continuously before the country by them. Experimentation with new procedures and exploration of new fields has proceeded.

New leadership was undertaken through the National Health Council, in which most of the national health agencies participate. The Council is serving local health councils and is now developing a plan to gain wider organization of public health departments in counties and local communities.

Proposals for federating the money raising appeals of national health agencies have had consideration in some quarters, but without result.

The importance and range of activities of the principle voluntary health agencies were shown in a 1947 review by the National Health Council and the National Social Welfare

Assembly of programs and special projects on which the interest and participation of the public and other organizations were desired. The following selective listing of some of the highlights of this study typifies the current interests of those organizations:

American Cancer Society.—Arousing the American people as never before to the danger of cancer and the need for seeking medical aid at the earliest sign of such danger. Financing a nationwide program of basic cancer research which in extent and coordination probably exceeds that ever launched against any disease. Providing hospitals and clinics with substantial aid in developing cancer detection centers and in increasing the services of cancer diagnostic and treatment clinics.

American Hearing Society.—Participation in activities of National Hearing Week. Continuation of present program of activities. Expansion of work in behalf of children. Promotion of hearing conservation programs in schools and help to secure state and national legislation for hard-of-hearing children.

American Heart Association.—National Heart Week participation. Participation in the health education of the public and in the general publicity on the problems of the no. 1 killer in this country.

American Public Health Association.—Development of interagency cooperative bodies for securing full time local health services for all areas of the United States.

American Red Cross.—Organization of voluntary blood-donor service throughout the country calling for participation of volunteer blood donors and volunteer workers. Wider use of society safety first aid, home nursing, nutrition, and other class instruction programs. Volunteer participation in hospital services in hospitals of the armed forces and in veterans' hospitals.

American Social Hygiene Association.—Annual Social Hygiene Day. Emphasis in 1948 will be on case-finding for the venereal diseases. Continuous support for maintaining public interest in pre-natal, pre-marital and V. D. laws and legislation designed to protect family life and national health in the matter of commercialized prostitution. Stimulation of community interest on school-community programs of sex education (family life education, education in health and human relations), by special educational surveys, consultation, research study of existing and growing programs in this field and by providing speakers for meetings concerned with this aspect of education. Support for community venereal disease control programs. Support of the Program of the Association's Committee on International Relations and Activities and of the Regional Office for the Americas of the International Union Against the Venereal Diseases which are integral parts of the Social Hygiene program carried on by the Association.

National Committee for Mental Hygiene, Inc.—Establishment and development of child guidance clinics. Establishment of vocational guidance processes for patients about to be discharged from mental hospitals. Joint participation in the development of the program for the International Congress on Mental Health in London in 1948.

National Foundation for Infantile Paralysis.—The inclusion in program calendars of public educational information programs on infantile paralysis. Recruitment drives for Polio Emergency Volunteers to assist physicians, nurses and physical therapists in the care of infantile paralysis patients in the hospital, clinic and home. Recruitment of volunteers to assist Chapters in the finding of old cases, through the Case Record Survey, who may benefit from further treatment. Adoption of projects in connection with the Chapter for the entertainment of patients convalescing in hospitals or homes, and for purchase of toys, books, etc. Transportation of patients to clinics and hospitals for regular checkup.

National Organization for Public Health Nursing.—Cooperation which public health nursing services need from other groups is in inverse ratio to the supply of nursing personnel available, and is really limited only by the imagination of the executives involved, and the time they can give to arranging details of the cooperative effort.

National Safety Council.—Basic principle of successful national campaign for accident reduction is the enlistment of the support of varied interests and organizations.

National Society for the Prevention of Blindness.—Interest for the creation and development of sight conservation services at both the state and local level. Consultant services are offered to develop this interest. Further development and wider use of vision testing services; extension of sight saving classes in schools; protection of workers in industry through correction of physical defects.

National Tuberculosis Association.—January, 1948 marks the opening of the National Tuberculosis Association campaign that will have as its theme "Get a Chest X-ray." This is being sponsored by The Advertising Council, Inc., for the National Tuberculosis Association and its affiliates as a nationwide, continuing educational campaign to drive home to the American people the necessity of early diagnosis of tuberculosis. The rapidly growing practice of mass X-ray services in communities should be of interest to all community agencies and all such agencies could, it seems, aid the tuberculosis associations and the health departments in furthering such services. All local community agencies can, of course, be of particular help when a community-wide X-ray survey is done in a city or community.

HOUSING PLANS AND CONSTRUCTION

By Jack H. Bryan

Director of Information, Housing and Home Finance Agency

NEW HOUSING CONSTRUCTION

From the standpoint of the number of new permanent dwellings built, 1947 was the best year since the all-time high reached in 1925. This high rate of activity was reflected on the financial side as the volume of new home mortgages reached another post-depression peak and the total non-farm home-mortgage debt probably reached $30,000,000,000 for the first time in home-financing history. On the legislative side, too, the year produced several important pieces of Congressional action highlighted by approval of the President's Reorganization Plan for the permanent government housing agencies into a single coordinated unit.

More new houses were started in 1947 than in any year in the past two decades. Preliminary estimates indicate that approximately 860,000 new permanent dwelling units were put under construction during 1947, compared to 671,000 new permanent units in the previous year. The all-time high for home construction in the United States was established in 1925 when 937,000 new dwellings were reported. Home building during the last half of 1947 was at an annual rate about equal to this record pace.

PROGRESS IN RENTAL HOUSING

A primary objective of the 1947 housing program was the provision of rental housing, and considerable progress was made in this direction. By the end of November, applications for rental housing projects, providing over 160,000 new dwelling units for the Second World War veterans and their families, had been received by the Federal Housing Administration. All these projects were to be built and operated by private interests with funds advanced by private lending institutions. The loans will be insured by the FHA under the Veterans Emergency Housing provisions in Title VI of the National Housing Act. The problem of providing sufficient rental units, however, is still a serious one, since by far the majority of all new accommodations provided during 1947 were single-family houses which are usually built for sale rather than for rental purposes.

Despite the good record of new construction, housing remained one of the most serious domestic problems. The need for additional accommodations was still being measured in terms of millions of units. High prices were as prevalent in the housing picture as in other segments of the nation's economy, and both material and labor costs in construction work rose significantly during most of the year. This was offset to some extent by a more steady flow of building materials which permitted more efficient operations and a shorter period of construction.

RELAXATION IN EMERGENCY HOUSING POWERS

Emergency housing powers exercised during 1946 by the combined Office of the Housing Expediter and the National Housing Agency were gradually relaxed during the first part of the year as materials production improved. Virtually all of these powers, except veterans' preference for new homes and restrictions on amusement and recreation construction, were repealed by Congress in the Rent Act in June 1947. Modified rent controls under this act were assigned to the Office of the Housing Expediter.

HOUSING LEGISLATION

Significant legislative enactments during the year included the approval of the President's Reorganization Plan No. 3, which established the Housing and Home Finance Agency as a permanent unit of the Gevernment, combining the principal agencies in this field. An additional sum of $35,000,000 was appropriated to complete the program of re-using existing temporary structures originally built for war workers to provide housing for veterans, especially at the colleges and universities where they were in training under the G.I. Bill of Rights.

MORTGAGE AND LOAN INSURANCE

The authority of the Federal Housing Administration to insure residential mortgages was extended. Insurance under Title I, for remodeling and repairs, of the National Housing Act may now be written until July 1, 1949. Title VI insurance was extended to March 31, 1948, and the limit of insurance which could be approved under this section was raised to $4,200,000,000. However, this ceiling was reached in November, and legislative steps were taken early in the special session of Congress to raise the limit of Title VI loans which could be insured by the FHA.

ESTABLISHMENT OF THE HOUSING AND HOME FINANCE AGENCY

The Housing and Home Finance Agency was established on July 27, 1947 under Reorganization Plan No. 3 of 1947, submitted by the President and approved by the Senate. The reorganization plan groups the principal permanent housing functions of the Government in a single agency. With the establishment of the HHFA, the wartime National Housing Agency was abolished.

The HHFA covers remaining war housing responsibilities and housing functions that, before the war, were scattered among 13 agencies in seven departments and independent establishments of the Government. It includes the Office of the Administrator and the following constituent operating agencies: the Home Loan Bank Board, the Federal Housing Administration, and the Public Housing Administration. The FHA and the PHA each have a Commissioner as the administrative head of the organization, while the Home Loan Bank Board is composed of a bi-partisan terms of years. All are appointed by the President and confirmed by the Senate.

In addition, the Plan establishes the National Housing Council on which the Administrator, the constituent agencies and other government departments with direct housing functions are represented. The Council includes the Administrator of the HHFA, who serves as its chairman, the Commissioners of the FHA and the PHA, the chairman of the HLBB, the Secretary of Agriculture, the chairman of the Board of Reconstruction Finance Corporation, and the Administrator of Veterans' Affairs or designees of the latter three.

The National Housing Council brings into consultation the major agencies of the Government having a direct part in housing that are not constituents. Its task will be that of coordination of housing policy among all the agencies and with general economic and fiscal policy of the Government. It will provide a special avenue of liaison with private industry and private interest groups and a means of directing the attention of all housing agencies jointly to the solution of common problems, such for instance as adequate statistical methods and common approaches to [illegible] problems.

The Administrator of the Housing and Home Finance Agency is responsible for the general supervision and coordination of the functions of the three constituent units making up the new agency. In addition, the Administrator has by separate acts of Congress a responsibility of great moment in the housing situation [illegible] and [illegible] of [illegible] throughout the country. The permanent and temporary war and emergency units of housing [illegible] under the Lanham Act [illegible] [illegible] of which [illegible] are temporary. The [illegible] that was formerly assigned to the Federal Public Housing Authority [illegible] the responsibility for policy and supervision is in the Administrator.

How to manage and dispose of this housing in the best public interest is an extremely difficult task. The disposition policies, announced early in September, provide for disposal, with the primary emphasis on encouraging home-ownership and to give preference [illegible] to veterans. [illegible] with communities and [illegible] on a [illegible] basis. Within the framework of these policies, the Agency is seeking to carry out the expressed general intent of Congress in the disposition program in a [illegible] manner.

In summary, the Housing and Home Finance Agency is designed through full use of government housing resources to aid private industry to provide decent housing [illegible] for all income groups of the American population, and to bring together [illegible] and parts of the [illegible] housing industry, and government at all levels, in [illegible] effective programs for the problem areas of housing.

HOME LOAN BANK BOARD

The Home Loan Bank Board is composed of a bi-partisan group of three members and supervises the Federal Home Loan Bank System and the Federal Savings and Loan Insurance Corporation. The permanent agencies [illegible] to encourage thrift, promote home financing and to protect savings. The HLBB also directs the liquidating operations of the Home Owners' Loan Corporation, an emergency agency [illegible] to aid distressed home owners during the depression.

FEDERAL HOME LOAN BANK SYSTEM

Authorized in 1932 [illegible] the System provides a [illegible] home mortgage credit reserve for [illegible] savings and loan associations and other home-financing institutions.

[illegible] regional Federal Home Loan Banks are serving member home-financing institutions [illegible] both short and long-term advances to meet their [illegible]

Through the regional banks, funds may be shifted from areas of abundant credit to areas of scarcity. Since the establishment of the banks, they have advanced $[illegible] to member institutions, with advances of about $[illegible] outstanding as of June 30, 1947.

Member institutions of the System, June 30, 1947, numbered 3,[illegible]. Of these 3,[illegible] were savings and loan associations, insurance companies, and cooperative banks, including 1,4[illegible] Federal Savings and Loan Associations for which membership is mandatory, 25 savings banks, and 19 insurance companies. Assets of all member institutions amounted to approximately $[illegible] on June 30, 1947.

FEDERAL SAVINGS AND LOAN INSURANCE CORPORATION

Congress provided in 1934 for insuring accounts of investors in savings and loan associations and similar home financing institutions by creating the Federal Savings and Loan Insurance Corporation. Federal savings and loan associations were required to be insured. Insurance is optional for State-chartered associations. The public confidence inspired by the fact that investments are so safeguarded has produced a steady flow of funds into insured savings institutions. More than 5,000,000 investors in 2,[illegible] savings and loan associations with combined assets of over $[illegible] are now protected by insurance up to $5,000 each.

HOME OWNERS' LOAN CORPORATION

Over a period of three years beginning in June 1933, the Home Owners' Loan Corporation refinanced the mortgages of more than 1,000,000 homes, providing low-interest, long-term loans which gave distressed home owners a new chance to retain their properties. In these rescue operations approximately $3,500,000,000 was loaned to home owners, including the cost of repairs to properties and other disbursements of the Corporation.

More than 80 per cent of this investment has been liquidated through collections on the Corporation's loans and the sale of properties acquired by foreclosure, which it was obliged to undertake in [illegible] cases. [illegible] Although the HOLC [illegible] June 30, 1947, [illegible] Approximately [illegible] borrowers have paid off their mortgages in full ahead of maturity. [illegible] When liquidation is completed, the Corporation will be able to return to the United States Treasury all of its capital plus a moderate return.

FEDERAL HOUSING ADMINISTRATION

The Federal Housing Administration was established June 1934, by the National Housing Act "to encourage improvement in housing standards and conditions, to create a sound mortgage market and to provide a system of mutual mortgage insurance," a part of the program to help revive the construction industry and the home financing market. The FHA does not itself make loans but insures private lending institutions against loss on residential and property improvement loans meeting FHA standards.

The FHA revolutionized methods and procedures of home financing. In place of the short-term first, second and third mortgages with their high interest rates and renewal fees, it popularized the single, long-term amortized mortgage bearing a low interest rate. The maximum interest rate allowed on mortgages insured under Section 203, Title II, is 4½ per cent, while 4 per cent is the maximum under Section 207 of Title II and all of Title VI. Interest is computed on declining balances, as is the FHA insurance charge of ½ of 1 per cent. The premium is deposited in the appropriate insurance fund.

FHA operations have substantially improved the general quality of dwelling construction and of subdivision layouts. It set up nationwide building, location, and subdivision standards. To be eligible for FHA mortgage insurance, a home must meet such requirements as accessibility to employment centers, to transportation, schools, and shopping districts. As a result, residential neighborhoods have been established on a firmer basis.

Peacetime functions of the FHA are carried out under Titles I and II of the National Housing Act. Title VI was added as a war measure in March 1941, to help provide private housing temporarily meeting emergency war and post-war housing needs, but designed and built for permanence.

Title I provides for government insurance to lending institutions on loans for property improvement alterations and repairs. Most of these loans are limited to a maximum amount of $2,500 and a maximum term of three years, and are repaid through monthly installments. However, as part of the war and post-war emergency program, Congress authorized the FHA to increase from $2,500 to $5,000 the size of individual loans under this title, and with longer maturities, where operations would provide additional living accommodations for war workers, and now for veterans, through conversion of existing structures in areas specifically designated by the President.

Title II provides for insurance of mortgage loans ranging up to $16,000 on one-to-four family houses made by approved private lending institutions, and for monthly amortization of the loan over periods as long as 20 years. Such loans may cover either new or existing housing, but generally may not exceed 80 per cent of the property valuation. Where loans are for not more than $5,400, however, and cover new single-family, owner-occupied homes built under FHA inspection, the mortgage may be made for 90 per cent of the appraised value and may have an amortization period as long as 25 years. On new owner-occupied homes, valued at not more than $10,000, mortgages may cover 90 per cent of the first $6,000 of valuation and 80 per cent of the remainder up to a maximum mortgage of $8,600, with a maximum term of 20 years. Under Title II, the FHA also provides mortgage insurance for large-scale rental projects.

Title VI was added to the National Housing Act by Congress (March 1941) specifically to assist in providing housing for war workers. Insurance activity under the original title ended in September 1945. Most of FHA's operations during the war period were conducted under the new title. Mortgages insured under it were limited to a maximum of $5,400 on a single-family house; $7,500 on a two-family house; $9,500 on a three-family house; and $12,000 on a four-family house, and could cover up to 90 per cent of FHA valuation. Occupancy priority of these dwellings was reserved for eligible in-migrant war workers. Large scale rental housing projects for war workers were also insured under Title VI. Approximately 450,000 dwelling units for war workers were provided by mortgages insured under this Title, for which the total insurance authorization provided by Congress was $1,800,000,000.

Title VI was revived (May 1946) by the Veterans' Emergency Housing Act with substantially the same provisions and an additional authorization of $2,000,000,000. Instead of war workers, occupancy of the new housing financed under Title VI is limited to veterans and hardship cases. The former mortgage limitation of $5,400 on a single-family house may be raised as high as $8,100 by the FHA Commissioner in areas where construction costs have risen, on a two-family house from $7,500 to $12,500, on three-family properties from $9,500 to $15,750, and on a four-family from $12,000 to $18,000. The mortgages may be for up to 90 per cent of the FHA's estimate of the "necessary current cost" within these limitations. Large-scale housing mortgages also may be for up to 90 per cent of the "necessary current cost" with a maximum of $5,000,000 or $1,500 per room attributable to dwelling use (may be raised by the Commissioner to $1,800 in higher cost areas).

The Title VI authorization was further increased in June 1947 by $2,000,000,000, with an additional $200,000,000 on approval of the President, bringing the total possible under this Title to $4,200,000,000. Section 609 was added to provide insured loans to prefabricated housing manufacturing and Section 610 to provide insurance of mortgages executed in connection with the sale of government-owned permanent homes and housing projects meeting FHA requirements.

From its establishment in June 1934 through June 1947, FHA has insured under Titles I, II and VI a grand total of $10,346,879,706—all loans made by private financial institutions—and has assisted approximately 8,480,000 American families in obtaining better housing. This grand total includes 6,691,000 properties of all types (mostly single-family houses) repaired or improved with $2,720,996,000 of short-term loans insured under Title I; 1,330,000 dwellings (mostly single-family homes) built or bought with $5,655,952,000, of long-term mortgages insured under the normal provisions of Title II; and 459,000 dwelling units built or bought with $1,969,930,000 of mortgages insured under the war or veterans' emergency provisions of Title VI.

A large amount of these loans has been repaid; mostly with regular monthly installments—approximately $2,198,000,000 of Title I loans, $2,675,781,000 of Title II loans, and $539,318,000 of Title VI loans.

FHA's credit experience under its mortgage insurance program has been outstanding. Out of 1,330,000 small dwelling units financed with mortgages insured under Title II, only 4,067 properties have been foreclosed and turned over to FHA as of June 30, 1947. All have been resold. Since 1940 the FHA's income from its insurance premiums and investments has been sufficient to meet all operating expenses and to add substantial amounts to insurance reserves.

In addition to being self-supporting, the FHA has been able to declare several dividends under the participation provisions of the Mutual Mortgage Insurance Fund on certain groups of mortgages insured under Section 203 of Title II. Further dividends will be declared for other groups as they are justified by the accumulated equity balance.

PUBLIC HOUSING ADMINISTRATION

The Public Housing Administration was established on July 27, 1947 under the terms of the President's Reorganization Plan No. 3. It has the responsibilities and functions previously administered by the Federal Public Housing Authority. Its major activity is the low-rent and slum clearance program transferred from the United States Housing Authority. The agency administers the program of loans and annual contributions which enable local communities to provide decent housing at rents that low-income families can afford to pay. It also is responsible, under policies established by the HHFA Administrator, for the management of most public war housing and for the disposal of this housing as it becomes surplus to the needs of reconversion and demobilization.

In 1947, the PHA had four principal assignments. (a) Completing, under policies of the HHFA Administrator, a program of providing temporary housing for veterans by relocating and converting surplus war housing and military structures for re-use as veterans' temporary dwellings. (b) The management of public war housing during the period of reconversions and demobilization for distressed families of veterans and servicemen, for civilian employees of the War and Navy Departments and of private industries completing war contracts, and for distressed families dislocated or displaced as a result of the war or demobilization. (c) Carrying out the disposition of federally owned housing determined to be surplus to the above needs. (d) The administration of low-rent housing constructed under the U. S. Housing Act of 1937, the Emergency Relief Act, and the National Industrial Recovery Act.

The program of providing temporary emergency housing for veterans by relocating and converting surplus temporary structures is authorized by Title V of the Lanham Act, as amended by the Mead resolutions (December 1945 and March 1946). These resolutions authorized appropriations of $445,627,000 to pay the Federal cost of the re-use program and authorized the National Housing Agency (wartime predecessor of the Housing and Home Finance Agency) to transfer surplus facilities to educational institutions and communities able to convert them to veterans' housing at local expense. Additional appropriations of $35,500,000 were made in 1947 to complete the program.

A total of about 260,000 accommodations for veterans will be provided by this program, 181,000 of them at Federal expense. More than half of this housing is located at educational institutions for use by student veterans. By mid-1947, more than 85 per cent of the total program had been completed.

In addition to veterans accommodated by the relocation of surplus facilities, almost 300,000 veterans' and servicemen's families were living in public housing remaining at its wartime location at the end of June 1947. Such families accounted for about 50 per cent of all occupied war and low-rent housing units in programs administered by the PHA.

Before the outbreak of war interrupted construction of low-rent housing under terms of the U. S. Housing Act, local housing authorities in some 170 communities built 334 projects containing 105,600 units for low-income families formerly living in slum dwellings. Such housing has been predominantly urban, but a small number of farm housing units were constructed under a rural program started shortly before the war.

The total development cost of the pre-war low-rent projects was $483,000,000. Although the PHA is authorized to lend up to 90 per cent of the development costs, it has actually supplied only two-thirds of the long-term financing, as a result of the ability of local housing authorities to sell bonds on the private market at an interest saving. All loans from the PHA or private investors are being repaid in full, with interest, in accordance with established amortization plans.

To help keep rents within the means of low-income families, the PHA makes an annual contribution, or subsidy, which for the fiscal year 1947 totaled $5,612,387 or $4.56 per dwelling unit per month. Federal subsidy payments totaled $56,071,599 to June 30, 1947. This represents the entire cost to the Federal Government since the beginning of the low-rent program. In addition, the local community is required to make an annual contribution equivalent to at least one-fifth of the Federal contribution. This local contribution is made normally by exempting the projects from state and local taxes, as authorized by the United States Housing Act and state housing laws. The total housing built or authorized under the U. S. Housing Act as of June 30, 1947 comprised 216,779 dwelling units in 801 projects. Construction of 159 of these projects, comprising 21,210 dwelling units, was deferred during the war and they have not yet been put under construction.

During the period of demobilization and reconversion, the PHA has responsibility for the management of publicly owned war housing constructed during the war to house immigrant war workers and their families. War housing remaining under active management, either directly by the PHA, by local housing authorities, or by other agencies, includes about 391,000 family dwelling units, 17,971 dormitory units, and 13,000 units of stop-gap housing such as trailers and portable shelters.

When public war housing becomes surplus to the needs of veterans and demobilization, the PHA has responsibility for disposing of it in accordance with the policies laid down by the HHFA Administrator. As of June 30, 1947, some 441,000 units of such housing remained to be disposed of. These include about 231,000 temporary units, unsuitable for long-term use as housing. These must be removed by July 25, 1949, except where the Administrator of the Housing and Home Finance Agency, in consultation with the local communities, determines there is a longer need in connection with orderly demobilization; about 165,000 permanent units, some of which are of demountable construction and can be dismantled and re-erected at new locations, which will be sold to veterans, occupants and other private purchasers unless sold or transferred to other Federal agencies or state and local governments; about 37,700 family and dormitory units converted from existing structures during the war to house war workers, mostly under seven-year leases, and will be returned to private owners at the expiration of the lease term or sooner if the owners purchase the unexpired lease term; about 7,800 units of permanent housing constructed by the Defense Homes Corporation in the early defense period, these being sold to private purchasers.

The Public Housing Administration also plans to dispose of some 2,200 permanent units in three Greenbelt towns—Greenbelt, Md., near Washington, D. C.: Greenhills near Cincinnati, O.: and Greendale near Milwaukee, Wis. These projects were started during the depression by the Resettlement Administration as examples of planned suburban communities for moderate-income workers employed in nearby cities. They were transferred to the Farm Security Administration, and later, in 1942, to the predecessor of PHA, the Federal Public Housing Authority, for management and eventual disposal.

PRISONS AND CRIME CONTROL

By Benedict S. Alper
Division of Social Activities, United Nations

TRENDS IN PRISON POPULATION

At the end of 1946 there were 141,404 prisoners present in state and Federal prisons and adult reformatories. This figure represents an increase of 6,552 during the year, or about 5 per cent of the 134,852 prisoners in confinement at the end of 1945.

In view of the fact that 1946 was the first full post-war year, a comparison of 1946 with the war period is of significance. During the war years, the prison population decreased from an estimated 182,641 at the beginning of 1944, remained relatively constant during 1945, and then, for the first time, showed an appreciable increase in 1946. The decrease between 1940 and 1944, of course, reflects the induction into the armed forces of millions of males in the age groups which contribute most heavily to the prison population. During the latter part of 1945 and 1946, these men were returned again to civilian life, with a consequent rise in prison commitments.

It is likely, as well, that industrial displacement due to conversion back to production for civilian use, the shift in population which was the reverse of the mass movement into war industry beginning in 1940, plus the expected rise in the rate of criminal activity which has marked previous post-war periods, all contributed to the impetus given once more to the prison commitment rate.

New York, among other states, reported a slight downward dip in total prison population, but noted at the same time a rise in the figures for the upper teen ages, and a significant percentage increase among the reformatory age group of girls. Juvenile delinquency cases received by Children's Courts in New York State decreased 8 per cent in 1946, compared with 1945, but remained approximately 16 per cent higher than in 1938.

The number of juvenile offenders in Federal custody reached a higher point in the spring of 1946 than at any time since the inauguration of the Federal juvenile offenders program in 1938.

All jurisdictions, Federal, state, and local, reported a mounting per capita cost in their correctional systems, paralleling the general abrupt price rise with the abolition of price control. At the same time, the 48 hour, and even 40 hour week, became standard in more state institutions, reflecting gains which had long been prevalent in the industrial world. Higher salaries were needed to attract and hold personnel in a period marked by high employment; related fields like probation and teaching experienced similar difficulties in holding on to their good people.

THE "ALCATRAZ REVOLT"

The violence which marked the war period was not without its effect on prison populations. The most serious escape attempt in the history of the Federal Bureau of Prisons occurred at Alcatraz in May 1946, resulting in the death of two officers, three prisoners, and the injury of many. The revolt, engineered by six of the most desperate of the institution's intractable inmates, was frustrated at the outset by the failure to obtain the keys leading to the outside yard. The mass escape attempt and the ensuing gun battle ended in the surrender of the revolting prisoners after nearly two days of serious rioting. Indicative of the basic philosophy of the Federal Prison system, the Director reported that this tragic incident would not be permitted "to impair or handicap programs designed to rehabilitate the more hopeful offenders."

CORRECTIONAL PROGRAMS OF THE U. S. ARMY

On Dec. 31, 1946, the Army's total population of general court-martial prisoners, which reached a peak of almost 35,000 in October 1945, had dropped to less than 16,000. Of this number, some 11,000 were in disciplinary barracks and guard houses, less than 1,000 were still overseas, and almost 4,000 were in the custody of Federal penal and correctional institutions.

When the rehabilitation centers operated during the war were inactivated in May 1946, a total of 42,373 general military prisoners had been restored to active duty, about 50 per cent of all those committed. Only about 12 per cent are reported to have since committed further offenses and become military prisoners again.

The War Department's five-man Advisory Board on Clemency, established in June 1945 under civilian leadership, had reviewed over 27,000 cases during 1946 and recommended 84 per cent for some degree of clemency. In July 1946, the War Department established an Advisory Board of Parole under a civilian chairman and proceeded to modernize completely its release system, utilizing Federal probation officers for the first time for the supervision of Army parolees.

As the year drew to a close, the Army's correctional program was aimed at preparing general prisoners for return to civilian life, by means of vocational training and other programs of rehabilitation.

CORRECTIONAL PROGRAMS OF THE U. S. NAVY

The maximum number of men in confinement under the Corrective Services Division of the Navy exceeded 16,000, compared with a peacetime high of 200. Special emphasis was placed on restoration to duty through the exercise of clemency by the Secretary of the Navy. As a direct result of this correctional and rehabilitative program, approximately 75 per cent of all Navy general court martial prisoners confined during and immediately after hostilities were restored to active duty.

The end of 1946 saw the number of Navy prisoners still in confinement at one-quarter of the wartime peak. Of the number restored, more than two-thirds are reported to have satisfactorily completed probationary periods of six to 12 months and to have earned the right either to be restored to active duty or to be honorably discharged.

The wartime peak of 20 places of confinement for Naval court-martial prisoners was reduced to four, including a disciplinary barracks and a retraining command on each coast. Major offenders are transferred to the Federal Bureau of Prisons for the period of their confinement.

The Navy has developed in-service training for administrative and correctional officers, and civilian experts at key points help to guide the program. The increase in the number of offenders committed for civil (criminal) offenses from 5 per cent to 20 per cent reduces the percentage available for restoration to active duty and increases the percentage discharged to civilian life, thus causing Naval authorities to develop a broad program of shop and vocational training, closely integrated with the industrial works program.

A survey of a random group of 1,200 men restored to duty in March 1946, reports that three-quarters successfully completed their term of probation. This has encouraged the continuance into the first post-war year of the correctional program, developed during the war, of rehabilitation in order to return men to duty.

SURVEYS OF WARTIME RECORDS OF MEN IN THE ARMED SERVICES

During the year, surveys made in New Jersey and Illinois into the wartime records made by men with prior civilian criminal records, who had been inducted into the armed forces under a liberalized program which saw more than 80,000 (estimated) of such entrants, established that their behavior varied little from the general run of draftees. Army regulations, since 1878, had previously forbidden the induction of men with prior felony records. Of those accepted into the armed services under the new liberalized regulations, the percentage of those who won decorations, promotions, and good conduct awards, as well as the percentage of them who were court-martialled during their military careers, closely paralleled that of soldiers without previous criminal records. This finding has yet to be confirmed by a careful follow-up of a sample large enough to corroborate or deny these tentative conclusions. If confirmed, this fact would go far to disprove the necessity for incarcerating large numbers of serious law violators in large costly penitentiaries. Progressive penologists have long felt that the degree of security employed for all prisoners is too often determined by the highest common denominator required for the safe-keeping of the small number of hardened and desperate offenders. It is to be hoped that such a follow-up study will be of value to the armed forces and important as an item of general public interest as well.

THE COUNTY JAIL

The Federal inspection service of local jails, to determine their suitability for the housing of Federal prisoners awaiting trial, transfer, etc., had fully approved only 14 per cent and conditionally approved for emergency use only 11 per cent of the 3,127 county and city jails inspected since 1930. In Virginia, 97 per cent of local jails were rated unfit for detention of Federal prisoners, in Vermont 93 per cent, Michigan 85 per cent, Illinois 75 per cent, and Ohio 69 per cent. Only 30 per cent of all jails visited appeared to have improved, while 47 per cent seemed to have become worse. "Most local jails," reports the Federal Bureau of

Prisons, "continue to constitute a disgrace to our democracy."

PAROLE

The National Probation Association took an important step forward with the broadening of its interest to include parole as an additional field of activity. Parole has won increasing recognition as an instrument for helping the released prisoner to adjust again in the community, thus successfully discrediting the attacks, which reached their peak a decade ago, which were made whenever an ex-prisoner was arrested while on parole. It is not yet sufficiently well realized that 97 per cent of all sentenced prisoners are ultimately released: parole assures a continuing interest in the offender in his difficult days again in the community. The name of the organization is now officially changed to The National Probation and Parole Association.

CAR STEALING AND OTHER DEVELOPMENTS

Car stealing will not be so easy in 1948 as it was in 1947, with the passage in several cities of municipal ordinances making it illegal to leave ignition keys in automobiles parked on the streets or in unattended lots. Inconvenience is the penalty; the policeman noticing the keys takes them to the nearest station house where they may be called for by the owner. One year after such an ordinance was passed in St. Paul, Minn., the car theft rate decreased 65 per cent.

The Bureau of Prisons in Puerto Rico set a precedent for other progressive penal administrators when it instituted a procedure permitting "week-ends at home" for certain prisoners. To be selected for this furlough, a man must first have served a year of his sentence and must be a first offender with a good record. Particular preference is given to men, married or single, whose family ties are strong. The only condition exacted is that the prisoner must give his word of honor to return. It is reported that, of those released to date, all without exception had returned to the institution when their time was up.

The antique State Prison at Charlestown, Mass., long condemned as unhealthy and unsafe, was doomed by a law passed by the state legislature, which authorized the prison to be razed, and appropriated funds to start the building of a new institution.

The Department of Corrections in Missouri was established under the provisions of the new Constitution, resulting in the reorganization of the state's peno-correctional facilities into three divisions—Penal Institutions, Educational Institutions (for juvenile offenders), Probation and Parole. The act also provides for release on parole of any prisoner in a state correctional institution, except persons under sentence of death. With the abolition of the fee system for sheriffs, it is to be expected that the jails of this state will make progress during the period immediately ahead

New Jersey legislation established a centrally located state study center for children. This center, to provide complete diagnostic service to any governmental agency, "prior to the disposition of any case before it," had operated in 1946 as a branch of the State Hospital at Marlboro. This year saw its transfer to Allaire, in the former home of Arthur Brisbane, whose name is incorporated in the title of the institution.

Pennsylvania legislation now requires the establishment of a reception center of the type of Elmira, N. Y. (Judges in New York State no longer commit youths 16 to 21 years of age to a specific institution, but to Elmira, where they are studied and classified, and from which they are transferred to an appropriate institution for treatment.) Staffed with medical, psychiatric, educational and vocational personnel, in addition to the usual custodial officers, the Pennsylvania center will receive all young persons who are committed by the courts to any penal or reformatory institution in the state. The center will be located at what is now the State Industrial School at White Hill, near Harrisburg.

The American Prison Association distributed in 1947, a *Manual of Suggested Standards for a State Correctional System,* a publication long awaited, which was circulated to state legislators and others who have an interest in improving their correctional systems. The recognition of prison problems as of equal importance to that of other branches of state administration, is likewise recognized by the Penal Study Committee of the Ohio Post-War Program Commission, which rendered its final report early in the year. The report recommends not only the construction of new institutions and the modernization of old, but stresses also the value of probation and parole, and urges the recruiting of professional personnel, purely on a merit basis.

No state correctional system has made greater advances during the year than that of California, under progressive legislation passed in recent years, combining a Youth Authority and an Adult Authority in a Department of Correction under qualified professional administrators.

THE JUVENILE OFFENDER

In the field of public education into the causes of crime and for an understanding of effective ways of prevention and treatment, the New York Society for the Prevention of Crime rendered an outstanding service with its weekly broadcast, "I was a Convict," carried over a major network. This program, which received an award from Ohio State University for its educational value, focused attention away from the sordid and melodramatic aspects of the problem, though utilizing drama to focus attention on the causation of early delinquent behavior and the results of the neglect of such early manifestations on the development of adult criminal careers.

Georgia passed a law enabling boards of education in cities and towns of over 300,000 population to establish detention and instruction schools for mentally defective, delinquent, and dependent children. Massachusetts, Michigan, Mississippi and New Jersey, created legislative commissions to investigate child delinquency.

Mississippi established youth (juvenile) courts as divisions of the county or chancery court in each county, with jurisdiction over delinquent and neglected children. The judge of the youth court is also empowered to appoint youth counselors (the equivalent of probation officers) under the state merit system to investigate and supervise the cases of children under the jurisdiction of the court.

The trend toward higher age jurisdiction of the juvenile court was continued by New Jersey, with the raising from 16 to 18 years of the upper age limit of juvenile delinquency. All motor vehicle violations involving persons under 18, must now go before the juvenile court.

The first State Youth Commission, established in New York in 1945, to give financial aid to local communities on a matched funds basis for the creation of local youth bureaus, and to give assistance to localities in the establishment of recreation and related programs for young people, has led other states to pass legislation patterned after the New York law.

The reports of the National Conference on Prevention and Control of Juvenile Delinquency held in Washington last year, were published during 1947. State and local conferences, on the same subject, inspired by and patterned after the National Conference, were convened in several states. A continuing Committee of the National Conference functioned throughout the year for the stimulation of nationwide activity in the crime prevention field. The conviction grows that delinquency among juveniles is largely a product of local negligence or inadequacy and that it is at the local level that action must be taken to correct the development of criminal careers.

DIVISION XVI

LABOR AND LABOR LEGISLATION

LABOR CONDITIONS AND LEGISLATION

By Witt Bowden
Bureau of Labor Statistics, Department of Labor

GENERAL

During the first half of 1947, labor unions were largely concerned with efforts to prevent the enactment of restrictive labor legislation; during the second half of the year, a major union interest was the interpretation, testing, and ultimate repeal of the Federal Labor Management Relations Act and of restrictive state laws. Not all of the 1947 labor laws were viewed by labor as unfavorable; state workmen's compensation acts and related measures in particular were materially strengthened and liberalized as to benefits. Industrial relations acts, however, were bitterly opposed by unions because of such provisions as those requiring new qualifications for rights of representation, bargaining, and prosecution of unfair practices; restricting the right to strike; forbidding or limiting union security (especially the closed shop); prohibiting various forms of political activity; and permitting damage suits and injunctions in labor disputes.

Economic conditions were favorable for collective bargaining; rising prices and the strong demand for labor enabled unions, especially before the new Federal act became operative on Aug. 22, to renew or extend their agreements on relatively favorable terms with few important work stoppages. At the same time, rising prices outran the advance in wages and caused grave concern for the maintenance of living standards. Employment remained stable at unprecedentedly high peacetime levels, but labor leaders repeatedly charged that adequate employment and production were menaced by what they viewed as excessive prices and profits and the ultimate dissipation of market demand for goods and services by the inflationary loss of mass purchasing power. Unions intensified their organizing activities, especially in the South, and made small gains in membership. The major change in affiliations was the withdrawal of the United Mine Workers from the American Federation of Labor. Restrictive labor legislation at home and critical conditions abroad intensified the interest of union circles in political and international problems beyond the traditional fields of trade-union policy.

TAFT-HARTLEY LABOR ACT

The event of outstanding interest in the labor world in 1947 was the passage of the Labor Management Relations Act, commonly known as the Taft-Hartley Act. Finally passed over the President's veto on June 23, the act was noteworthy for the prolonged and bitter controversies occasioned by it, the radical changes it made in the legal status of unions, and the extension of public authority in the field of labor-management relations. The significance of the law can be evaluated only in a tentative manner pending full administrative reorganization, interpretation by administrative agencies and the courts, and the crystallizing of union and employer attitudes and policies. Noted herein are only the more important provisions of the exceptionally elaborate act.

AMENDMENT OF NATIONAL LABOR RELATIONS ACT

The New NLRB.—The National Labor Relations Board was enlarged from three to five members. The Board members were deprived of certain administrative and research functions usually performed by similar agencies such as the Federal Trade Commission. A General Counsel, nominated by the President, was given final authority for investigating and prosecuting all unfair labor practice cases and authority over the Board's field personnel.

Redefinition of Unfair Labor Practices.—The act redefined unfair labor practices by employers. Thus, the Board can not consider an alleged anti-union statement as unfair unless it involves a threat or an offer of gain; and complaints must be filed within six months, with a copy served on the employer. Practices by employers are defined as unfair if they limit the rights of non-union employees. In this connection, the closed shop is prohibited, except in cases of agreements previously made. The union shop (permitting the hiring of non-union workers but requiring them to join the union) is authorized only if the union has bargaining rights and if a majority of all eligible workers so vote. No union security agreement is authorized if forbidden by state law. A voluntary checkoff of union dues is permitted, for one year, if authorized in writing by the individual workers. These and related restrictions on unions, such as the exercise of restraint or coercion to influence workers, and the provision that workers may deal individually with employers in regard to complaints, were designed in part to strengthen the position of employees who may prefer, in employer terminology, to maintain their "right to work," or in union terminology, to obtain a "free ride" without sharing union responsibilities.

Various labor practices by unions were defined as unfair. These include restraint, coercion, or discrimination against non-union employees (involving questions, for example, of picketing); refusal to bargain collectively; requiring fees viewed by the NLRB as excessive; requiring payment for services not rendered; and engaging in certain jurisdictional and sympathy strikes and boycotts.

New Restrictions on the Right to Strike.—The definition of the term "strike" is enlarged to include a "concerted slow-down or other concerted interruption of operations by employees." In addition to limitations on jurisdictional and sympathy strikes, the general right to strike is restricted by "cooling-off" provisions. A 60-day notice of termination of an agreement is required. Employees who strike during that period lose their status and rights under the act unless rehired. Within 30 days after the original notice has been served, the party desiring termination of the agreement must notify the appropriate Federal and state mediation agency if no agreement has been reached. Participation in strikes by Federal employees is prohibited. Additional restrictions on the right to strike are discussed later in connection with "national emergencies."

New Union Qualifications and Board Procedures.—New qualifications are required of unions for obtaining recognition and collective bargaining rights and the right to petition against unfair practices. A union, in order to obtain legal status with the NLRB, must annually supply its members and the Government with detailed financial, organizational, and operating data. Every official of a local, national, or international union must file annually the so-called non-Communist affidavit. Prohibitions or limitations are imposed on the representation and collective bargaining rights of supervisors, professional employees, and plant guards. An employer may petition for an election at any time after a union has claimed a majority and demanded recognition. The new law simplifies the procedures by which dissenting groups of employees and groups not affiliated with national or international unions may obtain representation for bargaining and a hearing in unfair labor practice cases.

The act radically changes the procedures for prevention of unfair labor practices. A union is bound by the acts of its agents as defined by the courts. Unions are subject to court action for failure to observe the Board's "cease and desist" orders. The Board may apply for injunctions in cases of unlawful boycotts and jurisdictional strikes and in emergency cases pending its decision. Employers may sue for damages, and, notably in cases of violation of "no-strike" contracts, may apply for injunctions.

CREATION OF FEDERAL MEDIATION AND CONCILIATION SERVICE

The Labor Management Relations Act discontinued the Conciliation Service in the Department of Labor and set up an independent Federal Mediation and Conciliation Service, operating nationally except in the field of transportation, still subject to the National Mediation Board. The new agency was directed to limit its work to disputes which it might view as threatening a "substantial" (not a "minor") interruption of commerce. It is also directed to offer its services in grievance disputes, as distinguished from the making or renewal of agreements, "only as a last resort and in exceptional cases."

The new agency obtains information regarding disputes by the requirement that it must be notified 30 days before the termination of agreements. The Board may intervene on its own initiative as well as upon request by a party to the dispute. If conciliation fails, the Service may go so far as to submit to the employees the employer's last offer, for a secret-ballot vote.

Supplementing the work of the new agency is a labor-management panel, appointed by the President. Its 12 members, serving in an advisory capacity, represent labor and management in equal numbers.

HANDLING OF "NATIONAL EMERGENCIES"

In cases of work stoppages on a national scale affecting such vital commodities or services as coal, railroad transportation, and essential utilities, there was general recognition of the need for special preventive measures. The new act defined such a situation as a "national emergency" in the sense of an actual or threatened work stoppage "affecting an entire industry or a substantial part thereof engaged in trade, commerce, transportation, transmission, or communication" or "engaged in the production of goods for commerce," which would "imperil the national health or safety."

An elaborate procedure was prescribed. The President was authorized to appoint a special board of inquiry and upon receiving the board's report to direct the Attorney General to petition for an injunction without regard to the Norris-La Guardia Anti-Injunction Act. The board of inquiry would make a further report to the President within 60 days after the issue of an injunction, and the parties in the meantime would be required to confer with the mediation officials. Within 15 days after the report by the board of inquiry, the NLRB would take a vote of employees on acceptance of the employer's final offer. Within the next five days, the injunction would be vacated, and, in case of no settlement, the President would report to Congress.

SUPPLEMENTARY PROVISIONS OF LABOR MANAGEMENT RELATIONS ACT

Two additional provisions of the Labor Management Relations Act have special significance. One of these is designed to curb political activities. The act prohibits either expenditures or contributions by unions or corporations in connection with Federal elections, primaries, caucuses, or conventions. Officials who consent to such actions are subject to fine or a year's imprisonment or both. This provision has a special bearing on efforts to secure the repeal or amendment of the act by influencing the election of members of Congress. Another provision set up a joint Congressional committee for the continuing study of various phases of labor-management relations. A major function is the study of Federal labor law administration.

UNION REACTIONS TO NEW FEDERAL POLICY

The opposition of unions to the Labor Management Relations Bill proving ineffective, the unions undertook in the first instance, between the enactment of the bill in June and its effective date on Aug. 22, to conclude collective agreements which would at least defer the application of important provisions of the act. Large numbers of contracts were negotiated for two or more years. Closed-shop or union-shop provisions were included in a majority of the new contracts. Many unions, including the United Mine Workers, succeeded in eliminating no-strike clauses from their agreements and limiting their liabilities under the damage-suit clauses of the act.

Employers were generally disposed to proceed cautiously in asserting their rights under the law; the high levels of profits, production, and demand for workers gave unions certain bargaining advantages which tended to defer a real test of the act. Caution on the part of employers was also actuated by uncertainties as to the interpretation and administration of the act.

Many unions declared their intent to challenge the constitutionality of vital provisions of the act and to seek its early repeal, but caution characterized the acts of unions as well as employers. An outstanding instance of refusal to conform to the law as commonly understood was the decision of the International Typographical Union (AFL) not to sign agreements with employers. For the purpose of maintaining the prevailing closed-shop arrangements, the union proposed to post the terms under which its members would work. The union, as a result, was charged by the NLRB with an unfair labor practice, namely, a refusal to bargain collectively. Certain local damage suits were also brought against the union. A major premise in the action of the union was the unconstitutionality of the act.

Another area in which unions generally challenged the constitutionality of the act as commonly understood was in the field of political activity. The unions declared it to be their intention to defeat Congressional proponents of the act. To that end, union journals publicized their opposition to those who voted for the bill; union officials took an active part in elections to fill vacancies; and the AFL, the CIO, the railroad brotherhoods, and various individual unions undertook to obtain extensive contributions and organize educational and political activities for the avowed purpose of electing men who would favor the repeal of the act.

One of the most perplexing of the early problems confronted by the unions was the signing of the non-Communist affidavit, a prerequisite for maintaining legal status with the NLRB. This was particularly important for unions whose collective-bargaining rights were challenged either by employers or by other groups of workers. It was necessary, also, if a union was to obtain a Board hearing on a charge of unfair labor practices. Union officials were unanimous in the view that the affidavit requirement is discriminatory and unconstitutional, but practical considerations led to the extensive signing of the affidavit. The president of the United Mine Workers, who was also a member of the AFL Executive Council, refused to sign, and his action barred the 1,390 local trade and Federal unions directly chartered by the Federation from qualifying under the act. A fight in the November convention led to a constitutional amendment which deprived the members of the Executive Council of the title of officer. Noteworthy among major unions whose officials refused to sign the affidavit were the United Mine Workers and the United Steelworkers, both presumably strong enough to maintain their status without resort to the NLRB. The Chairman of the Board stated in December that compliance by major unions was proceeding so rapidly that failure to comply will hardly pose many further problems for the Board.

STATE LAWS AFFECTING LABOR

The focal point of interest in the field of labor legislation was the Federal Labor Management Relations Act. That measure, however, had the interstate commerce limitations of Federal authority; and it had been preceded by a number of somewhat similar state restrictions on unions. The Federal act recognized state legislation by declaring that no union security agreement is authorized if in violation of a state law, and by providing that the NLRB might empower state agencies to take jurisdiction over certain cases "even though such cases may involve labor disputes affecting commerce," unless the state laws are inconsistent with the Federal law. The act also directed the Federal Mediation and Conciliation Service to give priority to state or other conciliation services when available in disputes having only a minor effect on interstate commerce.

STATE ACTION IN INDUSTRIAL RELATIONS

Among the 44 states holding regular legislative sessions in 1947, action of some nature was taken by 30 states in the field of industrial relations. Not all of these measures included restrictive or prohibitory policies, but most of them reflected a desire to limit the freedom of action of labor organizations. New laws or amendments in 14 states prohibited or limited closed-shop, union-shop, or union-security arrangements, but regulations of this nature were adopted only in states with relatively small industrial employment; six of the states are in the South. Picketing or other strike activities were subjected to new regulations in 12 states, but only in Michigan and Pennsylvania among the major industrial states. Pennsylvania, California, and nine other states prohibited secondary boycotts. Attempts were made to restrict jurisdictional disputes in six states. Special provisions for handling disputes in public utilities were adopted in 11 states. Public employees in six states were denied the right to strike; these were the comparatively large states of Michigan, Missouri, New York, Ohio, Pennsylvania, and Texas. In three states (Delaware, New Hampshire, and North Dakota), unions were required to register and make financial reports.

WORKMEN'S COMPENSATION AND OTHER STATE MEASURES

Outside of the field of labor-management relations, probably the most important state legislation of 1947 concerns workmen's compensation. Laws in that field were passed by 39 states. Outstanding progress was made, particularly in the increasing of disability benefits and benefits to survivors. Increases recognizing in some degree the advances in wages and cost of living were granted in 22 states. Occupational-disease laws were enacted for the first time in six states, bringing the total to 39 states. The coverage of persons and employments was increased in four states, with compulsory instead of elective provisions in two additional states. Five states increased the amount or duration of medical aid.

In the field of child labor, a noteworthy change in Connecticut establishes standards for child labor in agriculture. That state also passed a comprehensive anti-discrimination law. In two states, equal-pay laws were enacted on behalf of women. Several states made changes in their regulations relating to industrial health and safety.

NATIONAL LABOR RELATIONS BOARD

It was widely recognized that the new labor relations acts, both Federal and state, would require a long period of administrative and judicial interpretation, especially in view of the raising of basic questions of constitutionality. The adjustment of administrative jurisdictions will also require much time, as in the relations between the Board members and the General Counsel of the NLRB and between Federal and state agencies. The functioning of the reorganized Board and of the new Federal Mediation and Conciliation Service proceeded gradually because of the new and complex nature of their authority and the lull in crucial labor disputes.

An instance of administrative problems under the law was the handling of affidavits of non-Communist affiliation. The Board's General Counsel ruled that officials of parent bodies, such as the AFL and the CIO, must sign the affidavit before any affiliated union could acquire legal status before the Board. On Oct. 7, the Board overruled the General Counsel and held that failure of these top officials to sign would disqualify only the local unions that are affiliated directly with the general organization (such as the AFL Federal unions) and not with an intermediate national or international union. The ruling applied only in representation cases, but the General Counsel accepted it also in unfair labor practice cases.

Various rulings by the Board, or its General Counsel, progressively narrowed the legal status, before the Board, of unions not qualifying under the registration and affidavit provisions of the law. A noteworthy instance was a decision that petitions for Board elections for representation made before Aug. 22 could not be recognized for noncomplying unions. Another decision declared that a noncomplying union which had won a representation election but had not actually been certified before Aug. 22 as representing its members for collective bargaining would be denied certification. Another significant ruling, on Dec. 2, barred noncomplying unions from Board elections for representation even though an employer files a petition in support of the union's claim.

During the first three months of the operation of the law (to Nov. 22), more than 2,500 cases were filed, the number increasing rapidly after the middle of October. About 60 per cent of the cases were petitions for elections to choose a bargaining representative or to authorize a union-shop. In union-shop elections held by Nov. 22, more than 90 per cent of eligible voters cast their ballots and more than 90 per cent of those voting favored union security. About 200 charges of unfair labor practices were filed against unions by employers or individuals. Some of the new provisions regarding injunctions in labor disputes for unfair practices by unions were tentatively used but not finally tested; the injunction procedure for national emergencies was not invoked.

DEPARTMENT OF LABOR

One of the limited functions of the Department of Labor in administering the Labor Management Relations Act, the handling of union registration data, was assigned to the Union Registration Branch of the Division of Labor Standards. Registration forms, made available on Aug. 6, were extensively but not universally filed by unions. To the Bureau of Labor Statistics of the Department of Labor was assigned the functions of maintaining a file of collective agreements and related data and of supplying nonconfidential data and factual information to aid in the settlement of labor disputes, functions which had normally been exercised by that agency.

MEDIATION AND CONCILIATION SERVICE

The work of the Federal Mediation and Conciliation Service developed gradually, partly because of the lull in labor disputes and partly because of the need to develop cooperative arrangements with non-Federal agencies. At a conference with state agencies late in November, the Director of the Federal agency deplored the occasional conflicts in jurisdiction and stated that regional directors of his agency had been given authority to make arrangements for determining jurisdiction in local areas.

COURT ACTIONS ON NEW LAWS DEFERRED

The far-reaching nature of state and Federal labor legislation in 1947 requires a thoroughgoing change in judicial as well as administrative actions affecting labor. Earlier decisions are vitally affected, and much time must elapse for the judicial interpretation of the new laws. Actions by the courts in 1947 were few and largely tentative and preliminary.

THE SUPREME COURT AND THE UNITED MINE WORKERS

An outstanding Supreme Court case was that of the United Mine Workers, March 6, 1947, preceding the enactment of the new Federal law. The United Mine Workers Union and its president had been cited for contempt on Nov. 21, 1946 by the Federal District Court of the District of Columbia, for refusal to obey a temporary restraining order to prevent the union from ending its 1946 agreement with the Government. The defendants, on Dec. 4, were adjudged guilty and fined, and the restraining order was made a preliminary injunction.

On March 6, 1947, the Supreme Court, by a split decision, upheld the contempt citation, and ruled: (1) that the Norris-LaGuardia and Clayton acts, in limiting the Federal courts in the issuing of injunctions in labor disputes, are not applicable to a dispute between the Federal Government and its employees; (2) that under the existing union agreement, the coal-mine employees were government employees; and (3) that, in any event, the Federal District Court had authority to issue a restraining order to preserve existing conditions while it was considering its authority to issue an injunction, and that failure to obey the restraining order was punishable as criminal contempt. The Court stated, however, that the fine imposed was excessive.

The decision was described by the AFL Executive Council as "the outstanding labor case of the twentieth century" and as "one of the most ignominious decisions ever announced." Criticism was based largely on the view that the decision meant a reversion to "government by injunction."

PORTAL-TO-PORTAL PAY: COURT ACTION AND A NEW LAW

The Supreme Court, in the Mt. Clemens Pottery case (the "portal-to-portal" case), June 1946, had interpreted the Fair Labor Standards Act in a manner that recognized many of the claims of workers to pay for travel time or for "preliminary" or "postliminary" time spent other than at the machine or usual place of work. Previously, travel time in mines had been defined by the court as working time and therefore compensable. About 1,900 suits on file in May 1947 had been brought by unions and individuals for "portal-to-portal" pay, including back pay, and some employers expressed alarm as to their liabilities.

The Portal-to-Portal Act of May 14, 1947 redefined and limited the liability of employers under the Fair Labor Standards Act and also under the Walsh-Healey and Davis-Bacon Acts. It provided for the dismissal or compromise settlement of portal-to-portal suits brought before May 14, 1947. The new law also established a two-year limitation for the filing of all wage claims after May 14, and in some instances limited claims covering the period before that date to two years or less. New guides were prescribed for the administration of the three acts, especially the Fair Labor Standards Act. Particularly important guides were (1) the exemption of employers from liability for payment for "preliminary" or "postliminary" activities unless compensable under contract, custom or practice, and (2) the granting to employers of a "good faith" defense.

The Portal-to-Portal Act so vitally affected the work of the Wage and Hour Division of the Department of Labor that it became necessary to replace earlier interpretations. On Nov. 18, 1947, the Administrator issued an interpretative bulletin containing a general statement as to the effect of the new law on the Fair Labor Standards Act. The bulletin was issued as "a practical guide to employers and employees," but it was pointed out that the correctness of an administrative interpretation can finally be determined only by the courts.

LABOR-MANAGEMENT DISPUTES

Decline in Work Stoppages.—Work stoppages had been restricted during the war for the most part to unauthorized or "wildcat" strikes. The flood of post-war stoppages, beginning in September 1945, continued through May 1946, reaching its peak in February, when idleness of workers directly involved in strikes totaled 22,900,000 man-days, or 4.2 per cent of estimated working time. By June 1946, idleness had fallen to 0.75 per cent of working time.

During the 12 months from November 1946 to October 1947, the number of work stoppages beginning in the month ranged from 168 in December to 480 in April; the number of workers directly involved in stoppages beginning in the month ranged from 630,000 in April to 60,000 in October; and man-days idle in stoppages in effect during the month ranged from 1.2 per cent of total working time in April to 0.2 per cent in October and also in January to March. From 1935 to 1939, man-days idle averaged 0.3 per cent of total working time. Thus, in 1947 strike activity was substantially comparable in its average effect on man-days of idleness to the prewar situation.

Causes of the Decline in Strikes.—The high tide of early post-war work stoppages resulted from the unusual tensions of wartime and post-war readjustments. These included the effects of industrial, occupational, and regional shifts in employment; reductions in real weekly earnings; conflicts attending the resumption of normal collective bargaining when wage and price controls were being relaxed; and the uncertainties of the reconversion period. The decline in strike activity late in 1946 and in 1947 may have been influenced by the preoccupation of unions with state and Federal labor legislation but it was primarily a result of the easing of post-war tensions and the substantial progress in collective bargaining.

Major Strikes.—There were few important work stoppages during 1947. A strike of exceptional nature was that of teachers in Buffalo, N. Y., from Feb. 24 to March 3, ended by assurances of increased salaries for 1947-48. A telephone strike beginning April 7 continued for more than a month. Wage increases were granted, but union demands for nationwide or industry-wide bargaining were denied. Workers in bituminous-coal mines refused to return to the mines after a vacation period until agreement was reached, early in July, on the terms of a new contract. Late in June. walkouts began in many of the east-coast stripyards, notably the Bethlehem Company's yards. At the peak, about 75,000 workers were involved. Final settlements were not made until Nov. 10. The strike was particularly noteworthy because it occurred in one of the few industries which experienced slack post-war employment, entailing a relatively weak bargaining position for workers.

EXTENT OF "PACKAGE PATTERN" WAGE AGREEMENTS

The slight extent of work stoppages in 1947 is an indication of the success of workers and employers in the peaceful renewal or extension of collective agreements. An agreement on March 22 between the United Rubber Workers and the "Big Four" rubber companies averted a major strike threat by an increase of 11.5 cents in basic wages. This basic-wage "pattern," with certain "fringe" adjustments, was soon adopted in various other factory industries, including electrical goods, steel, automobiles, and farm implements. Thus, the agreement of April 20 between the United Steelworkers and the United States Steel Corporation embodied the "package pattern" of approximately 15 cents, a basic wage increase of 12.5 cents per hour, supplemented by additional vacation pay, reduction or removal of regional and plant inequalities, and a new severance pay plan.

Agreements in most of the manufacturing industries provided for increases somewhat smaller than the 15-cent "package pattern"; the rise in factory hourly earnings between March (when the rubber workers obtained their increase) and October was about 8 cents per hour. The fact of major significance, however, was the settlement of disputes in most industries by peaceful collective bargaining.

Wage gains in most of the trade and service industries were comparatively small. In retail trade, for example, the advance in hourly earnings between March and October, although larger than in most of these industries, was only 5.5 cents. The highly organized railroad workers obtained an increase of 15.5 cents, with the exception of some relatively small groups whose negotiations were still pending at the end of the year. The largest increase of the year was obtained in the almost completely organized bituminous-coal industry in the agreements of early July.

BITUMINOUS-COAL AGREEMENTS

Coal-mine workers obtained in July a phenomenal advance of 44.5 cents per hour in straight-time earnings, the same pay for eight hours underground as previously received for nine hours and in addition a "wage pattern" increase of 15 cents per hour. The 5-cent payment per ton to the miners' welfare fund was raised to 10 cents. Safety provisions and other gains in the 1946 contract were continued. A clause was inserted for the purpose of relieving the union of damage-suit liability for unauthorized walkouts.

The miners' gain in basic rates was offset in part by the surrender of premium pay, except for work on Saturday as the sixth consecutive day, that is, for work after 40 hours per week; under the previous 9-hour day, premium pay had been received for work beyond 7 hours per day or 35 hours per week. The rise in gross hourly earnings was therefore much smaller than the rise in rates. The exceptional rise in rates was explained on the basis of the reduction of premium pay, the long-deferred reduction in hours, the manpower problems of the industry, the specialized skills (now in strong demand but surplus at low levels of production), the special hazards and the arduous nature of the work, and the large increases in productivity. The average increase in wage cost was approximately 50 cents per ton.

DEFERRED TEST OF NEW LABOR POLICY

After Aug. 22, the effective date of the Labor Management Relations Act, collective bargaining was conducted under a new set of conditions. However, there was a rush of bargaining before the deadline, and most of the agreements in effect at the end of the year had preceded the effective date of the act. In addition, the need for clarification of the law and its administration contributed to a cautious attitude by employers in the invoking of those provisions of the law which are viewed as favorable to employers. Unions, furthermore, enjoyed a relatively favorable bargaining position because of the tight labor market and rising prices. The success of collective bargaining in 1947 is, therefore, not to be viewed as a test of the effects of the new law.

GROWTH OF UNIONS

Labor organizations operated in 1947 under certain special difficulties. One of these was the prevalence of attitudes unfavorable to unions in connection with the movement for state and Federal regulatory measures. Another obstacle in the way of union organizing activities was the legislation prescribing various restrictive conditions for the maintenance of membership, the obtaining of collective bargaining rights, and the defense of unions against unfair practices. At the same time, certain conditions tended to stimulate the growth of unions. These included the unifying effects of a common defense, the brisk demand for labor, progress of the labor press and radio, and gains in wages and working conditions commonly associated with unions.

Some unions, notably those most prominent in war industries, had suffered temporary losses in membership during the reconversion period. Most of these losses had been recovered by the fall of 1946; the estimated aggregate membership of 14,975,000 was then, in fact, somewhat larger than the previous peak of 14,800,000 in 1945. Estimates from union sources for the fall of 1947 ranged from about 15,500,000 to somewhat more than 16,000,000. The AFL retained its lead even after the withdrawal of the 600,000 members of the United Mine Workers. The addition of these to the independent or unaffiliated unions gave to those groups the largest advance in membership. The main progress in organizing activity resulted from the membership drives of the AFL and the CIO in the South.

LABOR UNITY CONVENTIONS

The sixty-sixth annual AFL convention met in San Francisco, Oct. 6-17, and the ninth CIO convention met in Boston, Oct. 13-17. A renewed sense of common interest was aroused by opposition to the new labor legislation and by anxiety regarding the pressure of rising prices on standards of living. United action, however, was prevented by differences as to the appropriate method. The CIO advocated an approach to unification through immediate joint action in fields of urgent common interest; the AFL continued to insist on organic unity as a condition of concerted action.

PLANS FOR POLITICAL ACTION

In the field of political action, the AFL modified its previous policy by creating a new agency, Labor's Educational and Political League, but reaffirmed, as the aim of the new agency, the traditional policy of rewarding labor's "friends" and defeating its "enemies" without regard to party lines. The impelling motive of intensified political action was the view that the new labor law is "designed to make it impossible for unions to live and function effectively"; it substitutes "government domination" and "distrust, suspicion, and class hatred" for "sound labor-management relations."

The AFL program included (1) tests of the constitutional validity of the law and particularly its more questionable sections; (2) the repeal of the act as the AFL primary objective; (3) the defeat of members of Congress who voted for the bill; (4) the setting aside of the national election day as a holiday to give workers a better opportunity for voting; and (5) the omission of all no-strike provisions from collective bargaining contracts as a protection against damage suits and other litigation. To carry out this program and to meet other Federation needs, the per capita dues of members of affiliated unions were increased, and the executive council was authorized, in case of need, to levy an assessment of one cent per member per week for "not exceeding 26 consecutive weeks" instead of "not exceeding 10 weeks."

The CIO convention characterized the new labor law as "infamous" and a "legal monstrosity." A convention resolution asserted that the CIO "can not and will not acquiesce in a law which makes it a crime to exercise rights of freedom of speech, freedom of press, freedom of assembly"—a reference to the criminal penalty against certain political activities. An "unceasing campaign" was demanded for the repeal of the act and for the "political repudiation" of those responsible for its passage. The convention pledged renewed support of the CIO Political Action Committee. It emphasized the program of stimulating registration of voters and "getting out the vote," and expressed the hope of working cooperatively with the AFL and the railroad brotherhoods "on the local, community, state, or national level."

WAGES, PRICES, AND ECONOMIC PROBLEMS

Both conventions gave attention to rising prices and challenged the view that wages and wage demands had been responsible. Exorbitant or extortionate profits were denounced as the main inflationary factor. A renewal of price controls was demanded by the CIO convention. The question of future wage demands was left to the constituent unions.

Labor legislation, although a major issue, did not prevent action by the two conventions on a variety of economic and social problems other than wages and prices. These included tax relief for low-income groups, new minimum-wage legislation, health insurance, a better housing program, control of monopolies, and a more effective implementation of the Employment Act of 1946.

INTERNATIONAL PROBLEMS

The European recovery program was endorsed by both conventions. Opposition had been expected in the CIO convention, but that body adopted a strong general resolution described by CIO President Philip Murray as approval of the Marshall Plan, and Secretary of State Marshall, addressing the convention, received an enthusiastic reception.

The AFL convention reasserted its hostility to the World Federation of Trade Unions on the ground of Communist domination and reaffirmed its policy of fighting Communists and fellow travelers "who would use the free trade-union movement as a vehicle to destroy it." The convention approved the efforts of the Federation to maintain contacts with unions abroad and to strengthen the free trade-union movement.

The CIO convention unanimously adopted a resolution which, by implication, asserted the complete freedom of the CIO from the anti-American influences associated by the AFL with the WFTU. "The CIO," the resolution stated, "is an American institution with a single national allegiance and that allegiance to our own country, the United States of America, its form of government and basic democratic institutions under the Constitution of the United States." CIO President Murray reported to the convention that the CIO had continued its efforts to strengthen the WFTU and to advance within that organization "the American tradition of democracy and freedom and for the extension of these ideas to all the peoples of the world."

The CIO convention reiterated its criticism of the barring of the CIO from representation in the International Labor Organization. The AFL convention heard reports of the Federation's participation in the ILO annual conference at Geneva, in the work of its Governing Body, and in the meetings of most of its industry committees. Both conventions strongly approved continued participation in the work of the Economic and Social Council of the United Nations. The widened international outlook of labor was reflected in the program and resolutions of the 14th Annual Conference on Labor Legislation, which met in Washington on Dec. 9. The Conference emphasized international labor standards, particularly in relation to state legislation in the United States.

ELECTIONS AND UNION AFFILIATIONS

The convention elections resulted in two important changes. At the CIO convention, R. J. Thomas, a vice president of the CIO, of the United Auto Workers, and of the World Federation of Trade Unions, was replaced as one of the CIO vice presidents by O. A. Knight of the Oil Workers Union. The United Auto Workers' convention also replaced Thomas and other opponents of President Walter Reuther in that union, thus unifying one of the largest unions in support of the Reuther policies, a move commonly viewed as strengthening the anti-Communist elements. In the AFL convention, the failure of John L. Lewis of the United Mine Workers to carry his opposition to signing the non-Communist affidavit, led to his refusal of membership in the executive council and the election in his place of Daniel W. Tracy of the International Brotherhood of Electrical Workers. Later, Lewis sent to the AFL a curt note "disaffiliating" the United Mine Workers from the Federation.

CHANGES IN WAGES AND PRICES

In 1946 and early 1947, the "first round" of post-war wage increases ran its course; in 1947, the "second round," overlapping the first, netted smaller but substantial gains. The second-round "package pattern" of about 15 cents (including "fringe" adjustments in addition to basic rates) was formulated early in the year and was adopted in many industries, but the average gain fell considerably short of 15 cents.

The earlier post-war wage increases were associated mainly with reductions in hours and premium pay; the later increases, more largely with rising prices, production, and profits. The recent movements of wages and prices may be compared most significantly in the perspective of the earlier post-war period. Comparisons of basic data in the form of percentage changes are given in the accompanying tabulation for the entire post-war period, for June 1945 to June 1946 (preceding the sudden upturn in prices in July), and for the period from June 1946 to September 1947.

CAUSES OF THE RISE IN PRICES

Price changes were associated closely with wage changes in a few industries, but price increases in gen-

COMPARATIVE CHANGES IN WAGES AND PRICES, JUNE 1945 TO SEPTEMBER 1947

	Per Cent of Increase		
	June 1945 to Sept. 1947	June 1945 to June 1946[1]	June 1946 to Sept. 1947[2]
Average earnings of non-agricultural wage earners[3]			
Hourly	25.4	9.3	14.8
Weekly	16.8	1.8	14.8
Consumers' prices			
All items	27.0	3.3	22.9
Food	44.2	3.2	39.8
Wholesale prices			
All commodities	48.4	6.4	39.4
Farm products	42.9	7.4	33.0
All commodities except farm products	49.8	6.0	41.3

[1] Preceding the temporary lapse and later removal of controls.

[3] The percentage changes are computed from indexes constructed by the Federal Reserve Bank of New York on the basis of Bureau of Labor Statistics data and other sources.

eral, especially after the spring of 1946 (accompanying and following the decontrol measures), far exceeded the rise in the cost of labor, even assuming no rise in productivity. In the absence of price controls and rationing, the increase in aggregate wages available for the buying of goods and services was one of the sources of pressure of the means of payment on available supplies and therefore on prices. In so far, however, as increased wage payments resulted from larger employment and production, and in so far as the economy achieved increased productivity, the pressure of wages as buying power on available supplies was counteracted.

While wage payments were expanding the means of payment in an economy of limited supplies, the increases in other types of income were also exerting pressure on prices. Between the third quarter of 1945 and the third quarter of 1947, the total compensation of hired workers (including salaried employees) rose 6 per cent, as compared with an increase of 29 per cent in other types of income. The corresponding increases from the third quarter of 1946 to the third quarter of 1947 were 9 per cent for workers' compensation and 21 per cent for other income. Between July 3, 1946, and Nov. 26, 1947, the loans of weekly reporting members of the Federal Reserve System rose 34 per cent. The increase in bank loans in the year ended in September 1947 was the largest in history for comparable periods. Rising investment implied a sharp competition of business men for capital goods and a restricted use of production facilities for making consumer goods.

Pressure of demand on available supplies was also increased by an extremely short corn crop in the face of abnormal demands for grain. Shortage of livestock feed in turn tended to raise the prices of meat, poultry, and dairy products, portending a cumulative shortage of these products in 1948. The abnormal and urgent needs of other countries, especially for grains, aggravated the problem of rising prices.

THE PROBLEM OF CONTROLLING INFLATION

Various factors were involved in the rapid rise of prices. The problem of checking inflation, therefore, gave rise to a variety of proposals. The Council of Economic Advisers, created by the Employment Act of 1946, repeatedly pointed out the danger of rising prices and suggested the possible need for the reinstatement of limited controls. The President, in his message of Nov. 17 to the special session of Congress, advocated a program of selective controls extending to credit and to domestic consumption and exports as well as prices and wages.

In the fields of wages and prices, the President recommended legislation to deal directly with specific prices in "limited areas of acute danger." Authority was requested to impose price ceilings on vital commodities in short supply that basically affect the cost of living or industrial production. The Rent Control Act, it was stated, should be extended and strengthened. Authority was also requested to ration basic cost-of-living items "on a highly selective basis." Finally, as a corollary of price controls, the President recommended a grant of authority to deny wage increases such as would prevent the maintenance of price ceilings. Strong Congressional opposition, together with the limited time available during the extra session, prevented the authorization of new compulsory controls, even on a "stand-by" basis.

INDICATIONS OF RISING PRODUCTIVITY

Both the opponents and the proponents of compulsory controls agreed that vital measures for combating inflation included efforts to maintain full employment with rising efficiency and expanding production.

Recent trends of productivity in terms of man-hour output are not readily measurable. Available information indicates, however, a continuation of the steady upward movement that has long characterized the American economy. Productivity had been retarded in the reconversion period by the necessary readjustments of plant, equipment, materials, and manpower, and by the problems of resuming normal collective bargaining. Conditions after the middle of 1946 were much more favorable to productivity. Heavy investments since the war had taken advantage of improved technology in the replacement of worn or obsolescent equipment. The shorter work week, peaceful collective bargaining and adjustment of grievances, apprenticeship and other training methods, and improved safety measures (notably in coal mining), contributed vitally to more efficient production. Both management and labor exhibited increasing skill and adaptability to the more stable conditions of peacetime production.

Labor unions gave tangible expression to their desire for increased productivity as a basis of higher wages and standards of living. The reduction in the shift of coal miners from nine to eight hours was followed by evidences of a significant rise in man-hour output. An illustration of union attitudes, as expressed in collective bargaining, is the agreement of March 22, 1947, between the Rubber Workers and the "Big Four" companies: "The union agrees to cooperate with management to attain the best productivity possible which is consistent with fair and reasonable labor practices. The union will support management's efforts to improve production, establish efficient methods, eliminate waste, conserve materials and supplies, and improve the quality of workmanship."

GAINS IN PRODUCTION AND EMPLOYMENT

Throughout 1947, the nation's economy operated not far below its capacity except under "forced-draft" conditions and extreme overtime such as existed during the war. Substantial gains in 1947 production were nevertheless achieved.

The Federal Reserve Board's index of industrial production (manufactures and minerals) was 9 per cent higher in 1947 than in 1946. Freight carloadings rose 8 per cent, and electric energy production, 14 per cent. The value of construction contracts in October 1947 was 27 per cent greater than in October 1946, an increase resulting in part from rising costs.

Unemployment in the entire civilian labor force in November was 1,621,000, the lowest figure since August 1945. Total civilian employment rose from 57,040,000 in November 1946 to 58,595,000 in November 1947, figures seasonally below the peak of 60,079,000 in July. The number of wage and salary workers in non-agricultural establishments rose from 42,065,000 in October 1946 to 43,298,000 in October 1947. Increases occurred in all major industry divisions except government. The decline in public employment was wholly Federal; the number of employees of state and local governments increased.

GENERAL INTEREST IN MAINTAINING FULL EMPLOYMENT

There had been widely expressed fears of a 1947 recession in employment and production. Persistence of the danger was recognized; and interest in the problem of the continued maintenance of high levels characterized the thinking alike of labor, management, academic, and government circles.

The large volume of exports contributed to business activity, but under conditions of scarcity in domestic markets the abnormal foreign demands complicated the problem of achieving a balanced economy at high levels. The President's Committee on Foreign Aid (composed of business men, economists, and labor leaders) recommended a broad program consonant with the Marshall Plan. The Committee at the same time emphasized the necessary American sacrifices and the accentuated need for measures to counteract the forces tending toward inflation and an unbalanced economy.

Various private groups gave special attention to the problems of full employment. Among these were the Committee for Economic Development, primarily representative of business, and the National Planning Association, with committees of leaders of business, agriculture, and labor.

VIEWS OF LABOR ON FULL EMPLOYMENT

Labor leaders recognized that full employment implies the efficient use of adequate capital resources as well as labor. CIO President Murray, in his annual report to the convention, stated that "the limited capacity of our industrial production machinery" as well as "the lack of purchasing power in the hands of the masses of our people" is a threat to "continued full employment." Leaders of both the AFL and the CIO insisted on the need for price and income adjustments as necessary to prevent the cutting away of consumer buying, to halt the forces which, unchecked, will cause depression, and to provide a continuing basis, as distinguished from existing temporary props, for the maintenance of full employment.

WORK OF THE COUNCIL OF ECONOMIC ADVISERS

Probably the most distinctive current feature of the national economy in contrast to former periods of boom and depression is the conscious program centering around the Employment Act of 1946, a program designed, in the works of the December 1947 Report of the Council of Economic Advisers, to keep the "complicated machinery of production, distribution, and consumption going steadily and efficiently." The Council described the program as a challenge to Government, industry, agriculture, and labor—a challenge which "will be the supreme test of our business system." The Council indicated that its work in the immediate future would be directed toward giving aid, under the Employment Act, to public agencies and private groups in the working out of tangible measures for meeting the challenge.

The Council, an entirely new type of official agency, warned that before the end of 1948, or at least "in the not distant future," the country must face the issue of preventing a breakdown in market demand under full production. It was asserted that we can not long continue to depend on recent "artificial props" for the maintenance of "maximum employment and high production."

The Council's Report was in essence a discussion of the nature and means of achieving a "pattern of reciprocally balanced consumption and production" viewed as necessary for the maintenance of maximum employment beyond the period of wartime and transitional "artificial props." Essential steps include the maintenance of "the lowest price consistent with a fair return in a stable economy rather than the highest price that the traffic will bear in an unstable economy." The Council recognized the necessity for adequate capital and set forth certain standards for judging the adequacy of income required for capital formation. The avoidance of unused and deflationary accumulations was emphasized; the current rate of capital formation must be adjusted "to the rate of consumption that will keep capital plant utilized at the highest practicable capacity with the highest practicable steadiness." Means must be devised for "the passing on of more goods to more people." This entails "a double process of enlarging mass incomes and lowering prices of mass-produced goods," with "much higher consumption in all the lower and middle ranks."

LIVING STANDARDS: A NEW FAMILY BUDGET

An exceptionally significant statistical development of the year was the publication of new family budget data for city workers. The contents of a budget for a family of four were described in detail, and its cost was estimated in terms of prices in 34 cities in March 1946 and June 1947. The study had been undertaken at the request, in the spring of 1945, of the Labor and Federal Security Subcommittee of the House Committee on Appropriations.

The budget, as described by the Commissioner of Labor Statistics, is not a subsistence or minimum budget, "but it is far from a luxury budget. It does not represent an ideal budget or one based on a few people's notions of what workers should have; rather it is based on the kinds of goods and services workers' families in the United States actually select." In determining the level of living, the Bureau in general followed the recommendations of a technical advisory committee of experts. In respect to food, for example, the recommendations of the Food and Nutrition Board of the National Research Council were adopted as to the amount of calories, proteins, and other food elements necessary for health and well-being; the Bureau then selected families whose food consumption approximately met this standard and listed the kinds and quantities of foods actually bought by them.

The details of the items and quantities in the budget apply to a family of four—an employed father with three dependents, his wife, a girl of 8, and a boy of 13, with both children in school. This basic budget was priced in 34 cities. The highest cost in June 1947 was $3,458 in Washington, D. C., and the lowest cost was $3,004 in New Orleans, La. Next below the Washington cost was $3,388 in Seattle, Wash., and next above the New Orleans cost was $3,010 in Kansas City, Mo.

Various adjustments were made to apply the basic budget for a four-person family to other types of families. The average wage of the individual factory worker in June 1947 was $49.33 per week, or, at an annual rate, somewhat less than $2,600. The Bureau of Labor Statistics, however, in publishing the data, emphasized the fact that the estimates of cost can not be related with exactness to available figures of average earnings of families or individuals.

EMPLOYMENT AND UNEMPLOYMENT STATISTICS

By Irma Rittenhouse
New York State Division Placement and Unemployment Insurance

GENERAL

Employment in 1947 continued at high levels, and the recession expected by those fearful of the effects of price inflation in the latter half of the year did not occur. Expansion of peacetime production and employment showed signs, however, of a halt; hiring rates slowed down as labor requirements were finally met in industries producing for the peacetime boom market. Some slight declines in employment in scattered industries developed in the second half of the year, but none was pronounced enough to forecast clearly any general lowering of the record employment level.

The Federal Reserve (unadjusted) index of industrial production rose from 184 in September 1946 (1935-39 = 100) to 189 in September 1947. Durable and non-durable goods production both showed slight increases over this period. The U. S. Department of Commerce reports that, while heavy goods industries are still trying to meet a backlog of unfilled orders, output has been somewhat reduced in other lines; certain consumers' goods encountered a leveling off of demand, and automobiles, refrigerators, and railroad equipment, although still in demand, have been hampered in production by shortages or irregular supplies of some materials.

In September 1947, the civilian labor force was estimated at 60,784,000 (U. S. Bureau of the Census). Of those at work or seeking work, 17,233,000 were women, a somewhat smaller proportion than a year earlier. About 50,000,000 persons were in the non-agricultural labor force. Occupational shifts of both men and women workers were of major proportions in both 1946 and 1947, and two years after the war there was still evidence of rather widespread efforts by workers to resettle occupationally.

The U. S. Bureau of Labor Statistics reported in the late fall a generally satisfactory quantitative distribution of labor with no major industry hampered in production by shortages of manpower. Exceptions were low-wage and other relatively undesirable jobs, as well as the customary demands for workers of specified skills, not necessarily immediately available in the locality. Some geographical differences in labor supply developed toward the end of the year, with the North Central manufacturing region still seeking labor and the Northeast and Southeast reporting surpluses of labor leading to relatively high rates of unemployment.

In the second month of 1946, manufacturing employment increased, especially in durable goods industries. By April, manufacturing employment dropped in the first clearcut recurrence of normal seasonal trends since the end of the war. By June, total employment (including part-time) exceeded 60,000,000. At this time began the small scattered declines in employment and in hours of work above referred to, attributable apparently to slackening of consumer demand and to more efficient use of labor. A definite slackening of demand for labor generally in the manufacture of non-durable goods was evident by the middle of the year. By autumn, the recurrence of seasonal employment fluctuations (almost eliminated during the war and immediate post-war production drives) was fully evident. The number of jobs remained at a high level until the end of the year, however, and in October, with a labor force 7,000,000 larger than in 1945, persons with no job attachment were at the lowest point (1,700,000) since the war ended. Table I shows the status of the labor force, as estimated by the U. S. Bureau of the Census, in September of 1947 and 1946.

TABLE I

LABOR FORCE, SEPTEMBER 1947 AND SEPTEMBER 1946

(in thousands)

	September 1947	September 1946
Armed forces	1,326	2,220
Civilian labor force	60,784	59,120
Female	17,233	17,270
Male	43,551	41,850
Employed	58,872	57,050
Female	16,714	16,780
Male	42,158	40,270
Non-agricultural employment	50,145	48,300
Agricultural employment	8,727	8,750
Unemployed	1,912	2,070

Estimates of total employment by industrial grouping are now available, in addition to indexes (U. S. Department of Labor). These illustrate the points of growth and shrinkage in recent employment, and figures for September of 1946 and 1947 are shown in Table II.

TABLE II

NUMBER OF EMPLOYEES IN NON-AGRICULTURAL ESTABLISHMENTS

(in thousands)

	September 1946	September 1947
Manufacturing	15,035	15,696
Mining	884	893
Construction	1,747	1,924
Transportation and public utilities	4,064	4,141
Trade	8,523	8,700
Finance	1,534	1,585
Service	4,456	4,633
Government	5,605	5,425

EMPLOYMENT IN MANUFACTURING

Indexes of employment in durable and non-durable goods generally showed no major changes from September of 1946 to September 1947, being somewhat higher in 1947 for both groups. (See Table III.) The decline from 177.7 in the wartime peak year to 156.7 in September 1947 (high point for first nine months of 1947) reflected the great shifts of workers out of manufacturing into distributive and service trades and other non-manufacturing pursuits after the war ended.

TABLE III

INDEXES OF MANUFACTURING EMPLOYMENT BY INDUSTRY

September 1947 and 1946
(1939 = 100)

	Sept. 1947	Sept. 1946
All Manufacturing	156.7	149.5
Durable Goods	179.5	173.1
Iron and steel and products	159.3	152.7
Elec. machinery	218.9	217.3
Other machinery	224.3	210.3
Transportation equipment, except automobiles	257.4	286.8
Automobiles	199.2	196.0
Lumber and timber basic products	161.6	138.6
Non-durable Goods	138.7	130.9
Textiles and fiber products	104.2	105.2
Apparel and other finished textile products	145.6	132.9
Food	161.1	137.5
Tobacco	92.3	93.5
Chemicals and allied products	195.2	184.0
Printing, publishing and allied industries	130.7	122.3

The index was forced down from the wartime peak by large relative declines in durable goods employment in the post-war period; in September 1947, non-durable goods manufacturing, largely for general consumer use, was at a relatively higher level than during the war when such production was curtailed drastically. (See Table IV.)

TABLE IV

INDEXES OF EMPLOYMENT OF PRODUCTION WORKERS IN MANUFACTURING

(1939 = 100)

	All Manufacturing	Durable Goods Group	Non-durable Goods Group
1943 Average	177.7	241.7	127.4
1947			
January	152.7	178.0	132.8
February	153.7	180.1	133.0
March	154.0	180.9	132.8
April	152.9	180.8	130.9
May	150.6	178.0	129.1
June	151.4	179.7	129.1
July	149.9	174.7	130.3
August	153.8	177.1	135.4
September	156.7	179.5	138.7

Iron and steel and products employment rose almost uninterruptedly during the 12 months ended in September 1947. Employment in electrical machinery, however, declined almost to the 217.3 level of September 1946 after a steady increase to over 230 in the spring of 1947. Radio and phonograph and communication equipment employment experienced sharp losses over the year, accounting for the over-all decline in this industry. Employment in other machinery fields, whether the manufacture was for industrial or ultimate consumer use (agricultural machinery, business machines, washing and sewing machines, etc.), held steady or increased, a notable exception being employment in the manufacture of machine tools.

MINING EMPLOYMENT

Employment in coal mining was substantially below 1939 levels in 1947. Employment in bituminous mining was well below 1946 levels also, though anthracite mining and metals mining employment rose from the previous year. There was only one brief work stoppage in coal mining in 1947, so that violent employment fluctuations, often reported in the past, are not evident in the indexes. As pointed out in the 1946 edition of THE AMERICAN YEAR BOOK, the employment problem in the bituminous branch of the industry is one of over-supply of labor from the long-run standpoint. Indexes of employment in mining in 1947 are shown in Table V.

TABLE V

INDEX OF EMPLOYMENT IN MINING

(1939 = 100)

	Anthracite	Bituminous	Metals
January	83.4	90.8	87.2
February	82.9	90.4	87.6
March	81.8	89.7	88.6
April	80.1	83.0	89.6
May	81.1	88.1	89.4
June	80.3	88.7	90.4
July	78.7	81.8	89.1
August	81.4	88.1	89.5
September		89.0	88.4

EMPLOYMENT IN CONSTRUCTION

Private construction continued at high levels in 1947. According to the U. S. Department of Labor, activity was not limited by shortages of manpower or materials, but rather by continually increasing costs. Employment by private construction contractors continued its post-war increase in 1947, and reached a peak of 1,904,000 in September (excludes force-account workers and employees of non-construction firms and self-employed construction workers). In November, 1,852,000 were employed, compared to 1,712,800 in November 1946 (U. S. Bureau of Labor Statistics). Government construction remained at low levels compared to private activity. Federal and state highway construction and maintenance employment were on higher levels than in 1946, however, and in August 1947, 295,234 were reported employed on such work, compared to 236,644 a year earlier.

EMPLOYMENT IN UTILITIES AND TRADE

Employment in electric light and power, transportation, and telephone companies was higher in 1947 than in 1946, but employment in telegraph activities showed some decline. Utilities normally have relatively stable employment; the year's increases were in response to continued heavy demands on their facilities by business and consumers in the post-war recovery period. Employment in trade, also usually stable compared to industrial employment, increased above 1946 levels. Figures for selected months in 1947 are shown in Table VI.

EMPLOYMENT ON RAILROADS

Employment on railroads declined generally in 1947 for the third successive year, apparently resuming a prewar trend. By September 1947, an estimated 1,410,000 were employed on Class I railways, about the same number as a year earlier. This number greatly exceeds, however, the pre-war employment. In 1939, an average of less than 1,000,000 was employed. It is also not far below the peak of recent railway employment in 1945. (See Table VII for monthly employment indexes.)

TABLE VI

INDEXES OF EMPLOYMENT IN UTILITIES AND TRADE

(1939 = 100)

	January 1947	April 1947	July 1947	September 1947
Public Utilities				
Electric Light and Power	102.5	104.8	109.3	110.1
Street Railways and Busses	130.9	130.9	130.9	130.0
Telegraph	104.6	104.5	101.5	
Telephone	185.2	127.2	193.3	194.5
Trade				
Retail	110.5	111.5	110.2	112.1
Wholesale	112.2	110.5	111.1	113.7

TABLE VII

INDEXES OF EMPLOYMENT ON CLASS I STEAM RAILWAYS

(1935–39 = 100)

	1947	1946
January	130.5	141.0
February	129.7	138.4
March	129.9	138.4

May	133.8	132.4
June	134.8	134.6
July	135.5	136.6
August	135.5	138.8
September	—	—

AGRICULTURAL EMPLOYMENT

According to the U. S. Bureau of Agricultural Economics (*Farm Labor*), there was a generally adequate supply of farm labor throughout 1947. Farm labor even exceeded the available jobs in some parts of the country. Migratory workers along the Atlantic Coast, for example, ran into longer gaps between Florida and northern jobs than usual because of adverse weather conditions.

The decline in the use of family labor compared to 1935-39 continued in the country as a whole. In the middle Atlantic, Mountain, and Western States particularly, more hired labor was used than in the war period. Increased use of farm machinery, however, has encouraged again the restriction of labor to family members in the staple crops, since machinery simplifies the production and harvesting problem for such crops. Truck crops, fruit, and specialty crops, however, still require hired labor because of less adaptability of machinery, and these are the crops widely grown in the Middle Atlantic and Western States.

The annual average number of persons employed on farms in 1910-14 was 12,052,000, of which 9,160,000 were family labor. The December 1935-39 average was 9,736,000, of which 7,465,000 were family labor. In December 1947, total employment was 9,402,000, of which 7,298,000 was family labor. Total employment has dropped from an index of 90 (1910-14 = 100) in December 1935-39 to 86 in December 1947.

A special study of agricultural productivity by the U. S. Bureau of Labor Statistics (*Productivity in Agriculture 1909-1946*) further emphasizes the long-run declining demand for farm labor. Between 1909 and 1946, according to this report, farm production increased 51 per cent, but employment declined 18 per cent. Greatly increased output per worker (84 per cent) over this period is attributable to more efficient farming methods.

Changes in production and in employment in various farming areas are shown in Table VII. The data are from the special study referred to above.

UNEMPLOYMENT

Information on unemployment is obtained from two sources, the estimates of the U. S. Bureau of the Census and the unemployment benefit claim reports of the states and the Railroad Retirement Board national system. Unemployment reported from the first source relates only to persons without any job for as long as 30 days or more, while benefit claims are received from persons laid off from insured employment or on part-time and actively seeking work, irrespective of the duration of the layoff. (For a description of the differences in these two sets of figures, see THE AMERICAN YEAR BOOK for the year 1946.)

Because of the restricted definition used, the Census figures are smaller than the unemployment claim figures. The former are given in Table I. Weekly continued claims for state unemployment benefits amounted to 3,742,000 in September 1947, a decline of 153,000 from a year earlier. There was a steady and sharp decline in the number of persons receiving benefits in the first nine months of 1947, important factors being the expiration of rights to benefits for thousands of war workers and post-war occupational resettlement. Insured unemployment was heavy, however, on the Pacific Coast and in the Northeast compared to coverage in those two regions. In the Northeast, for example, the number unemployed was 36.9 per cent of the national total in September 1947, and the West Coast contributed another 16.8 per cent.

TABLE VII

INDEXES OF PRODUCTION AND EMPLOYMENT BY FARMING AREA

(1939 = 100)

Area	Production		Employment	
	1935	1946	1935	1946
Corn	88.6	117.9	103.2	95.8
Western dairy	90.7	116.6	105.5	93.2
Eastern dairy	97.0	113.0	97.0	96.7
Eastern cotton	105.4	103.9	106.7	89.5
Delta cotton	79.6	82.7	104.2	90.0
Small grain	103.2	146.3	105.7	98.5
Western cotton	98.0	91.6	101.2	88.5
Middle Eastern	89.2	117.0	107.0	91.7
Range	91.1	119.7	106.7	98.6
California	85.9	124.5	94.9	107.5
Northwestern	95.0	116.7	94.8	100.0

The absorption of veterans of the Second World War in employment, as reflected by claims under the Servicemen's Readjustment Act, has been rapid. By September 1947, only 315,000 new claims were being received, the lowest number since the program reached its first peak after the war. Weekly continued claims by veterans in the month of September 1947 amounted to 2,663,140.

Total separation rates (separations from employment per 100 employees) were lower than in 1946 during the first nine months of 1947, but the drop was mainly attributable to a decline in the rate of voluntary quitting and in military and miscellaneous separations. The layoff rate was higher in July and September than a year earlier, and, although lower than in 1946 in other months, did not show such a sharp decline as voluntary separations. Accession rates were generally lower than in 1946.

This combination of movements in labor turnover reflects the tightening of employment conditions in 1947. Voluntary quitting by workers always declines when jobs are getting scarcer. The slackening of accessions and slight increase in the layoff rate reflect the general adequacy of the labor supply for production in 1947.

RELIGION AND RELIGIOUS ORGANIZATIONS

INTERDENOMINATIONAL ACTIVITIES

By PRESTON KING SHELDON
EDITOR AND WRITER

WORLD COUNCIL OF CHURCHES

Although the World Council of Churches had not yet been formally organized in 1947, extensive operations were being carried on preparatory to its first world assembly, scheduled for Aug. 22 to Sept. 5, 1948 in Amsterdam, The Netherlands. The work was being supervised by a provisional committee which had been set up in Utrecht in 1938 (see THE AMERICAN YEAR BOOK, 1938, page 606). The preliminary approaches to the World Council were: the missionary, launched in a world conference on missions in Edinburgh, in 1910, from which evolved the International Missionary Council; the social and cooperative, which was emphasized in 1925 in Stockholm, Sweden, with the launching of the Universal Christian Council for Life and Work; and the interpretive which was begun in the first World Conference on Faith and Order in 1927, in Lausanne. The Life and Work and Faith and Order approaches eventually were coordinated through the holding of a second conference in 1937, in Oxford and in Edinburgh, respectively (see THE AMERICAN YEAR BOOK, 1937, page 613). The plan which eventually resulted in practical operations of Protestants on a world-wide scale, was accepted in principle at these two gatherings, and the World Council of Churches resulted. The International Missionary Council was fully recognized, and cooperation between the two bodies grew until, by 1947, the World Council of Christian Education, successor to the World's Sunday School Association, organized 58 years before, had formed a joint commission with them to carry on Christian education.

In preparation for the 1948 assembly in Amsterdam, the study department of the World Council of Churches undertook special investigation of the social message of the Bible. Four commissions were created to each of which an aspect of the general theme of the assembly, "Man's Disorder and God's Design," was assigned. These aspects were: (1) the Universal Church in God's Design; (2) God's Design and Man's Witness; (3) the Church and the Disorder of Society; (4) the Church and International Affairs. Two years of study were undertaken by the commissions which involved conferences in Europe and North America for adults and young people. In cooperation with the International Missionary Council, the interest of younger churches was invited. In many countries, study groups were organized. The Faith and Order proponents followed plans laid in 1937 at Edinburgh in a scheme of study conducted by three other commissions on doctrines, worship, and inter-communion. Young people were being brought together also through the ministrations of a youth department of the World Council of Churches with the collaboration of the World's Alliance of Young Men's Christian Associations, and Young Women's Christian Associations, World's Student Christian Federation, International Missionary Council, and World's Sunday School Association and its successor, the World Council of Christian Education. Joining in this effort were the Foreign Missions Conference of North America and the Home Missions Council of North America, along with the Student Volunteer Movement, United Student Christian Council, and the Student Christian Movement of Canada, which five groups were sponsors, in late December 1947, of a conference for several hundred college students of North America at the University of Kansas, Lawrence, at which the work of missions was studied.

By December 1947, there were 127 churches in 39 countries affiliated with the World Council of Churches, and, of these, six of the new members in 1947 were Eastern Orthodox communions, a fact which was hailed as highly significant of new trends occurring in Christian faith and practices. The new Orthodox affiliates were the Patriarchates of Jerusalem, Antioch, and Alexandria, the Coptic Church, Egypt, the Syrian Orthodox Church of Malabar, India, and the Church of Greece.

CHURCH WORLD SERVICE

Church World Service, organized May 7, 1946 to serve in the field of overseas relief and reconstruction, had as its parent bodies the Foreign Missions Conference of North America, Federal Council of the Churches of Christ in America, American Committee of the World Council of Churches, and United Council of Church Women. By the summer of 1947 it had set up a committee on displaced persons through which the whole program of American Protestant and Orthodox churches for displaced persons would be channeled. In its first year, reconstruction funds of $10,000,000 with relief supplies, made a total of $15,000,000 sent to 29 countries in Europe and Asia, contributed by more than 30 denominations. By the beginning of 1947, the organization had set up a goal of $1,000,000 a month in funds and 1,000,000 pounds a month of clothing, shoes, and bedding. Gifts of money fell short of the desired goal most of the year, but gifts in kind went ahead of schedule by August, in which 2,000,000 pounds were sent and the year's goal was advanced to 20,000,000 pounds. Before the end of 1947, 42 countries were reached. A goal of $60,000,000 for 1947 and 1948, one-half to be channeled through Church World Service, was seen as a need for overseas relief following discussions by representatives of 16 Protestant denominations, in May 1947 in New York City, who came together at the suggestion of the Federal Council of the Churches of Christ in America. Representatives of the World Council of Churches and the Foreign Missions Conference of North America also attended. Needs foreseen for the years 1948-52 were outlined to the gathering by Herbert C. Lytle Jr., associate director of Church World Service.

FEDERAL COUNCIL OF CHURCHES

In a statement on the Churches and World Order in September, 1947, the Federal Council of the Churches of Christ in America called for renewed dedication to the purposes of the United Nations through its Department of International Justice and Good Will. The statement was sent to churches to be read on the second anniversary of the United Nations. The Federal Council launched a new department in 1947, moved by increased recognition of the importance of economic life to human welfare, religion, and social progress. The department was organized by expanding the Industrial Relations Division of the Department of Social Relations into a full department of the Council. Announcing the step, the Council cited as a factor in prompting it a conference held Feb. 18-20 in Pittsburgh, Pa., in which laymen predominated two to one of clergy and in which business, organized labor, and agriculture were all represented. The new department was to "seek to follow up this wide new interest." Regional "little Pittsburgh conferences" were planned under the auspices of state and local councils of churches. It was planned for the new department to carry on the previous activities of the Industrial Division, including publication of Labor Sunday messages and public statements on specific economic problems; information to the churches on labor and social legislation; publication of pamphlets and other literature in the field of the church and economic problems and the religious significance of these problems; cooperation with national Catholic and Jewish groups; investigation of industrial problems; techniques for churchmen in economic education and action; conferences on specific economic problems, such as consumers' cooperatives and labor-management relations. Arthur S. Flemming of the United States Civil Service Commission was named chairman of the new department. Its 1947 Labor Sunday Message called for study of methods to avoid "recurrent business depressions in which unemployment rots the souls of men." Responsibilities of the churches listed included seeing that no congregation permitted class or race distinctions; rejection of ideas "that most employers are greedy conspirators who combine in gigantic soulless corporate entities," and "that organizations of employees are usually a rabble led by demagogues."

The Federal Council was one of 65 agencies represented at a conference on local health units in September 1947, under the auspices of the American Public Health Association. Evidence was reviewed "demonstrating that a third of the national population is without the services of an organized health department and an additional third is served by a staff which is obviously insufficient." The conference proposed workable and non-controversial standards of improvement. The churches of America were urged by Charles P. Taft, president of the Federal Council, in a special plea in October 1947, to "seize the moral initiative" in the national voluntary food conservation program.

The Council's executive committee issued several statements in 1947 covering questions at issue in the public mind. Its general secretary, Samuel McCrea Cavert, published in January a denial of charges by "a few captious voices" against Martin Niemoeller, militant German Lutheran pastor, who had arrived in the United States in December 1946, for a speaking tour extending into 1947. The allegations listed were: (1) Niemoeller was once a member of the Nazi party; (2) he had no quarrel with the political objectives of Hitler and was concerned only with a defense of the Church; (3) he had not admitted the moral responsibility of the German people for their treatment either of the Jews or of the peoples of invaded nations. Dr. Cavert said no evidence existed to prove the first allegation, although it was true Niemoeller had voted for the Nazis in a minor election in the earlier period of their movement, but "this was a time, however, when not even the Americans who had abundant opportunity to view the German situation objectively were yet alert to the menace of Hitler's leadership." It was recalled that Niemoeller in 1933 "broke so completely with Nazism that the press and the radio of the world made it a feature story." Documented evidence of Niemoeller's opposition to Nazi political objectives could be found in "the famous letter of the Evangelical Church to Hitler in June, 1936" which "was widely quoted in the press," Dr. Cavert continued. He said in denial of the third allegation, that Niemoeller had declared before a representative meeting of the German Church in Stuttgart, in October 1945 which Dr. Cavert attended, that it was not enough to blame the Nazis, but that Christians also had to confess their share of guilt.

The first churchman from the Russian zone of occupation in Germany to visit America was Otto Dibelius, Bishop of Berlin and Brandenburg, who came in October 1947. He declared German Protestant groups since Hitler had been aroused to a new consciousness of world Christianity. He saw signs of a new religious outlook among university people, scientists, journalists, and public leaders in Germany.

Among the pronouncements of the Federal Council's executive committee was one in January 1947, reaffirming "continued adherence to the American principle of separation of Church and State and to the principle that public funds should not be used for sectarian purposes." Efforts in Congress to obtain appropriation of Federal funds to improve educational standards, however, were approved if not used "in such a way as to discriminate against any minority racial group," if there would be no Federal control of educational policy, and if said funds went only to such schools as were eligible for state support. Another statement in July called for the United States to place greater dependence on the demonstrated moral power of the United Nations General Assembly. "The supreme and critical issue is that of the free society versus the police State," it stated. This statement was prepared by the Commission on a Just and Durable Peace of which John Foster Dulles was chairman. It cautioned against yielding to a growing hysteria "at a time which is so critical that calmness of judgment is indispensable." In November, the executive committee reaffirmed also its opposition to compulsory military training.

WORLD COUNCIL OF CHRISTIAN EDUCATION

The name of the World's Sunday School Association was changed to World Council of Christian Education at its first post-war meeting in August 1947 in Birmingham, England. More than 100 delegates attended. The organization held its first meeting in 1889 and was incorporated in the United States in 1917. Since 1928, aid in organizing and supporting international interdenominational organizations has been given in India, China, Japan, Korea, Philippine Islands, Brazil, Argentina, Uruguay, Chile, Mexico, Cuba, Puerto Rico, South Africa, Belgian Congo, Southern Rhodesia, Egypt and Sudan, Palestine, Syria, France, Germany, Holland, Switzerland, and Bulgaria. In each of these countries had been started a Sunday School association or council of religious education. The world association was chiefly supported by individuals.

By 1947, it had 52 constituent units, national or international in scope, and was operating in 55 countries. The change in name resulted from expansion of the organization's work to include all phases of Christian education, extending beyond the limits of Sunday Schools. One of the first projects undertaken, following the change in name, was the establishing of a department of visual aids in Christian education. The new department set itself to review religious films and give counsel to organized bodies in projection of motion and still pictures. Offices were planned in London, New York, and Geneva, with staffs. J. Arthur Rank, British film producer who proposed the project, underwrote the expense of establishing the London office, and Mrs. Clifford S. Heinz of Pittsburgh, Pa. provided funds to set up the New York office. Rank started erecting a special studio in England for production of religious films. Other departments were set up for work with youth and children. In recognition of his work in behalf of religious motion pictures, Rank was honor guest in New York, May 9, 1947, at a meeting of the World's Sunday School Association, at a luncheon at which a scroll was given to him as a tribute. Francis S. Harmon, vice-president of the Motion Picture Producers and Distributors of America, welcomed Rank.

The general budget of the organization in 1947 was $94,074. Grants-in-aid were made in 1947 in Bible Lands to Brazil, Ceylon, China, Belgian Congo, Egypt and Sudan, Indonesia, Mexico, Philippine Republic, and Puerto Rico. An appropriation was also set aside for Japan and Korea as soon as such aid could be extended. Additional grants were made through the British Administrative Committee of the Council to India, Madagascar, and several European countries. Restoration projects were being carried out in war-torn areas, particularly in Finland, Holland, and Czechoslovakia. A new monthly religious magazine was founded for children in Greece with aid from the original World's Sunday School Association.

YOUNG MEN'S AND YOUNG WOMEN'S CHRISTIAN ASSOCIATIONS

The World's Committee of Young Men's Christian Associations met in plenary session in Edinburgh, Scotland in August 1947, for its first postwar meeting. The effects of war were faced by 250 delegates from some 48 countries, together with the new factors arising from the world military struggle as they were affecting young people. The delegates considered these matters on behalf of Y.M.C.A.s in 70 countries which were federated in the World's Alliance of Y.M.C.A.s, of which the committee was the permanent agent. The major emphases in the conclusions reached in a ten-day meeting were on reconstruction in war-devastated areas, on expansion and extension to meet urgent calls from unoccupied areas, and on a positive Christian message to the youth of all lands. It was found imperative to continue emergency services among prisoners of war and displaced persons, and to work for early resumption of normal pre-war services to national Y.M.C.A. organizations.

Dr. Tracy Strong, general secretary of the World's Committee of Y.M.C.A.s, subsequently made a field trip to South America, and as 1947 ended was preparing for a trip to London and Geneva, in continuation of a worldwide tour begun by him before the meeting in Edinburgh. He had visited, before August, enough areas to assist 38 consultants who visited 62 countries conducting an intensive survey of youth conditions. In summary of his observations, he said: "These are the persistent impressions which stand out vividly above all others: (a) suffering is worldwide, involving youth tragically, but youth still lives in hope; (b) youth seeks a larger share in life's controls and is coming to the fore in many countries where age heretofore has been completely dominant; (c) the times demand a greatly strengthened leadership; (d) there is a widespread yearning for the universal and a chance to participate effectively in a world movement; and (e) there is a hunger everywhere for spiritual reality."

The Edinburgh meeting marked the end of the presidency of the alliance and of the committee of Dr. John R. Mott, who was immediately made Honorary Life President of both. John Forrester-Paton of Alloa, Scotland was elected to succeed him in his active post. Permanent headquarters were established in Geneva, Switzerland. An office was established at 347 Madison Avenue, New York in the fall of 1947 as a result of action at Edinburgh looking toward expanding the world Y.M.C.A. program in international affairs and a closer liaison as a non-government agency with the United Nations. Wesley F. Rennie, associate general secretary, took his post Nov. 1, 1947 in New York as representative of the World's Committee in the United States.

The Y.M.C.A. of the United States reported a total of 1,540 Y.M.C.A.s with 73,906 dormitory beds and professional employed staff of 3,394. There were 207,320 volunteer workers and 1,665,722 members. Total expenditures were $84,685,300 in 1946. Total investment in plants and equipment was $231,323,800. Total personal counseling interviews was 1,266,992; jobs obtained, 14,556; meals served, 46,813,000. The Y.M.C.A. in the United States and Canada started a drive for $8,650,000 in May 1947, to restore buildings destroyed or damaged by war.

The Y.W.C.A. reported a constituency of 3,000,000 business and professional women, industrial workers, home women, war brides, college students, and teen-age girls. A goal of $2,100,000 for a three-year program of post-war reconstruction overseas was launched early in 1947 and oversubscribed. An additional $500,000 was required in 1946 and 1947 for domestic purposes. These sums were in addition to regular budgets.

By the end of 1947 the Y.W.C.A. had sent 20 secretaries to 16 countries. It already had 16 secretaries in ten countries and some form of aid was being given to 29 countries. Leadership training was going on in Delhi, India. In Shanghai, China, a joint Y.M.C.A.-Y.W.C.A. leadership program, launched in 1945, was continued. Exchange students came to the United States from China, Italy, France, Belgium, Great Britain, and Uruguay.

A series of 20 leadership institutes started by the Y.W.C.A. in the United States in the fall of 1946 was completed in the spring of 1947. Other meetings included seven area conferences in the summer of 1947 at which women and girls studied problems of budgets, health, and other economic questions. Ten delegates from the American Y.W.C.A. attended the first World's Council of the Y.W.C.A. in October in Hangchow, China with 22 nations represented.

CHURCH PEACE UNION

Conferences of non-Christian as well as Christian religious leaders are planned for 1948 under the auspices of the Church Peace Union, which was organized in February 1914, by Andrew Carnegie. Dr. Ralph W. Sockman of Christ Church (Methodist), New York City, was elected president, succeeding Dr. William Pierson Merrill, who became president emeritus after holding the post 30 years. In furtherance of plans for the conference the peace union's members joined with the American Association for the United Nations in attending the thirty-second annual meeting of the World Alliance for International Friendship through the Churches, in Boston, Nov. 14-16, 1947. A conference of Roman Catholics, Protestants, and Jews was held as preliminary preparation for the 1948 project. As the year 1947 ended, the alliance and the peace union were preparing to move from offices at 70 Fifth Avenue, New York, to new headquarters in a building purchased at 170 East Sixty-fourth Street, New York.

The Church Peace Union, at a semiannual meeting in June in Atlantic City, likewise attended by representatives of the three major religious faiths, of which its membership is composed, issued the following statement as to its position on the international situation, which received considerable publicity:

"The Church Peace Union believes that the ultimate test of all our decisions and policies, both national and international, is their effect on human beings. No consideration, however urgent or pressing, should precede or supersede the prior and predominating one of human rights, and equally, any proffered solution of today's complex concerns, economic, social or political, will be right and lasting only to the extent that it secures justice and decency for our fellow men across the world.

"This is one world, physically and scientifically, and it must be made one world politically and economically. To achieve this, all nations must think in terms of the whole rather than of any one part. The United Nations is the accepted instrument which should receive the wholehearted support of all nations. There must be no more by-passing of the United Nations. No country should depend upon its own financial or military might to achieve its ends.

"A tremendous force for strengthening the United Nations will come in our acceptance of it as the guarantor of peace rather than attempting this by our own strength. We have an obligation to work through the United Nations in matters relating to world peace rather than deciding for ourselves the international standards of peaceful conduct. In the United Nations, each nation has the opportunity to present and urge its own views.

Should such persuasive efforts fail, each nation is in duty bound to accept the larger will as expressed through the United Nations.

"The United States has the further obligation not to use its financial assistance abroad in support of reactionary elements nor to impose its own systems upon other peoples. Trade and tariff policies should be shaped, not for the benefit of groups or nations, but for the welfare of all mankind. American economic resources should be employed not merely for relief but for purposes of rehabilitation. We are anxious to see peoples of the earth become self-supporting, and to evolve their own way of life. We should give every encouragement for all peoples to choose freely their own systems of government.

"Men and women today are living in a state of nervous apprehension. There seem to be so many convincing reasons that we are drifting into an inevitable war. This trend must be arrested. It issues out of our fear, and fear can create out of its own dread the thing it contemplates. Let us rally our hopes. Hope of dealing successfully with the hard facts of life depends ultimately upon our moral enthusiasm and our spiritual insight. When we really want peace we shall find the skill and the wit to bring it to pass.

"The issue of war or peace lies in the minds and hearts of men. Pride, greed, hate, fear and ignorance are the primary causes of war. Organizations of men's devising, however excellent, can not of themselves insure peace. They must be animated by the right spirit, *viz.*, that of unselfishness, forgiveness, cooperation, patience and understanding. To instill and increase that spirit, not only in our leaders but among all the people, is the chief task of such organizations as the Church Peace Union and the inescapable duty of all who believe in the Fatherhood of God and the consequent brotherhood of man. Above all we are dependent upon the power and guidance of a loving and righteous God, the high and mighty ruler of the universe. 'In His will is our peace.'"

The Church Peace Union was represented by Dr. Henry A. Atkinson, general secretary, and Dr. John I. Knudson, head of the economics department, Brooklyn Polytechnic Institute, at a hearing of the Committee for Reciprocity Information in Washington, D. C. Jan. 14, 1947. On the question of continuing reciprocal trade agreements and broadening their scope, the peace union's conviction was registered that there must be "one world" or no world at all; that in this industrial age we depend for our security primarily on good economic relations among all the nations.

It was recommended that the United States take immediate steps to reduce trade barriers and make effective the International Trade Organization "under the aegis of the United Nations." It was maintained that "a high standard of living for our own country can not be maintained permanently in an impoverished world. Hungry and starving people, unable to make, sell, and buy goods, are a danger to the security of themselves, their neighbors, and the world. Charity can not continually level up accounts that can better be met on a basis of sound economics and the basic human right to adequate means of support through a job and fair wages. These rights depend upon good markets and fair treatment between buying and selling nations. . . .

"The only sound basis for the reconstruction of our world is through the recognition that our responsibility goes farther than the mere feeding of the people who are hungry, cold and discouraged now and need our help. They need more: the encouragement to start their lives anew so that all may have the opportunity to live 'free from want and the fear of want.'"

CHRISTIANS AND JEWS

The organizing of an International Council of Christians and Jews was begun at an international emergency conference in Seelisberg, Switzerland, in August 1947, with plans to open headquarters in Paris. The start was made to implement a suggestion for it from an international conference in Oxford, England, in the summer of 1946. Work was also begun in 1947 in organizing new councils of Christians and Jews in 17 cities in Europe to be affiliates. The over-all project was an expanding of activities in other countries patterned on the National Conference of Christians and Jews in the United States, which was started in 1928 and by 1947 was serving in 500 cities, including Chicago, Dallas, Baltimore, Des Moines, and others, where early beginnings originated following the rise of the Nazis to power in Germany. By 1947, there were 47 full-time and 17 part-time offices serving the 500 cities. Programs were being conducted at special times, as in Brotherhood Week in February, in 2,000 other communities. The total program cost $1,450,000 in 1946-47.

The national conference carried on its work through educational, religious, and community organizations, radio, motion pictures, theatres, newspapers, books, and magazines. Advertising of these activities was done with the aid of the Advertising Council of America. In 1946 the National Conference of Christians and Jews set up its commission on community organizations, founded the Religious Radio Association, and was sponsor of a study in religion and education with the American Council on Education.

Organizations modeled on the National Conference of Christians and Jews had existed for several years in Canada, Great Britain, South Africa, and Australia. As 1947 drew to a close, beginnings were being made to cultivate relations with the United Nations and its dependent organizations, particularly the United Nations Educational, Scientific, and Cultural Organization, to gain assistance in a fight on anti-Semitism, initiated in a document drawn up in Seelisberg, following discussions dealing with the object of eliminating "emphases in Christian religious teaching which tend unwittingly to encourage or perpetuate anti-Semitic attitudes in Christians." The statement was submitted to authorities of the various churches for study. Attending the Seelisberg Conference were Christians and Jews from Australia, Austria, Belgium, Bulgaria, Czechoslovakia, Denmark, France, Germany, Great Britain, Greece, Hungary, Italy, Luxemburg, Norway, Poland, Rumania, Switzerland, and the United States.

The denial by Congress in its Eightieth session of funds to complete a census of religious bodies estimated to need $471,000 for additional work on it through June 30, 1948, caused concern among leaders of Protestant, Roman Catholic, and Jewish bodies in 1947. The Association of Statisticians of American Religious Bodies, meeting in New York in November 1947, called on Congress to provide the needed funds and to make the taking of a Federal decennial census of religious bodies mandatory.

A religious census had been scheduled for 1946 but was suspended with an estimated 60 per cent of replies to questionnaires to the middle of 1947, when funds allotted by the Seventy-ninth Congress ran out. Religious leaders were becoming disturbed over the lack of adequate countrywide religious data, one of the reasons given being that the last decennial census of religious bodies in 1936 fell short of completeness because an estimated 20 per cent of clergymen and church officials did not fill out census information blanks.

MISSIONS

Social work projects of 13 denominational boards in Protestant communions affiliated with the Home Missions Council of North America used nearly $6,000,000 in 1946, a report to the Council's opening session of its annual meeting in Buck Hill Falls, Pa., in January 1947, stated. There were 251 institutions supported, nearly half of which were community centers. Others were day schools, boarding schools, children's homes, and residences for retired missionaries. Medical work was done in hospitals and health centers. More than 2,400 professional and maintenance workers were employed in these institutions. Special staff workers were appointed in one communion to set up centers in church buildings or local schools to meet the juvenile delinquency problem. Increased emphasis was placed upon improving race relations and promoting adult education. Other trends included closer cooperation with community agencies and local courts. The council adopted an operating budget of $306,000 for 1947. Dr. Mark A. Dawber, executive secretary of the Council, in his annual report, attributed much of the world's starvation not only to war but to a "selfish monopoly of land and resources." What was being done in the United States for human welfare would greatly affect attitudes in this field in other parts of the world, he added.

The work of the Home Missions Council in migrant camps reached an estimated 200,000 persons in 1946, according to Edith E. Lowry, executive secretary, in her report. The ministrations of the council included services of wide variety in 26 states, such as counseling, religious services for youth and adults, play nights, traveling libraries, clubs, child care, literacy programs, leadership training, labor relations, interpretation of migrant to community and community to migrant. A Student Veterans Emergency Committee to aid Protestant ex-servicemen and their families in temporary quarters with religious services was authorized for 1947, to have representatives also from the United Student Christian Council and Federal Council of the Churches of Christ in America.

Seven types of communities were analyzed and discussed by 200 religious educators at a national conference on the community and religious education, Dec. 2-5, 1947, in Columbus, O., under the auspices of the Home Missions Council and the International Council of Religious Education. The former represented 23 Protestant denominations in the United States and Canada, and 90 per cent of Protestants were reported to be working together on religious education projects under the auspices of the latter in the two countries. The latter had representatives of 40 denominations and 634 interdenominational councils affiliated. Its projects included week-day religious education as well as Sunday School programs. It was estimated that there were 2,000,000 pupils in 2,200 communities in 46 states in released time projects, in 1946, most of the projects being interdenominational. At least 4,730,000 boys and girls of the United States and Canada were estimated to have attended daily vacation Bible schools in 1946.

The types of communities studied in the December meetings were the rural-agricultural, rural-industrial, county seat towns, small cities, large cities, suburban and metropolitan communities. A findings committee worked out a statement of basic philosophy, a summary of conference discussions on major addresses and recommendations: "The church has a mandate in the very nature of its origin and existence to sense the ends of the community, to create a society which recognizes all individuals as children of God, and all possessions as God's gifts," the findings stated. A joint committee on community development was recommended to be set up by the sponsors of the Columbus meeting and the Federal Council of the Churches of Christ in America. The general secretaries of these agencies were asked to name a committee of theologians, sociologists, and religious educators to develop "an adequate and contemporary theological basis for the social, theological, and educational responsibility of the Church in the community." The sponsoring councils were asked to "examine their present experimental projects, reshaping and redirecting them in such a manner as is necessary to be in accord with the philosophy of community and to fulfill the purposes of this conference." Protestant lay groups were urged to develop programs which would interpret "careers of community, social, civic and political service as life-long opportunities for Christian service." The conference was the first attempt nationally by Christian educators to develop a strategy for the development of a Christian community. The findings were submitted to the sponsors of the conference for editing and publication after approval of them by each of the two councils. Harold E. Stassen, president of the International Council of Religious Education, was conference chairman.

THE FOREIGN MISSION FIELD

A total of $32,829,804 was expended for overseas mission work in the fiscal year 1946 by 100 Protestant mission boards and agencies in the United States and Canada affiliated with the Foreign Missions Conference of North America. More than half that amount, or $19,754,976, was sent to foreign fields by mission boards representing the following denominations: Seventh Day Adventists, Southern Baptist Convention, Methodist Church, Presbyterian Church in the U. S. A., Assemblies of God, Protestant Episcopal Church, and the Congregational Christian Church. Represented among the contributing boards and agencies were 66 Protestant denominations. The conference approved an over-all budget of $456,000 for its area and functional committees for 1947, at its fifty-third annual meeting Jan. 14-17, 1947, at Buck Hill Falls, Pa.

AMERICAN BIBLE SOCIETY

The American Bible Society adopted the largest budget in its history when it chose a goal of $2,981,645 for 1948, of which $1,200,000 was to help meet rising needs for Scriptures in war-torn countries. Among the appeals it received was one from Gen. Douglas MacArthur for Japan. Frank H. Mann, general secretary, following the adopting of the budget, said, if it were achieved it might be possible to meet the general's request for expansion of distribution in Japan.

The Society reported in 1947 that, as soon as the Second World War ended and before missionaries were back at their posts in Japan, Christian leaders there had asked for 150,000 Japanese Bibles and 2,500,000 Japanese New Testaments. A million copies of Scriptures, mostly New Testaments, had been sent by July 1947, and work was continued to supply more. As a means of doing so, plans were made to send 300 tons of paper and binding material to Japan to be made into 1,725,000 Bibles, Testaments, and Gospel selections to be printed and bound there.

When the Society held its 131st annual meeting in May 1947, Dr. Eric M. North, general secretary, reported 11,394,200 volumes distributed in 1946, nearly 4,000,000 of them in the United States. Its distribution abroad was expanded to include Russia when, for the first time in several decades, Scriptures were sent there. They were presented to Archbishop Alexei of Rostov, on the occasion of his visit to this country which began late in 1945 and ended in the spring of 1946 after a futile effort to reconcile the positions of the American Russian Orthodox Church with the Patriarchal Russian Orthodox Church. He later acknowledged receipt of them. The shipment contained 500 ancient Greek New Testaments, which, according to the acknowledgment, were distributed among theological students; 5,000 Russian New Testaments and 100,000 Russian Gospels.

Another gift of Scriptures was made, in October 1947 in New York City, by the Society, to Metropolitan Gregory of Leningrad and Novgorod, when 10,000 Bibles printed in Russian for the first time in this country and in the new Russian orthography and the Holy Synod version, were given to be shipped to Russia. In addition, 5.000 Russian New Testament and Psalms books, 100.000 Russian Gospels, and 1,000 Greek New Testaments were sent. Metropolitan Gregory, like

Archbishop Alexei, had been on a mission of reconciliation the result of which was undetermined when he returned to Russia.

PROTESTANT DENOMINATIONAL ACTIVITIES

By Preston King Sheldon
Editor and Writer

CHURCH CONSTRUCTION

While plans for building Protestant church edifices were announced in January 1947, at a meeting in New York of the North American Conference on Church Architecture, indicating a total cost of $650,000,000, building material shortages later were holding up the projects. A significant trend brought out by the announcement, however, was the unfavorable reaction to houses of worship as units of business buildings. "Skyscraper churches are definitely out," Elbert M. Conover, director of the Interdenominational Bureau of Architecture, said. A trend was noted toward more chapels on college campuses.

RELIGIOUS LIBERTY SURVEYS

Plans for a national organization of Protestants to maintain the actual separation of Church and State were made known in 1947, with representatives of several denominations at work on the project. J. M. Dawson, of the Southern Baptist Convention, who in 1946 had been elected executive secretary of the first joint conference committee on public relations ever to be organized, representing the Northern and Southern Baptist Conventions, the National Baptist Convention, Inc., and the National Baptist Convention of America, became acting secretary of the broader project. Members of the Baptist Joint Conference Committee, representing the major Baptist bodies in the United States, took active part in the Seventh Congress of the Baptist World Alliance in Copenhagen, Denmark, July 30 to Aug. 3, 1947, where in the final session a manifesto on religious liberty was drawn up under which early surveys in all countries were to be made to determine the exact status of religious liberty.

An indication as to the problems faced may be taken from the Baptist Joint Conference Committee's "Report from the Capital," published in Washington, D. C., in October 1947, where headquarters of the Baptist World Alliance were set up following the meeting in Copenhagen. "One of the most disturbing factors in the present deplorable tension between the United States and Russia is the Roman Catholic campaign against Communism," the statement said. "The intensification grows out of the functioning partnership between the United States and the Vatican established through the maintenance of Myron C. Taylor as the personal representative of the President to the Pope." To Baptists this conflict became one between "two totalitarianisms." Baptists find serious defects in both. J. M. Dawson explained the Baptist position to editors as follows: "In Communism, on the one hand, Baptists can not abide its atheism, materialistic philosophy, and denial of freedoms, particularly of religious freedom. In Catholicism, on the other hand, Baptists can not consent to its official intolerance with denial or abridgement of religious freedom to non-Catholics in all lands wherever it has continued dominant. . . . As to the true relationship existing between Church and State, Baptists hold the two should be entirely separate. This does not mean that State and Church should be hostile toward each other, but to the contrary, they should be sympathetically cooperative. . . ."

UNITED CHURCH CANVASS MOVEMENT

The United Church Canvass movement, which had been developed over a period of six years, had spread to every state in the United States, except Utah, Mississippi, and Virginia, by 1947. Communities in Gatun, Canal Zone, and in Honolulu were also conducting canvasses for funds in the fall of 1947 in collaboration with the United Church Canvass. The organization had affiliates from 19 major Protestant denominations, was at work in 300 communities, and had inquiries from 346 new ones by the time the fall canvassing was going on. More than 175,000 pieces of literature and other aids were distributed which was twice that used in any previous season. Each church raised its own funds, joining with others in general planning and promotion. Reports were based on fiscal years ending in different months all the way from Dec. 31, 1946 to April 30, 1947.

General increases in giving were attributable in great part to the canvassing. An all-time high for all purposes was reported by the United Stewardship Council's secretary-treasurer, Dr. Harry S. Myers. The total increase over the previous year was $64,223,647, making a new total of $678,122,157 for 26 denominations in the United States and Canada. Total benevolences increased 17 per cent. The Council held its first conference for laymen, in conjunction with the annual session in Buck Hill Falls, Pa. to emphasize lay responsibility in bringing financial resources to the support of religious projects.

LORD'S DAY ALLIANCE

Contributions from 20 Protestant denominations, totaling $175,000 to support an enlarged program, were sought by the Lord's Day Alliance as it laid plans for the year following its fifty-ninth annual meeting in New York, Dec. 3, 1947. The largest item among its projects was for $50,000 to cover organizing new units and placing of field secretaries. Dr. Harry L. Bowlby, general secretary, reported units had been organized in more than half the states of the Union. Its projects included education, law enforcement, an Americanization program, motion pictures, radio broadcasting, and a study of social conditions on Sundays to be compared with 10, 25, 40, and 50 years before, and a survey of the influence of modern inventions upon Sabbath observance.

The Alliance was informed in August by the Commissioner of Internal Revenue that an Internal Revenue Bureau ruling of June 16, 1944 and prior rulings "holding you not to be exempt under section 101(6) of Internal Revenue Code and corresponding provisions of prior revenue acts are modified." Reconsideration was given to the status of the Alliance as a tax exempt group, resulting in placing gifts to the Alliance in the category of non-taxable income.

SEVENTH DAY ADVENTISTS

The work of the Seventh Day Adventist churches throughout the world at the end of 1946 was being administered in 70 union missions and conferences, 137 local conferences, 204 regularly organized mission fields, and 535 institutions. There were 9,321 churches with 598,683 members. Membership outside North America was 378,561. The total offerings in tithes, gifts for missions, and local church work were $36,016,528, an increase of $4,475,593 over 1945. Relief offerings in 1946 were $1,414,391, an increase of $427,992 over 1945. Total tithes and offerings were $37,430,918, and this sum was greater than 1945 by $4,903,585, an increase of 15.1 per cent. Per capita was $62.52, or $6.09 higher than in 1945. The total of property investments was $118,565,592.

The denomination reported 14,443 Sabbath schools with 707,428 members, the gain over 1945 being 19,147, of which 6,491 were in North America and 12,656 overseas. There were 7,600 young people's societies in the world field, with 171,834 members, representing a drop of 282 societies and 19,819 members from 1945 totals, partially owing to failure to file accurate data.

There were 3,341 elementary and mission schools and 4,772 teachers, with an enrollment of 128,877 students, representing increases over 1945 of 152 schools and 5,296 students. In Seventh Day Adventist colleges and secondary schools throughout the world, students numbered 28,240 in 290 such institutions, having 3,356 teachers and helpers. In the United States and Canada, the college and academic enrollment rose from 17,844 in 1945 to 21,735 in 1946, an increase approximately of 22 per cent.

Fifty-one publishing centers were in operation which employed 1,542 workers. Distributing was in the hands of 2,666 persons. The total of periodicals published was 281. Books and other literature were in 188 languages. Retail sales of books and periodicals were $10,332,186, an increase of $1,040,591 or 11.2 per cent over 1945.

There were 167 sanitariums, hospitals, dispensaries, and treatment rooms caring for 112,904 patients and giving 1,431,415 treatments or medical services to out-patients. In service, were 267 physicians, 1,708 nurses, and 4,480 other employees, in addition to 1,242 nurses in training.

NORTHERN BAPTISTS

The Northern Baptist Convention, at its annual session in May 1947, at Atlantic City, adopted as its minimum unified budget $6,100,000 "plus secondary allotments, to the states and cities, based upon the amount of their undesignated contributions." A total of $1,300,000 was set up for undesignated funds in the budget's section on recurring needs.

The denomination listed in its 1947 year book, covering comparative statistics, a total of 1,592,349 members as of the end of the 1946 church year, and 1,541,991 as of the end of the 1947 church year. The difference was attributable to population shifts caused by the closing up of war industries and the depopulating of military sites for trainees. The drop occurred in non-resident members, going down from 347,406 to 331,342. Baptisms, however, rose from 52,856 to 57,286. There were 63 fewer churches in 1947, the new total being 7,180. All figures were affected by unsettled conditions and resultant incompleteness.

As 1947 drew to a close, the denomination's World Mission Crusade Fund drive for $14,000,000 had been oversubscribed by more than $2,000,000, and before Christmas more than $11,000,000 had been paid in, full quotas having been met by many churches. It was reported at the May convention in Atlantic City that foreign missions would get $4,000,000 of the total.

For the third consecutive year the Tax Vigilance Committee was opposed to two types of Federal tax laws. One permitted automatic deduction of 10 per cent on income tax returns for donations to religious, educational, and charitable work. The other was an objection to proposals to include clergymen under the Social Security Act as contrary to the principle of separation of Church and State. The automatic deduction was reported to be costing churches, hospitals, and educational institutions "the loss of many millions." Statistics were cited that, in the preceding 13 years, expenditures for these had decreased 19 per cent, or about $1,000,000,000, as against an increase in expenditures nationally for luxuries of $58,000,000,000.

Concern was also shown over a ruling by the United States Supreme Court that the Federal Bureau of Investigation had a right of search without warrant, and the convention expressed a conviction this was "in direct violation of Article 4 of the Bill of Rights.

The convention also called for churches represented to make all efforts to restore a spirit of friendly cooperation with Russia through exchanges of correspondence, discussion groups, lectures, literature, and study courses, cooperating with the Inter-

Church Committee of the American Russian Institute.

The American Baptist Foreign Mission Society raised in total income $1,580,646 in the fiscal year ended April 30. The income of the home mission society was $1,235,346.

SOUTHERN BAPTISTS

Gains in church membership were reported for 1946 in the 1947 handbook of the Southern Baptist Convention, which attributed new growth to resuming of peacetime activities and resettling of former military personnel in civilian life. New district Baptist associations were reported in Arkansas, California, Georgia, Louisiana, Tennessee, and Texas, bringing the total to 928 for the territory of the Convention. The greatest gain in number of churches was recorded in North Carolina, with Tennessee, Georgia, California, and Texas following. There were 244 churches reported as disbanded, but a net gain of 267 brought the total churches to 26,401. They were being served by 17,877 active pastors. Churches without services of pastors totaled 3,098.

A survey disclosed that 10,110 churches were on full-time, 8,772 half-time, 7,327 on quarter-time, and 192 on three-quarter time. Of the total, 3,450 were in cities having over 2,500 population; 3,562 in towns of 500 to 2,500; 4,173 in villages under 500 population, while 15,216 were in the open country.

Baptisms reported were 253,361, or 3,338 under 1945, when a centennial evangelistic crusade was being carried on. Church membership gained 213,751, bringing the total to 6,079,305. There were 467 new established church Sunday schools, making a total of 25,435. Total enrollments outside of mission schools were 3,738,924, a gain of 213,614. Including the mission Sunday schools, this total was 3,750,373 and increase was 225,063. Vacation Bible School enrollment reached a new record of 1,064,881. The number of such schools reached 13,145, an increase of 2,923.

The value of church properties reached a new high of $313,053,779 by the end of 1946, an increase of $36,964,008. The year's report showed that 24,979 churches owned church houses, a gain of 447. Homes for ministers reached 6,600, a gain of 1,205. Total debt on church property increased from $6,176,000 in the previous year to $16,450,000. This was offset by $44,280,000 in the building and reserve fund.

Gifts for local church work in 1946 totaled $87,986,245, an increase of $12,018,571. Gifts for missions and benevolences totaled $27,240,704, an increase of $4,749,953. Total gifts for all purposes were $115,226,949.

The annual meeting of the convention was held in St. Louis, Mo., May 7-11. It opposed appropriations by the Federal Government or any of the states to support sectarian institutions, by endorsing a proposed amendment to the Constitution of the United States, covered in House Joint Resolution 187 introduced by Representative Joseph R. Bryson of South Carolina. The Southern Baptists also evidenced "willingness to go further and prohibit the use of public monies for private, non-tax supported institutions of any kind." They also called for admitting to the United States 400,000 displaced persons the next four years.

CHURCH OF THE BRETHREN

The Church of the Brethren, in its year book for 1947, reported a total of 1,018 churches for the year ended Sept. 30, 1946, having a total membership of 182,497. There were 5,742 baptisms, with a net gain of 1,410. The church had 303 full-time and 472 part-time pastors.

The denomination expended $289,319 for missions and $1,137,268 for general education. Total receipts of service funds were $1,148,658, and expenditures were $1,030,401.

All general boards were combined on March 1, 1947 into a General Brotherhood Board having five commissions, *i.e.*, on foreign missions, ministry and home missions, Christian education, Christian service and finance. This action carried out a decision at the 1946 annual conference in Wenatchee, Wash. to increase unity, efficiency, and economy.

CONGREGATIONAL CHRISTIAN CHURCH

The proposed merger of the Congregational Christian Church with the Evangelical and Reformed Church was being discussed and votes taken throughout the United States in the fall of 1947, by congregations, district associations, and state conferences. The final vote will be taken April 1, 1948. The merger as proposed was the third in which the Congregational group had played a leading role in recent years and involved 700,000 members in the Evangelical and Reformed group, chiefly in Pennsylvania, Illinois, and Missouri. The Congregational Church, dating back to the *Mayflower* and beyond it, was joined by the Evangelical Protestant Church, a German-American group, in 1925, and by the Christian Church in 1931.

The total membership as of Jan. 1, 1947 in the Congregational Christian Church was 1,150,853, a rise of 20,029 over the previous year. The total number of churches was 5,783, a drop of 530. There were 145,633 members of young people's organizations in 3,321 parishes. Total benevolence contributions were $5,381,399, with 5,041 churches reporting. Total of invested funds by 1,930 churches was $34,593,156. Church school enrollments in 4,758 churches were 503,677, an increase of 9,548. There were 5,931 ministers, of whom 3,282 held pastorates. Home expenses reported by 4,969 churches came to $21,718,437, an increase of $2,417,316. The total value of property of the denomination as reported by 5,400 churches was $186,408,296. The American Board of Commissioners had an income of $1,538,402 for its fiscal year ended Aug. 31, 1946. Total income of all agencies was $7,392,771, and investments were $55,582,417. Reports from 1,925 churches listed a total of $31,225,000 additional investments.

DISCIPLES OF CHRIST

The Disciples of Christ reported, as of June 30, 1947, a total of 1,703,110 members in the United States and Canada and 1,838,397 members throughout the world. There were 7,844 churches in the United States and Canada and 8,713 in the world. Total receipts for the two North American countries was $10,376,544, compared with $9,941,052, the previous year. No figures were available for receipts outside North America for the year ended June 30, 1947.

The annual international convention, composed of delegates from the United States and Canada, was held in Buffalo, July 29 to Aug. 3, 1947, and followed by a five-day world convention, postponed from 1945, at which more than 7,000 delegates from 35 countries were reported in attendance. Resolutions adopted by the international delegates included a request to President Truman to grant an amnesty with restoration of civil rights to persons convicted of violation of the Selective Training and Service Act; that he "take immediate steps to discontinue the use by the armed forces of national defense funds for propaganda purposes and the use of military and civilian personnel in attempts to influence legislation and public opinion"; a reaffirmation of opposition to military training in peacetime; the urging of racial tolerance; condemnation of "any attempt on the part of any group, religious or otherwise, to lead us into a so-called 'holy war' against nations with whose political or economic philosophies we do not agree"; endorsement of the Stratton bill to permit entrance into the United States of 100,000 displaced persons a year for the next four years; a demand for separation of Church and State in the United States; the recall of Myron C. Taylor from the Vatican as representative of the President of the United States and the limiting of use of public funds for education to public schools without discrimination as to race or color; and the urging of a "renewed crusade" against use of alcoholic beverages through the initiating of a program of mass education, together with "enactment of such laws as are necessary to curb the avarice of the liquor industry."

The resolution against use of propaganda by the armed forces was introduced by a statement that "the subordination of the military establishment to civilian control is one of the basic constitutional principles of the Government of the United States." It declared "there are many ominous evidences that these safeguards are being ignored by the armed services and that these services are seeking to exercise undue influence over the political, economic, educational, and religious life of the nation, through the expenditure of huge and unreported amounts appropriated for national defense for propaganda purposes." Proposals for compulsory military conscription were also viewed as a contributory factor, along with use of military men in the administration of civil government at home and abroad. The plan of Secretary of State Marshall to provide economic aid to Europeans was endorsed, and the United States Government and governments of the world were urged "to make immediately available to the fullest extent of their abilities, food, clothing, shelter, medical care, and funds for the rehabilitation of national economies."

The World Convention, third to be held and which was scheduled for every five years, called for a United Christianity and "a spiritual quickening" to meet the challenge to "better and higher living" and resolved "that we make common cause with fellow-Christians the misgivings and depreciation we entertain toward governments, legislation, economic imperialism, and propaganda that seek the solution of international or interracial issues by unilaterial action or contemplated recourse to war." The World Convention adjourned until 1950.

PROTESTANT EPISCOPAL CHURCH

The Protestant Episcopal Church in 1947 devoted a great part of its efforts to securing materials for rebuilding churches in the Orient and in cooperating with other religious bodies in providing relief in Europe as well as the Far East. For this, the denomination began using a fund of more than $7,000,000 raised for rehabilitation and reconstruction of church properties destroyed in the Second World War. In addition, Presiding Bishop Henry Knox Sherrill who took over his duties as successor to Henry St. George Tucker early in January 1947, immediately began preparations for raising $1,000,000 a year in the next three years for his fund for world relief, disbursements from which were to go mostly through the World Council of Churches and the National Christian Councils in the Orient.

Missionaries were returning in 1947 to the Philippines and China conferences were initiated with leaders in Japan on plans for the future of Episcopal missions there. The number of missionaries returning to Japan, however, was limited, those who went being sent to assist native leaders in rebuilding church projects, a trend that had begun to take place before the Second World War. In Europe, former Suffragan Bishop J. I. Blair Larned of the Long Island Diocese U. S. A. took over a post as Bishop of the American Protestant Episcopal Churches in Europe, becoming a member of the World Council of Churches Reconstruction and Interchurch Aid Committee.

Documentary motion pictures made under the direction of a technical staff of the Department of Promotion of the Protestant Episcopal Church in Europe in 1946, were being shown in parishes and missions in the United States all through 1947. They showed various phases of relief work in Europe under the World Council of Churches. The films met with general approval and were released to Church

World Service and to other communions.

The acquisition of a large estate at Greenwich, Conn., for use as a permanent residence for the presiding bishop and as a conference center, was completed in 1947, and the National Council began holding its quarterly meetings there in the fall. The center became known as Seabury House, in honor of the first Bishop in America, Samuel Seabury, whose diocese was in Connecticut.

The National Council in April authorized a nationwide campaign of evangelism to start in 1948. The financing of this project was made part of a regular Every Member Canvass in the fall of 1947.

The House of Bishops, meeting in November in Winston-Salem, N. C., granted a request by a petition of the Philippine Independent Church that Episcopal bishops be permitted to confer the "gift of apostolic succession" on its episcopate. The Philippine Church, with some 2,000,000 baptized members and 35 bishops, comprised about 10 per cent of Christians in the Islands, and was reported to be the largest non-Roman Catholic communion there. The House of Bishops also decided to name a special committee to prepare and present at a future session a statement on the responsibilities of bishops in the administering of marriage canons which had been liberalized at the last triennial general convention of the Church in Philadelphia, in September 1946. Its committee on procedure under marriage legislation was directed to prepare any amendments needed to meet conditions revealed in the experience of administering the canons and have them ready for the consideration of the next Triennial General Convention, scheduled for the fall of 1949 in San Francisco.

The *Southern Churchman,* edited in Richmond, Va. in 1947, absorbed *The Chronicle,* an evangelical or "low church" periodical founded in 1901 and edited for 45 years by Alexander G. Cummings, rector of Christ Church, Poughkeepsie, N. Y., who died in September, 1946. The *Southern Churchman,* also a low church organ, was continued as the name.

EVANGELICAL AND REFORMED CHURCH

The triennial meeting of the general synod of this church was held July 9-16 in St. Louis, Mo. Reported by William E. Lampe, as secretary, was a total membership of 708,382 as of Dec. 31, 1946. There are 50,316 new members, but losses by death, transfer, and dropping cut it down to a net of 13,102. All synods, except one, had a net gain. The total gifts for benevolences was $3,915,321, a net gain of $740,000, nearly all for World Service. Giving for current expenses of congregations increased by more than $800,000, making a total of $8,856,306. Gifts for other congregational purposes, including debts, brought the total to $12,476,666, a gain of $1,236,005. The total giving for benevolences and congregational purposes in 1946 was $16,391,987, an average of $23.14 per member.

The value of church properties was $103,232,533, compared with a little less than $90,000,000 at the beginning of 1944. Church indebtedness, which had been $9,500,000 in 1941 and $6,000,000 in 1944, had been brought down, by the end of 1945, to $3,641,333. At the end of 1946, it stood at $2,936,036. Receipts for international missions were: $513,499, for the year ended Jan. 31, 1945; $507,628, 1946; and $576,869, 1947. Home missions receipts were: $472,323, year ended Jan. 31, 1945; $494,341, 1946; and $599,162, 1947.

Following consistent decreases in Sunday School enrollments for several years until it reached 414,382 in 1944, the number rose again in 1945 to 422,964, and in 1946 more than 10,000 were added, the new total being 433,410.

Among the actions taken at the triennial meeting of 1947 the general synod aligned itself with other Protestant denominations in protesting the appointment of Myron C. Taylor as representative of the President of the

United States to the Vatican "on the grounds that it violates the American principle of the separation of Church and State." The Federal Council of the Churches of Christ in America was urged to exercise its influence "to hasten" his recall.

Recommendations of the Commission on Christian Social Action concerning peace were adopted. Atomic energy, in order to benefit mankind, must be kept under public civilian control and should as speedily as possible be placed under a competent international atomic authority which will control its production and use, and enforce its suppression as a weapon of war.

All armaments should be brought under effective control by the United Nations as a step toward general disarmament, and the United States should cooperate to the fullest possible degree in transferring such international security and police powers as may be necessary to a small international force.

Compulsory military training and service should be outlawed by international agreement, and ought in no case be initiated unilaterally by the United States without a clear mandate from the United Nations.

Pacific islands and other territories which have come under the control of the United States should be placed under a trusteeship that is genuinely international, with full provision for international inspection at all times, and with administrative control in the hands of civilians.

Genuine international cooperation requires mutually advantageous economic cooperation and good faith, and as means towards these ends, the extension of reciprocal trade agreements with their provisions for conditional tariff reductions, and the support of an International Trade Organization.

Economic aid to needy nations should be granted by the United States in accordance with its great capacity to render such aid; however, such assistance should be extended within the framework of international agreement and under conditions which can be justified before the bar of world opinion as contributing to peace.

The Food and Agricultural Organization should be fully supported by the United States and encouraged to implement the principle of a world "ever normal granary."

The general synod also supported a guaranteed annual wage in principle to stabilize family life; disapproved any legislation which would reintroduce the use of injunction in labor disputes, limit collective bargaining to local units, or outlaw union security agreements; opposed indiscriminate infringement of the right to strike, and urged that, where it might be necessary to curb this right in the public interest, that workers be given corresponding protection to insure tenure of employment, adjustment of wages, and the redressing of grievances; and urged rural and urban members of the Evangelical and Reformed Church to study cooperatives and credit unions and, as need arose, to join consumers cooperatives.

FRIENDS

The American Friends Service Committee and the Friends Service Council of London and Dublin shared equally in 1947 in the Nobel Peace prize of 146,000 Swedish kroner or about $40,000. Dr. Henry L. Cadbury, chairman of the American committee, who received in Oslo, Norway, in December, the share awarded to his committee, spoke at the opening session of a meeting it held in New York before leaving. He emphasized the value of small groups working together to build international understanding. He put the responsibility for world peace partially on American policy. He said the committee had become concerned over the Russian situation and wanted to promote friendship with the Russians.

When the award was announced, it was learned that the American committee had administered $60,000,000 for charity in more than 20 devasted countries since the First World War.

For 300 years the Quakers had clung to the sturdy conviction that it was not right to kill, hating war, but giving energetically for works of mercy on battlefields in both World Wars, as well as in the interim in areas where sickness and need were found. Their ambulance corps and stretcher bearers were a familiar sight in the First World War. They provided medical relief in the Second World War, and in the days of reconstruction that followed continued to serve also by supplying food and clothing. In a year's operations in Hungary, it was reported that members of the American Friends Service Committee helped 5,000 students and industrial apprentices, thousands of children, workers on farms and in cities, old people and indigent middle class members. Dell Eberhardt of Berkeley, Calif., former member of a Quaker mission in Hungary, brought home reports of receiving cooperation of the Communist Minister of Welfare in Hungary.

In the United States, the Peace Section of the Committee reported, in 1947, 11 area offices manned by persons interested not only in peace education but in all projects of the service committee, which had been brought into being early in the First World War by representatives of the majority of the Yearly Meetings of the Religious Society of Friends in the United States. The impetus behind its formation had included the entry of the United States into that war. Its actual existence was preceded by sending financial contributions and ambulance workers to Europe to assist English Quakers who had reaffirmed their disbelief in war. Early in 1947 a new economic relations program was inaugurated in America and by the end of the year an economic relations committee had announced plans to bring together American representatives of labor, management, and government in conferences and institutes on mutual problems. The executive board of the American Friends Service Committee announced in 1946 a change in fiscal year, and, for the nine months ended Sept. 30, 1946, a total of $7,083,771 consolidated income was reported and total expenditures of $5,876,715. For the first fiscal year, ended Sept. 30, 1947, the total or consolidated income was $5,869,016 and expenditures $7,663,-193. The excess of expenditures over income was absorbed by a balance as of Sept. 30, 1946 of $3,083,976. The balance as of Sept. 30, 1947 was $1,289,800.

LUTHERAN

Delegates of Lutheran bodies from 30 countries on the five continents unanimously approved a constitution for the Lutheran World Convention at Lund, Sweden, in an assembly from June 30 to July 6, 1947, attended by more than 600 delegates and observers. The federation succeeded the Lutheran World Convention, organized in Eisenach, Germany in 1923. Convention meetings were held in Copenhagen, in 1928, and in Paris, in 1935, when a committee, headed by Abdel Ross Wentz, president of the Gettysburg, Pa. Theological Seminary, was appointed to prepare a draft of the constitution. A scheduled meeting of the convention in 1940 in the United States was canceled. The assembly in Lund, in organizing the federation, elected as its president Prof. Anders Nygren of Lund University, to succeed Archbishop Erling Eidem, Primate of the State Lutheran Church of Sweden. Among the Lutheran representatives at the gathering in 1947 in Lund were church leaders from occupied countries, churches in exile, in defeated countries, and mission areas. Fifty-five delegates and observers from all four zones in Germany attended. Most Lutheran churches in the federation had entered relations with the World Council of Churches in process of formation, which was to hold its first World Assembly in 1948.

The American Section of the Lutheran World Federation merged with the National Lutheran Council in the United States in September, 1947 in accordance with the constitution of the Lutheran World Federation adopted at Lund. The council, hitherto concerned with domestic problems, assumed the responsibilities of the former American Section which had dealt with international problems. The first official act of the council's executive committee was to set up an administrative board to handle emergencies between committee sessions. The Council became the national committee in the United States for the Lutheran Welfare Federation, and in a two-day session at the time of the merger with the American Section, approved allocations of funds for Lutheran World Action totaling more than $1,000,000.

Lutheran churches in the United States and Canada reported a total of 5,672,662 members at the end of 1946, an increase of 2.5 per cent over 1945, according to the annual statistical summary of the National Lutheran Council. Confirmed members totaled 3,941,121, a gain of 1.6 per cent as compared to an increase of 81,141 members in 1945 when the gain was 2.1 per cent. There were 16,241 churches, a rise of 83. The summary was based on statistics from 18 bodies covering all Lutherans in America. The highest numerical increase in 1946 as in 1945, was reported by the Missouri Lutheran Synod, which held its centennial convention in July, 1947, in Chicago, and had a gain of 47,541 baptized members, or 3.2 per cent. The Evangelical Lutheran Church reported the highest percentage increase, adding 6.1 per cent to its membership. The United Lutheran Church in America, largest of the bodies, reported a gain of 29,465 members, or 1.6 per cent. Losses were found in the Finnish Suomi Synod, which dropped 949 members and had a resulting total of 29,732, a 3.1 per cent loss, and in the Slovak Church, which decreased by 77 members to 9,367. Ordained ministers dropped by 188, totaling 14,200. During the year 1946, 154 parish schools were started, as compared to 819 in 1945, bringing the total to 24,283; their staffs were increased by 12,360 officers and teachers, bringing a new total of 297,174. They gained 16,949 pupils, the new total being 1,990,963. A heavy program of post-war building was indicated by the valuation of church property, which was raised by $44,912,718 to $475,935,415, and by an increase in indebtedness of $8,935,166 to $23,573,189.

The Lutheran churches in America in 1946 devoted $84,368,773 to local expenses and contributed $33,282,808 to church work at large, the total expenditures being $116,931,582, an increase of $12,684,791 in giving over 1945.

The executive board of the United Lutheran Church in America issued an appeal to its members in October, 1947 for strict conformance to food conserving in response to measures urged upon the United States by President Truman.

METHODISTS

The first ecumenical conference of Methodists in 16 years was held Sept. 24-Oct. 2, 1947, in Springfield, Mass., with 405 official representatives attending from 17 independent Methodist bodies. Plans were made to hold the next conference in 1951, in England, restoring the sessions to the normal decennial conference year, the 1941 conference having been postponed. The 1947 conference was the seventh such gathering. More than 50 addresses and reports were given in Springfield, Mass., though the findings had no legislative authority but were prepared as a message to more than 12,000,000 Methodists throughout the world.

Of these, the 1947 reports of the Methodist Church in the United States disclosed the total membership throughout the country to be 8,430,146, exclusive of 1,125,000 Negro Methodists belonging in three separate affiliates. There were also several smaller bodies. In addition to the membership in the Methodist Church in the United States, another 750,000 were listed abroad, in its missions. This larger body was sponsor of a rural life conference in Lincoln, Neb., July 29-31, 1947, attended by 2,100 country pastors, farmers, and church officials, at which the problems of rural communities were discussed. A youth conference was held Dec. 30, 1946 to Jan. 2, 1947, in Cleveland, O., attended by 10,000 young people and leaders, and reported to be the largest Methodist gathering in 100 years.

A total of $10,177,558 was appropriated for 1948-49 for missions at a meeting of the Board of Missions and Church Extension of the Methodist Church, in Buck Hill Falls, in December 1947. Of this, $3,857,359 was allocated to Foreign Missions for use in Europe, Asia, Africa, and South America; $2,048,535 to the Division of Home Missions and $4,271,664 to the Woman's Division of Christian Service, for domestic and overseas uses. This was the largest such appropriation in the history of the Methodist Church. The division urged pardoning of conscientious objectors by President Truman in a resolution drawn up and approved in Buck Hill Falls. "We believe that the time has now come for the mobilization of the Christian women of the whole world in a determined crusade for the prevention of war," another resolution by the women said. "We recommend that all Methodist women pledge themselves to a concerted effort to combat the talk of war, to halt the menacing cynicism, fear, and suspicion evident in our press and increasingly prevalent among our people. As a means of counteracting these disintegrating forces, we suggest: emphasis upon the accomplishments of the United Nations, as opposed to criticism of its progress; faith in the power of good will and cooperation instead of force in the settlement of international problems; study and exposure of propaganda whether in the press or in political action; cooperation with all efforts to comply with the pronouncements of the United Nations 'against false reporting and inciting a new war.' "

PRESBYTERIAN CHURCH, U. S. A.

The membership of the Presbyterian Church in the U. S. A., or Northern Presbyterians, rose from 2,174,530 to 2,234,798 as of March 31, 1947. The total contributions were $78,567,368, exceeding those of the previous year by $18,884,987, and breaking all previous records both in membership and contributions. The per capita giving was $36.15. The denomination changed its fiscal year to coincide with the calendar year and set itself to raise $17,444,231 for benevolences in 1948, a 50 per cent increase over the previous year's budget.

The Restoration Fund, a drive for which began June 1, 1945, had reached $23,830,624 by Christmas in 1947, on the way to a goal of $27,000,000 for post-war relief and rehabilitation. Among leading projects going forward was a drive for 1,000,000 new members and 300 new churches, together with the organizing of a National Council of Presbyterian Men. Lay representatives were scheduled to meet in Chicago, in February 1948, to draw up plans for this. The Covenant-First Presbyterian Church was dedicated in October, 1947 in Washington, D. C., as the National Presbyterian Church, following a decision reached at the 159th General Assembly in May. The Board of Christian Education initiated a new curriculum with the aim to spend more than $2,000,000 in the next few years, integrating home and parental interests with child education. Textbooks were decided upon to replace the familiar Sunday school quarterlies, leaflets, and other helps.

The Northern Presbyterians and Southern Presbyterians were represented at a two-day meeting in Rehoboth, Md., in October, bringing such representatives together for the first time since the Civil War, which caused a split in this as in other Protestant groups. Unity and efforts at reunion were promoted with more than eight years of negotiations behind the two groups who began studying a plan to reunite, with the expectation of completing the study in a year.

The principal difficulty holding up

proceedings had to do with property rights, only a few differences remaining, it was reported by Dr. William Barrow Pugh, Stated Clerk of the General Assembly of the Northern group, or Presbyterian Church in the U. S. A.

PRESBYTERIAN CHURCH, U. S.

The Southern Presbyterian Church, as the Presbyterian Church in the United States came to be known, which had 3,542 churches reported at its 87th General Assembly in May, 1947 at Montreat, N. C., a total of 613,701 members, exclusive of ministers, having 2,636 of the latter. A total of $26,061,129 was raised in contributions, an increase of $4,873,760, and a per capita of $42.81. Sunday school enrollment was 448,262.

Overtures at the May assembly meeting, seeking withdrawal from the Federal Council of the Churches of Christ in America, were returned to the Presbyteries for action and report at the 1948 session of the General Assembly, in Atlanta, Ga., in May. A five-year program of progress was authorized to expand the denomination's work through evangelism, with a minimum goal of 100,000 new members annually for the period. A goal of 1,250 chapels was set, 250 a year, and appropriations of a total of $7,850,000, apportioned to foreign missions, $4,000,000; home missions, $1,500,000; Christian Education, $750,000; religious education, $500,000; war relief, $600,000; training schools, $250,000; and Negro work, $250,000.

UNITED PRESBYTERIAN CHURCH

This Church reported, as of March 31, 1947, a total of 202,605 members. Congregational expenses were $5,308,212; benevolences, $2,133,430; funds used for all purposes, $7,696,863.

REFORMED CHURCH IN AMERICA

The number of congregations reported by this denomination in 1947 was 748; ministers, 901; total communicants, 178,318; enrollments in church schools, 130,142. A total of $1,795,741 was raised for benevolences, and $5,740,390 was raised for congregational expenses. Drafting of a proposed constitution, doctrinal statement, and forms of worship was being done in 1947, preparatory to the next move in a plan for merging the Reformed Church in America with the United Presbyterian Church. These were to be gone over early in 1948 for restatement and to be submitted to the General Synod of the Reformed Church and the General Assembly of the Presbyterians in May 1948.

SALVATION ARMY

Commissioner John J. Allan, who was appointed chief of staff of the International Salvation Army in September 1946, with his office in London, returned to New York in November 1947 for a month's stay, including a short trip to the West Indies, in December, for the sixtieth anniversary congress of the Salvation Army there. He said there were 100 Salvation Army officers in ten relief teams in western Europe, undertaking a needed post-war relief job. Eight children's homes were being maintained and one home for the aged. Distributions were being made of food and clothing and other necessities, special attention in food distribution being given to the aged. Major emphasis was being placed on rehabilitation of women and children and the restoration of family life.

The commissioner found different attitudes towards religion among Communist leaders in western Europe. He said the mayor of Prague, Czechoslovakia, a Communist, received him cordially and spoke well of the Salvation Army. He found no restrictions on religious liberty there, but it was not true in other cases. It depended upon individuals, he said. He found a resurgence of interest in religion in western Europe wherever he went, and that young people were attending Salvation Army services in large numbers.

The Salvation Army, in a survey of its work in the Second World War, found that, on 26 fronts, 115,761,055 persons had visited Salvation Army units, from Pearl Harbor Day, Dec. 7, 1941, to VJ-Day, Sept. 2, 1945. The organization had set up 4,000 canteens, service clubs, huts, and other units for men and women, and performed more than 225,000,000 services of various types for American and Allied personnel. Its distribution of articles included 50,613,804 envelopes and postcards and 3,209,842 pieces of literature. The clubs provided sleeping accommodations for 1,598,097 servicemen. Individuals receiving information numbered 8,842,834. Visits were made to 594,033 hospital patients, and home hospitality provided for 285,610 servicemen and their families. Personal and accommodation services totaled 21,936,520. The total program had the aid of 1,605,194 volunteers.

Throughout the world there were 17,915 corps and outposts of the Salvation Army as of Sept. 30, 1946, the reports in some territories being those of 1938, because of unsettled conditions. There were 1,700 social institutions and agencies, 985 day schools, and 27,811 officers and cadets. Personnel included 15,989 persons without rank; 104,324 local senior and young people's officers; 39,173 senior bandsmen; 89,352 singers; and 30,471 corps cadets. An even 100 periodicals were being published having an aggregate of 1,638,446 copies per issue.

Beds occupied during the year ended Sept. 30, 1946, so far as statistics were available, totaled 11,422,475, and meals supplied were 34,172,355. Men supplied with work numbered 65,445. Situations were found for 68,650 and only 232 went to inebriates' homes. There were 472 food depots which accommodated 41,941. There were 123 children's homes, accommodating 5,013, and 27 industrial and boarding schools, accommodating 2,735. In maternity homes were received 31,321 women. The army had 14 farms under supervision. A total affiliated membership reaching to 4,000,000 throughout the world was reported in 1947.

As numerous relief agencies settled down to the task of post-war reconstruction and rehabilitation, the Salvation Army was continuing, in the United States, its social service program, maintaining children's homes and hospitals, family welfare bureaus, employment bureaus, men's industrial institutions, youth centers, boys' clubs and summer camps, and its work in prisons.

CHRISTIAN SCIENCE CHURCH

The First Church of Christ, Scientist, Boston, Mass., and its branches throughout the world numbering more than 2,900, reported more than 30 tons of Christian Science books and periodicals had been given out in Germany as the result of a two-year drive. There were 100 college organizations.

The Mother Church in Boston began its relief program in 1941. It served Christian Science servicemen at military and naval training centers. Christian Science workers were assigned to nearly all Veterans Hospitals in the United States and Canada, in addition to Army and Navy hospitals. The story of its wartime activities appeared in book form early in 1947, and the period covered was from 1939-1946.

Second honorary mention went to the international daily, the *Christian Science Monitor,* for its encouragement of a better understanding among men of all creeds, races, and national origins, in the F. Wayland Ayer Exhibition of Newspaper Typography. A citation was also issued by the Institution for American Democracy, Inc., New York City. The translation of the textbook of Christian Science, *Science and Health with Key to the Scriptures,* by Mary Baker Eddy, into Spanish, was announced in 1947. Transcribed radio programs were broadcast over nearly 300 radio stations in the United States, including Alaska and Hawaii, in Cuba, Canada, New Zealand, and Australia. Other programs were also broadcast.

UNITARIANS

The Unitarian Service Committee had $1,500,000 as its 1947 goal for post-war relief. Total membership in 348 active churches was reported as 69,104. The United Unitarian Appeal for funds reached $223,509. Contributions for other philanthropic purposes came to $120,334. Current expenses ran to $2,605,355. The denomination used newspaper advertising at a cost of $36,560. The church year ended April 30, 1947. The denomination's 122d annual meeting was held in Boston May 22, 1947. Its resolutions covered upholding civil liberties including the right to political opinions in public and private life. The establishing of police and military forces for the United Nations and simultaneously the progressive disarmament of all member nations was urged. Opposition was raised to compulsory peacetime military training.

THE ROMAN CATHOLIC CHURCH

By Henry P. Lefebure
National Catholic Welfare Conference

STATISTICS

Membership in the Catholic Church in the United States in 1947 totaled 24,268,173, according to figures given by the official *Catholic Directory*. A record total of 18,754 Catholic parishes were in operation, with 13,819 of them having resident pastors. There were, in addition, 5,257 chapels and 4,935 mission churches.

There were 162 members of the American Hierarchy presiding over 101 dioceses and 22 archdioceses. These also include, for statistical purposes as American dioceses, the Vicariate-Apostolic of Alaska, the Abbatia Nullius of Belmont Abbey, N. C., and the Pittsburgh (Greek Rite) and the Ukranian Greek Catholic Dioceses. The number of ordained clergymen is 40,470, the highest on record. Among professed religious, the number of Sisters has increased to 140,563 and the number of Brothers to 6,938. The number of seminarians has increased to 23,135. A total of 100,628 converts entered the Church during the year. Infant baptisms numbered 738,314, and the total number of deaths was 258,588.

As the introduction and keynote of this account of the year's activity, there is given an excerpt from the report to the American Archbishops and Bishops by the Most Reverend John T. McNicholas, chairman of the Administrative Board of the National Catholic Welfare Conference, the central agency for the unification, coordination, and organization of Catholic activities in the United States. Archbishop McNicholas said that, as another year of the post-war period moved onward, the lines of cleavage between East and West became more sharply and, at the same time, more clearly drawn. Similarly, the people of our nation, and, indeed, of the world became daily more conscious of the basic issues at stake and more firmly entrenched in their alignment with respect to them. Totalitarian materialism emerged more plainly than ever before as the force engaged in a mortal struggle with western Christian civilization. Religion and the institutions of religion were in the very forefront, not only where the forces actually were at grips, as in certain areas of Europe and Asia, but wherever the philosophy of secularism was powerful enough to assert itself.

DECLARATION OF THE AMERICAN HIERARCHY

Nov. 12 to 14 were the dates of the Annual General Meeting of the Cardinals, Archbishops, and Bishops held at Catholic University and attended by 130 members of the hierarchy. At the close of the Meeting, the Bishops issued a statement entitled "Secularism" which was signed in their names by the Administrative Board of the N.C.W.C.

In what it called "perhaps the gravest crisis in all history," the statement appealed to all who believe in God to "make that belief practical in their workaday lives," to "look across the real differences which unfortunately divide them, to the common danger that threatens," to "refuse to let a common enemy capitalize on those differences to the detriment of social unity." If this were done, the statement added, "we might begin to see a way out of the chaos that impends."

Step by step, the Bishops considered the baneful influence of secularism upon life in its various aspects. They said:

> "Secularism, in its impact on the individual, blinds him to his responsibility to God . . . The greatest moral catastrophe of our age is the growing number of Christians who lack a sense of sin because personal responsibility to God is not a moving force in their lives.
>
> "Secularism has wrought havoc in the family . . . It has set the will and convenience of husband and wife in the place that Christian thought gives to the Will of God and the good of society.
>
> "In no field of social activity has secularism done more harm than in education . . . Our youth problems would not be so grave if the place of God in life were emphasized in the rearing of children. There would be less danger for the future of our democratic institutions if secularism were not deeply intrenched in much of our thinking on education."
>
> The Christian view of social order "lays the blame for instability in our social structure on human failure rather than on blind and incontrollable forces. It faces the plain fact that there is something gravely wrong in our economic life and sees in secularism, with its disregard of God and God's law, a potent factor in creating the moral atmosphere which has favored the growth of this evil.
>
> "In the international community there can be only one real bond of sane common action—the natural law which calls upon God, its Author—and derives from Him its sanctions . . . Men long for peace and order, but the world stands on the brink of chaos."

The statement admits that "Christians have often failed to meet their responsibilities and by their transgressions have permitted ugly growths to mar the institutions of their culture." "But," it adds, "wherever, despite their lapses, they have held steadfastly to their Christian ideals, the way to effective reform and progress has been kept open."

"In the dark days ahead," the statement concluded, "we dare not follow the secularist philosophy . . . We must be true to our historic Christian culture. If all who believe in God would make that belief practical in their workaday lives, if they would see to it that their children are definitely imbued with that belief and trained in the observance of God's way of life, if they would look across the real differences which unfortunately divide them, to the common danger that threatens, if they would steadfastly refuse to let a common enemy capitalize on the differences to the detriment of social unity, we might begin to see a way out of the chaos that impends."

COMMITTEE ON MOTION PICTURES

The report of the Committee on Motion Pictures to the General Meeting of the Bishops analyzed the annual report of the National Legion of Decency, noting the increased number of Class B films (objectionable in part) over previous years. Grave concern over the problem arising from the production of motion pictures based on immoral books was also expressed. The practice of making such pictures tends to promote the writing and increase the sale of immoral literature, thus constituting a menace to the moral standards of the American people.

CATHOLIC COMMITTEE FOR REFUGEES

In the course of the year's activities, the Catholic Committee for Refugees met many special problems in addition to its usual work of interviewing, aiding, guiding, and settling refugees coming or referred to it.

Considerable time and money were devoted to the problem of stowaways and other transients, who would have faced slave labor had they been returned to their country of origin. Sixty-nine persons in this category were aided, most of them being sent to South American countries.

Refugees who fled to Shanghai and who wished to emigrate to countries where some opportunity might await them or to return to their own countries were aided by the Shanghai Committee for Catholic Refugees. About half of them have been settled, and a number of them are expected to arrive in San Francisco soon.

Priests have been outfitted, orphans cared for, and a group of 231 Polish children settled in this country.

NEW ADMINISTRATIVE BOARD, N.C.W.C.

During the meeting the bishops chose the new Administrative Board, N.C.W.C. which subsequently organized as follows: Archbishop John T. McNicholas, O.P. of Cincinnati, chairman; Archbishop Richard J. Cushing of Boston, vice chairman of the Board and episcopal chairman of the N.C.W.C. Youth Department; Bishop John Mark Gannon of Erie, treasurer; Bishop John F. Noll of Fort Wayne, secretary; Archbishop Robert E. Lucey of San Antonio, episcopal chairman of the Department of Lay Organizations; Archbishop Joseph E. Ritter of St. Louis, episcopal chairman of the Department of Catholic Action Study; Archbishop James H. Ryan of Omaha, episcopal chairman of the Department of Education; Bishop Karl J. Alter of Toledo, episcopal chairman of the Department of Social Action; Bishop Emmet M. Walsh of Charleston, episcopal chairman of the Legal Department; Bishop Michael J. Ready of Columbus, episcopal chairman of the Press Department.

The general meeting voted unanimously to conduct the Bishops Emergency and Relief collection again in 1948, on Laetare Sunday where this is practical. It also voted to make the work of the Cana Conference a special activity and interest of the Family Life Bureau, N.C.W.C. The appointment by the Administrative Board of a special committee of Bishops to represent the N.C.W.C. in problems relating to the Church in the occupied areas in the Pacific was authorized.

WAR RELIEF SERVICES—N.C.W.C.

From funds derived from the Bishop's Relief Campaign for Victims of War and the National War Fund, as well as from the proceeds of its various gifts-in-kind campaigns conducted during the past fiscal year, War Relief Services—N.C.W.C. was able to forward to the war-devastated countries during the year a total of 25,266,197 pounds of food, clothing, and medicine which had an approximate value of $11,165,867.04. These contributions brought the total amount of relief that has been extended through War Relief Services—N.C.W.C. from various sources, since its inauguration in 1943, to the grand total of approximately 142,241,000 pounds of supplies which had a total value of more than $107,350,000.

Austria, Germany, Hungary, Italy, Poland, and Rumania continued to be areas of most critical need in Europe, and the recipients of a large share of the relief that was forwarded abroad by this Catholic agency. Conditions in the Far East were almost as critical as those of Europe, and there were thousands of war victims in China, Japan, Korea and the Philippines who were dependent upon the charity of the Church. The Catholic agencies of these countries were supplied also with food, clothing, and medicine, particularly for programs for children.

Six major campaigns for funds and gifts-in-kind were conducted: the Bishops' Relief Campaign for Victims of War which began on Laetare Sunday, March 16, 1947, and which realized over $7,500,000 for foreign relief purposes; the Clothe the War Stricken Campaign in which 3,640,000 pounds of clothing were gathered, a campaign for Clothing for the Religious and Clergy of Europe and the Far East taken up principally among the Catholic clergy of the United States; the continuing Children in Need Campaign of the National Council of Catholic Women which has now reached a total of approximately 750,000 pounds of children's and infants' clothing; a special campaign conducted by the Council for soap and towels which gathered 30,000 pounds of these invaluable articles; and a special family assistance campaign which is being conducted by the Catholic Daughters of America.

The food collection taken up in 115 dioceses throughout the country during Thanksgiving week, with a goal of 25,000,000 cans, actually succeeded in collecting more than 60,000,000 pounds of food.

During this period, War Relief Services—N.C.W.C. also continued to lend aid and assistance to the Displaced Persons in the camps in Germany, Austria, Italy, and other areas, and began a program of cooperation with the Vatican Migration Bureau, established by the Secretariat of State of the Vatican, looking toward the solution of this most perplexing problem through plans for resettlement.

THE NATIONAL CATHOLIC COMMUNITY SERVICE

The National Catholic Community Service, member agency of the United Service Organizations, Inc., will continue its welfare program for the nation's peacetime defense forces after the dissolution of USO in December, 1947. Objectives of the peacetime NCCS program have been outlined as follows: (1) to serve the spiritual, educational, recreational, and social needs of our peace defense forces; (2) to coordinate and stimulate work of local Catholic groups in providing service to Veterans Hospitals.

While the major resources of the future NCCS program will be devoted to the welfare of the defense forces, the Bishops have also authorized NCCS "to offer advisory and consultative service on a limited basis to dioceses requesting assistance in organization and development of Catholic Community Service programs for civilians, with particular reference to Catholic Community Centers and adult leisure-time recreational programs."

CATHOLIC EDUCATION

Enrollment in American Catholic schools, according to N.C.W.C. Department of Education figures, was as follows: Elementary, 2,147,311, a gain of 2.9 per cent in a year's period, which "conforms to the increased birth rate of the latter 30's and early 40's; Secondary, 443,004, a year's gain of 5.3 per cent; College, 231,845," a remarkable increase "beyond the peak enrollment of 161,886 in 1940." The gain partly accounted for by the enrollment of veterans is in keeping with the upswing in all colleges and universities in the United States. The United States Office of Education has estimated that there are enrolled in these institutions, 2,100,000 that, by the fall of 1948 the figure will be 2,700,000, and that 1950 will see 3,300,000 in these schools. These figures include all post-high-school education and not merely colleges of liberal arts and sciences.

THE CATHOLIC PRESS

The N.C.W.C. News Service, serving the Catholic Press, stated that events of Catholic importance and interest in a quantity and diversity never before equalled in the history of the Service were reported during the year.

"The deadly earnest struggle of the West against atheistic communism" was widely manifest, and "along with this, there came ever-widening and ruthless assaults on religion," the Catholic Church often being singled out to bear the brunt of this persecution.

"A sharply different type of reporting became essential" to meet the challenges of the new year. More careful analysis with background material was needed to present and clarify confusing issues, and more on-the-spot probing to keep pace with swiftly moving events.

SOCIAL ACTION

Highlights in the field of social action were the Family Life Conference and the pledge of renewal of the marriage promises at a Holy Hour in 40 dioceses at the same time; special work on atomic energy; special work with international Catholic organizations; decision to inaugurate economic conferences on Negro problems through the Catholic Conference on Industrial Problems; preparation and publication of material on Communism; and special work with business representatives and personnel men.

The N.C.W.C. Social Action Department issued recommendations calling for the following: "1. A group of priests in each diocese working together under a director (wherever possible formally appointed by the Bishop) to make Catholic social teaching known; 2. A group of laymen and laywomen around them who know or want to know Catholic social teaching and be apostles for it; 3. Development of a program of education in the diocese in schools, youth organizations, adult organizations, and the press; 4. Diocesan organization of men, women and youth so as to facilitate a program of education in Catholic Social Teaching."

LAYMEN'S ACTIVITY

Affiliated men's societies of the National Council of Catholic Men increased from 2,954 to 3,130.

Among radio activities, June 22, 1947 marked the 900th consecutive broadcast of the Catholic Hour. Currently carried by 113 stations of the National Broadcasting Company, the Catholic Hour received again in 1947 a citation from the Institute for Education by Radio, for its "superior presentation of religious thought accompanied by the best of liturgical music." The younger Hour of Faith, broadcast over 55 stations of the American Broadcasting Company, brought in many commendatory letters. In October 1946, the N.C.C.M. undertook the production of the Catholic program on the Mutual Broadcasting System's religious series, entitled Faith in Our Time, carried over 77 network stations.

An important part of the N.C.C.M. program is the distribution of literature requested mainly by listeners to its three programs. Almost 500,000 descriptive radio circulars were mailed out and thousands of printed radio talks were distributed upon request.

In September 1947, the Council played a prominent part in the Catholic Tri-State Congress in Grand Rapids, Mich. The five-day Congress was described in many circles as one of the most significant lay undertakings in the field of Catholic action.

CATHOLIC WOMEN

The National Council of Catholic Women enjoyed a steady growth in affiliations, 136 over the previous year. The Council now lists 75 Diocesan Councils, with Dallas organized as the 76th in September 1947. Eighteen national organizations of women are affiliated, seven state organizations, and a total of 4,709 local organizations, of which over 100 are in dioceses where diocesan councils are not yet established.

The year 1947 saw the transfer of the National Catholic School of Social Service, for 27 years a national project entrusted to the N.C.C.W. by the Bishops, to the Catholic University. The N.C.C.W. Board has urged its affiliates, however, to continue their interest in directing young women to the career of social service and to the obtaining of such training under Catholic auspices.

The biennial convention in Kansas City demonstrated the growth of the Council, with 1,300 women attending, among them voting delegates from affiliated organizations from 31 states and 67 dioceses, the largest number (581) in the history of N.C.C.W. conventions.

YOUTH WORK

National Youth Work, as centered in the N.C.W.C. Youth Department, was concerned with exchanging information useful and necessary for the proper functioning of diocesan programs and other groups interested in the Catholic Youth Apostolate.

In March, 1947, the N.C.W.C. Youth Department surveyed the situation of diocesan youth work in this country. From 76 dioceses answering, it was found that 64 have diocesan youth programs. Of 423 persons in diocesan youth work, 261 are priests and 162 professional lay workers.

A National Conference on Catholic Youth Work, called by the Episcopal Chairman, met in Cleveland, May 19-21, 1947. Six hundred persons attended. The program, under the title Unity in the Youth Apostolate, was designed to clarify purposes and contribute toward better coordination on diocesan and national levels.

The National Catholic Youth Council has been approved as the national federating machinery for Catholic youth groups in the United States. The March survey revealed that 16 dioceses have Diocesan Youth Councils, with Councils being formed in nine others. Five dioceses reported inactive or discontinued Councils.

During 1947, the Department gave high priority to supervising and promoting the two national student federations comprising the College and University Section of NCYC. Mainly, this activity was based on certain currents in national and international student life. The present active condition of the Newman Club Federation, with 310 clubs affiliated, and the National Federation of Catholic College students, with 147 member colleges, is due partly to increased student activities outside the Catholic sphere.

THE CONFRATERNITY OF CHRISTIAN DOCTRINE

During the year, diocesan directors were appointed for Columbus, Pueblo, and the recently erected dioceses of Evansville and Lafayette, Ind., and Madison, Wis., bringing the total to 118. Assistant directors were appointed in 13 archdioceses and dioceses. At the 11th Annual Meeting of Directors, held in conjunction with the Eighth National Congress, it was pointed out that more emphasis must be given to spiritual motivation.

At Catholic University, persons experienced in Confraternity work conducted a six-week summer school session with academic credit, providing intensive training for Confraternity activity through workshops, and classes. The enrollment totalled 106 priests, sisters, seminarians, lay men and women from 32 dioceses of the United States, Canada, and South America.

In January 1947, Rev. Cyrilo Elton, SS.CC. of the Catholic Universities of Santiago, Chile, and Lima, Peru, joined the staff to establish contact with the catechetical centers of Central and South America. The first two numbers of a bi-annual Confraternity Bulletin in Spanish were sent to hierarchy, clergy, and laity of Central and South America as well as to Latin-American students attending colleges and universities in the United States.

OTHER EVENTS

A notable Declaration of Human Rights for the person, family, and State, both as a domestic and an international community, subsequently widely praised, was prepared by a committee of philosophers and jurists at the request of the National Catholic Welfare Conference, Washington, D. C., and forwarded to the United Nations.

February was highlighted by the U. S. visit of Cardinal Konrad von Preysing, Berlin Bishop. His six-week tour covered the nation. Guest of U. S. Hierarchy, he came to thank Americans for their generosity to war-impoverished Germany. He visited 15 major cities; was feted by three Cardinals, 11 Archbishops, 40 Bishops; met thousands of clergy and hundreds of thousands of laity.

At this time also the U. S. Supreme Court upheld New Jersey's school bus law permitting non-public school children to ride in public buses.

During the month of March, when he marked his 71st birthday and eighth anniversary of his election and coronation, Pope Pius XII was singled out by Sweden's King Gustav V as the man who rendered greater service to humanity than anyone else in the world and awarded the nation's Prince Carl Medal.

Cardinal Eugene Tisserant, secretary of the Sacred Congregation for the Oriental Church, who arrived in April on an extended U. S.-Canada visit, disclosed that millions of Eastern Rite Catholics were "suffering in new catacombs." In Moscow, G. R. Brunst of N.C.W.C. News Service headquarters staff, reporting the Big Four Foreign Ministers' Conference, became the first correspondent exclusively representing a religious news service to report events within Soviet Russia.

The U. S. Hierarchy lost a distinguished member and gained six new ones during May. Archbishop Michael J. Curley, 67, first U. S. prelate to head two archdioceses—Baltimore and Washington — simultaneously, died after a long illness in Baltimore. Bishop Floyd L. Begin was consecrated Auxiliary of Cleveland, and Bishop Thomas J. McDonough, Auxiliary of St. Augustine. Meanwhile Pope Pius XII named Msgr. John J. Wright, Auxiliary Bishop of Boston; Msgr. John P. Cody, Auxiliary of St. Louis; the Rev. James J. Byrne, Auxiliary of St. Paul, and the Rev. Henry T. Klonowski, Auxiliary of Scranton. Bishop William T. McCarty, C.SS.R., was installed as Coadjutor at Rapid City.

As the month of May opened, huge ceremonies were held throughout the nation at which prayers were offered for conversion of Russia. On Mother's Day a nationwide collection was taken up for funds to complete the National Shrine of the Immaculate Conception in Washington.

August brought an exchange of letters between Pope Pius XII and President Truman. The President pledged again his desire to work for peace "built only on Christian principles."

Yugoslavia's tense situation again was spotlighted. Hardly had reports of killings of several priests, death sentences and long prison terms for seven others reached the U. S., than a group of eight Protestants, including seven clergymen, returned from a whirlwind visit to Tito-land. They reported no evidence of religious persecutions, even in the case of imprisoned Archbishop Aloysius Stepinac of Zagreb. The report, generally, was characterized by religious leaders and the secular press as a "whitewash" for Tito.

Two gigantic U. S. assemblages attracted attention of the Catholic world in September. The colorful, four-day spectacle that was the Eucharistic Congress marking the Buffalo diocese's centenary, brought together seven Cardinals, upwards of 70 Archbishops and Bishops from all parts of the world, and more than 100,000 faithful. The Tri-State Congress in Grand Rapids, arranged by the N.C.W.C. Lay Organizations Department, drew 20,000 persons at 50 discussion meetings, and was hailed by Cardinal Edward Mooney, Archbishop of Detroit, as the first in a series of such efforts to advance Catholic aims through an informed laity.

Passing of two eminent prelates shrouded the Catholic world during October. In Rome, Cardinal Carlo Salotti, prefect of the Congregation of Rites, died at 77 after a distinguished career of service to the Church. His death reduced the College of Cardinals to 62. Beloved Archbishop John J. Cantwell, pioneer for clean movies and spiritual head of Los Angeles Catholics since 1917, died in Los Angeles at 72.

As the year slipped from the calendar into history, Pope Pius named Providence's Bishop Francis P. Keough to be Archbishop of Baltimore; Msgr. Patrick A. O'Boyle, director of New York charities and former director of War Relief Services—N.C.W.C., first Archbishop of Washington; Msgr. Albert R. Zuroweste, editor of *The Messenger*, Bishop of Belleville; Msgr. Louis J. Reicher, first Bishop of the newly created Diocese of Austin, Tex., and Msgr. Wendelin J. Nold, Coadjutor with right of succession to Bishop Christopher E. Byrne of Galveston.

THE EASTERN CHURCHES

By E. R. Hardy, Jr.

Berkeley Divinity School

GREEK (HELLENIC) ORTHODOX CHURCH

The latest figures for the Greek Orthodox Church in America report 277 communities, nearly all served by resident priests. The membership of the Clergy Mutual Aid Fund comprises the archbishop, three assistant bishops, and 176 priests. The Nov. 15 number of the *Orthodox Observer*, official Greek-language magazine of the Archdiocese, contained a description and pictures of the archdiocesan institutions—the headquarters at New York and Chicago, the Holy Cross Seminary at Pomfret, Conn. and Brookline, Mass., and the Academy of St. Basil at Garrison, N. Y. The latter is an institute for training young women as religious teachers, with which a day school is connected. The Seminary celebrated its tenth anniversary in 1947; it has already contributed over 50 priests to the Church.

The Greek Church is constantly occupied in organizing the scattered Greek communities; early in the year the Archbishop's assistant, Bishop Germanos of Nyssa, carried out a visitation of the South for this purpose. Conferences of the teachers in Greek religious schools were held in the principal districts. On June 27-29 the choirs of the Greek Churches of California held a convention and organized a choral society.

Several special events of interest took place during 1947. On Jan. 11 Archbishop Athenagoras, on behalf of the Patriarch of Jerusalem, presented the Grand Cross of the Holy Sepulchre to President Truman. On April 2, memorial services for King George II of Greece were held in the Cathedral in New York and elsewhere. From April 25 to May 10, Archbishop Germanos of Thyateira was in the United States in connection with the meeting of the Provisional Committee of the World Council of Churches, of which he is one of the presidents. Since 1922 he has been Exarch of the Patriarch of Constantinople for Western Europe: previously he had been head of the Patriarchal Seminary at Halki, where he taught several of the leaders of the Greek Church who were glad to welcome him to this country. On Sept. 21 a religious and patriotic festival in connection with Holy Cross Day (Sept. 14) was held at Atlantic City with an attendance of some 21,000. The Archbishop, the Bishop of Nyssa, and Bishop Bohdan of the Ukrainian Church took part in the Liturgy and the traditional blessing of the sea with the Holy Cross, with prayers for the American Navy, protector of peace and freedom.

A lay organization, Zealots of Orthodoxy, has undertaken the publication in English of the works of Apostolos Makrakis, a Greek lay theologian who died in 1905. A vigorous defender of the Orthodox faith and an equally vigorous proponent of reform in the Church, Makrakis was officially censured in his own time but has inspired much of the new life of today in the Orthodox Church, and these publications have received ecclesiastical approval.

RUSSIAN ORTHODOX CHURCH

In accordance with the decisions of the Cleveland Sobor of 1946, the Russian Church in America has broken administrative connection with the Synod of Russian Bishops in Exile. As a result Archbishop Vitaly of Jersey City and three other Bishops withdrew from union with the American Church early in 1947, carrying with them a few parishes. On March 30, Metropolitan Theophilus consecrated Archimandrite Antony, for many years rector of the Church of SS. Peter and Paul, Montreal, as Bishop of Montreal and Eastern Canada, and on April 6 the Archimandrite John as Bishop of Brooklyn and his assistant in New York.

On July 18, Metropolitan Gregory of Leningrad arrived in New York to reopen negotiations for the resumption of normal relations between the Patriarchate of Moscow and the Russian Church in America. The American Church, however, desired complete internal autonomy under the spiritual leadership of the Patriarch. Metropolitan Theophilus was represented in the negotiations by Bishops Antony and John. Since the Patriarchate insisted on retaining some control over the administration of the Church in America the negotiations remain incomplete, and Metropolitan Gregory has returned to Russia. The former Patriarchal Exarch, Metropolitan Benjamin, has been transferred to the Diocese of Riga, and the Patriarchate is temporarily represented by Archbishop Makary of New York. Bishop Antony of Montreal, having recently died, the hierarchy under Metropolitan Theophilus consists of Archbishop Leonty of Chicago, Bishop Benjamin of Pittsburgh (temporarily in charge of the Orthodox Church in Japan), Bishop John of Alaska, Bishop John of Brooklyn, and Bishop Nikon, formerly of Paris, now at the Monastery at South Canaan, Pa. The Council of Bishops met at San Francisco in November for a four-day session in which it made arrangements for filling up its numbers and returned to the previous status of provisional autonomy. Further negotiations with Moscow are not immediately expected.

The Russian Orthodox Church now ministers to its people in some 350 communities, the larger number of parishes remaining in Metropolitan Theophilus' jurisdiction; the greatest concentration of parishes is in Pennsylvania, which has about 80. St. Vladimir's Seminary is now established in the buildings of Union Theological Seminary, New York, and operates in cooperation with Columbia University. Its staff has recently been strengthened by the arrival of several distinguished Russian scholars from abroad, including G. P. Fedotov and Nicholas Lossky.

OTHER ORTHODOX CHURCHES

Bishop Policarp of the Romanian Church has been unable to return to the United States, and the administration of the diocese is therefore still in the hands of a committee. Metropolitan Vissarion, formerly of Cernauti, is expected to arrive shortly as spiritual head of the Church in the United States.

The Serbian Church under Bishop Dionisie completed in 1947 the celebration of the 600th anniversary of the institution of the Serbian Patriarchate in 1346 under St. Joannikie. Most of the Serbian Orthodox in this country are not sympathetic with the government of Marshal Tito in Yugoslavia, although ecclesiastically under the jurisdiction of the Serbian Synod and Patriarch Gavrilo in Belgrade. Divisions based on this situation have led to the separation of the Serbian parish in Pittsburgh from the rest of the Church in America.

The Syrian Church under Metropolitan Antony is making arrangements for the publication of an official magazine in English, which language it already employs extensively in its services.

ORTHODOX CHURCHES ABROAD

During most of the year the Patriarch of Constantinople was in retirement on account of his health, but he is now returning to his duties. In March, the Synod of Constantinople formally recognized Metropolitan Vladimir as successor to the late Metropolitan Eulogie as Exarch for the Russians of its jurisdiction in western Europe. Other Russians in western Europe are under the Patriarch of Moscow, while a number of parishes, including many of those organized in the Displaced Persons' camps in Germany, recognize the authority of the Synod of Russian Bishops in Exile, now at Munich. In Russia the Church has continued to expand its theological education and rebuild parochial and monastic life; the shortage of educated clergy and of qualified candidates for the episcopate is at present the chief limitation on its revival. Invitations were issued by Patriarch Alexei for a conference at Moscow in October to discuss common problems of the Orthodox Church and its relations with other Churches, but on account of a refusal from Constantinople and some hesitation elsewhere the conference has been postponed.

In February, a Delegation from the World Council of Churches visited the Orthodox Churches of the Near East to renew contacts and reaffirm the invitation to take part in the coming Assembly of the World Council. Favorable replies have been received from all the Orthodox Churches of that area—the Patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem, and the autocephalous Churches of Cyprus and Greece. Several Orthodox theologians have taken a prominent part in the work of the World Council; Archbishop Germanos is one of its presidents, Father Florovsky of Paris also attended the meeting of the Provisional Committee at Buck Hill Falls in April, and both Greek and Slavic writers are sharing in the study program of the Council. The World Council is also in touch with the Coptic and Armenian Churches. Its relief program has extended to several Orthodox Churches, cooperating especially with the Church of Greece, the Patriarchate of Romania, and the Orthodox Church in Finland.

The long vacancy in the Church of Cyprus was terminated by the election of Bishop Leontios of Paphos as Archbishop on June 20. Born in 1896, Archbishop Leontios was a graduate of the University of Athens and the General Theological Seminary, New York, a member of the Orthodox Delegation at the Lambeth Conference of the Anglican Communion in 1930, and Bishop of Paphos since June 1947. Unfortunately his premature death on July 26 renewed the vacancy in the see, of which the one surviving Bishop, Makarios of Kyrenia, is now *locum tenens*.

OTHER EASTERN CHURCHES

Mar Shimun, Patriarch of the East and of the Assyrians, continues to devote himself to the building up of the Assyrian parishes in the United States; besides a few in the East and at Chicago the main center is in California. With the cooperation of the (Episcopal) Bishop of San Joaquin, Mar Shimun organized in October a numerously signed protest of prominent Americans against the oppression of Assyrians in Iraq.

Bishop Tiran of the Armenian Church has started a drive for the building of an Armenian Cathedral and cultural center in New York, where at present he occupies temporary headquarters. A certain number of Armenians from America have joined in the movement for the return of unsettled Armenians to Soviet Armenia, which occupies the traditional center of their homeland. The Armenian parishes in California, which form a separate prelacy, are now under the jurisdiction of Bishop Kasparian.

JUDAISM AND JEWISH COMMUNAL AFFAIRS

By Harry Schneiderman
Co-Editor, American Jewish Year Book

GENERAL

The American Jewish community devoted its attention and resources during the year 1947 to problems of strengthening American communal needs, overseas relief, the requirements of Palestine reconstruction and settlement, and refugee aid.

The creation of the Jewish state Nov. 29 by the United Nations was for many American Zionists the realization of long years of hope and work. Non-Zionist Jews also welcomed the United Nations decision, but continued to urge the lowering of immigration barriers in all lands. All Jewish groups, faced with the fact that upon the United States has fallen the mantle of a Jewish cultural center, have turned to self-examination and a re-evaluation of their educational, social, and welfare needs. At the same time American Jews continued their efforts to overcome anti-Jewish agitation and prejudice.

SYNAGOGUE ACTIVITIES

The growing social awareness of religious bodies, in response to the economic and social tensions which brought on the Second World War and which remain unallayed since the war's end, is perhaps the most significant development in current religious thought and action.

The Jewish Orthodox rabbinate, organized in the Rabbinical Council of America, for the first time in the history of Orthodoxy issued an official pronouncement on American economic problems at its convention in April. The Council identified the labor-management relations problem as the most crucial facing the American community and urged management to accord the laborer full recognition as a "human being endowed with incalculable spiritual potentialities. . . ."

On the occasion of Race Relations Week in February the Central Conference of American Rabbis, the association of Reform rabbis, denounced race-hatred as "blasphemy" and urged the removal of all barriers, by legislative as well as educational and economic means, to the "achievement of one humanity under God." In April, the Central Conference sponsored an Institute on Judaism, Management, and Labor in Chicago, attended by laymen, rabbis, and leaders in industry and labor. A summary resolution passed by the Institute deplored all legislation which would deprive labor of any of the rights gained since passage of the Wagner Act.

At its 58th annual convention held in June the Central Conference considered and passed resolutions on labor, immigration, the United Nations, public education, civil rights, discrimination, and intermarriage. The convention urged free immigration into Palestine, passage of the Stratton Bill to admit displaced Europeans into the United States, enactment of a Federal Fair Employment Practices Commission and anti-lynching legislation. In regard to mixed marriages, the Central Conference reaffirmed its resolution of 1909 declaring that mixed marriages "are contrary to the tradition of the Jewish religion and should therefore be discouraged by the American Rabbinate."

OPPOSITION TO SECTARIAN PRACTICES IN PUBLIC SCHOOLS

The efforts of various church groups to introduce sectarian practices and instruction in the public school system, which have increasingly concerned Jewish religious bodies in recent years, finally prompted the adoption of a clear-cut policy. In June, the Central Conference voiced its opposition to the use of public school assemblies and convocations for evangelistic purposes. In the fall, the Synagogue Council, representing Reform, Conservative, and Orthodox congregations, and the National Community Relations Advisory Council called a conference of their member organizations to consider specifically the attitude of the Jewish community toward the so-called "released time" plan which has been adopted by a steadily increasing number of cities. As a result of the discussion, both organizations, with the approval of all their member organizations, issued a joint declaration in May in which they stated unequivocally that religious instruction is the responsibility of the synagogue, church, and home, not of the public school. These organizations, therefore, announced their opposition to released time and dismissed time practices in the public schools and to the utilization of time, facilities, personnel, or funds of the public school system for religious instruction. However, the statement pointed out, where a program of released time or dismissed time is already in effect or may be adopted, a number of safeguards against possible abuses must be insisted upon. The two organizations set up a permanent national committee to consult with local Jewish communities on problems arising from the introduction or operation of released-time.

STRENGTHENING ADHERENCE TO JUDAISM

The 1947 Conference of the Jewish Theological Seminary of America, held in November, was devoted to the preparation of a program designed to intensify Jewish adherence to Judaism and to advance understanding among all Americans of the Jewish faith. Sponsored jointly by the United Synagogue of America and the Rabbinical Assembly of America, the Conference adopted a plan for strengthening interfaith cooperation in America by meeting the increasing need for adequately trained Jewish leadership through the enlarged schools of the Seminary; enriching Jewish life by restoring the synagogue as the center of the Jewish community; advancing the Jewish education of children and adults; and fostering American understanding of Jews and Judaism through the Seminary's educational program.

The Seminary has sponsored as part of its educational program the "Eternal Light" radio broadcasts, the Institute for Religious and Social Studies, the Jewish Museum which houses a collection of Jewish art and ceremonial objects, and the Seminary Library.

The Union of American Hebrew Congregations set aside November and December 1947 and January 1948 as a period during which 50 Reform rabbis will visit 37 states in a program of religious revival. The American Jewish Cavalcade, as this program is known, hopes to carry knowledge and understanding of Judaism to all Americans who wish to labor with Jews for the spiritual and material betterment of mankind.

Efforts of religious leaders to reach out into small communities throughout the country were demonstrated by the celebration of an Agricultural Sabbath on Oct. 4, the Sabbath of Succoth, traditional Jewish Thanksgiving week. The Synagogue Council of America, in cooperation with the Jewish Agricultural Society of America, sponsored the celebration which included the preaching of sermons on farm life and its importance to Jews.

ORGANIZATION ACTIVITIES

In addition to acting on social questions, synagogue and rabbinical organizations have pursued their regular program of activities during the year.

The Rabbinical Council of America followed the example set by its Conservative and Reform counterparts and adopted a pension and health insurance plan for its members. Rabbi Uri Miller of Baltimore served as president during the year; Rabbi Morris Max was engaged as executive vice-president.

The Union of Orthodox Jewish Congregations began publication of a bi-monthly magazine, *Jewish Life,* under the editorship of Leo S. Hilsenrad. It established a national association of men's clubs and an organization of junior congregations affiliated with its member synagogues. Both groups issue monthly publications.

The Union of Sephardic Congregations, under the leadership of Dr. David de Sola Pool, continued to lend guidance to Sephardic communities throughout the world and to provide prayer books and other ritual and educational materials for their use.

The Rabbinical Assembly, in conjunction with the United Synagogue of America, is preparing two volumes of prayer books for daily and home use and for the High Holy Days.

A conference on Jewish music in the synagogue, held in February, resulted in the establishment of the Cantors Assembly. Both the United Synagogue and the Union of American Hebrew Congregations set up architectural bureaus and consulting staff to guide congregations planning new buildings.

Rabbi Maurice N. Eisendrath was elected to the presidency of the Union of American Hebrew Congregations to succeed the late Adolph S. Rosenberg. The Union sponsored 67 Institutes on Judaism for the Christian clergy during the year and the National Federation of Temple Sisterhoods inaugurated a similar series of institutes for leaders of church women's groups. The Sisterhoods also embarked on a campaign to erect a headquarters building for the Union and its affiliates.

Under the auspices of the National Federation of Temple Brotherhoods, the Jewish Chautauqua Society sponsored lectures on various aspects of Judaism at 366 colleges and distributed close to 7,000 books among college libraries. The Union also announced the establishment of the Frieder award which will provide prizes of $1,500 annually for the best productions dealing with Jewish life in drama, poetry, and fiction. The National Federation of Temple Youth, which had been weakened during the war years, engaged in energetic organization efforts under the new director, Rabbi Samuel Cook.

At the death of Rabbi Isaac Landman, Rabbi William Rosenblum was elected head of the Synagogue Council of America.

EDUCATIONAL ACTIVITIES

Jewish educational endeavor during the year was characterized principally by an awareness of the need for intensifying Jewish education on the elementary level. This was reflected in the education conferences of the Rabbinical Assembly in December and the Mizrachi National Education Committee in April.

Changes in elementary Jewish education have already appeared in the schools of many cities. These changes include improved curricula, additional kindergarten or pre-school departments, supplementary week-day instruction added to existing Sunday School programs, increased sessions in week-day schools, and summer day camps.

Jewish educational objectives were the subject of a joint conference in June of the National Council for Jewish Education and the American Association for Jewish Education which set up a commission to make an intensive survey of the Jewish teaching field as a prelude to raising the standards for instruction in Jewish religious schools.

Three scholarly volumes published during the year dealt with the aims of Jewish education; two were in Hebrew, one in English—*Hebrew Education in America—Problems and Solutions* by Dr. Uriah Z. Engelman.

Also concerned with the objectives of Jewish education is the Research Institute in American Jewish Education, a non-partisan agency for psychological studies and educational projects in Jewish adjustment to America. The organization of this Institute was made possible in February 1947 by a grant from the American Jewish Committee. The Institute operates in two divisions: psychological research and educational experimentation.

The National Jewish Welfare Board, parent organization of community centers throughout the country, joined with the American Association for Jewish Education in support of a program of coordination between Jewish educational agencies and Jewish centers. A statement of principles released Sept. 3 urged the incorporation of educational aspects into the center's group work and group activities into the school's educational program.

In October, a College of Jewish Studies was opened in Los Angeles under the auspices of the Southern California Council of the Union of American Hebrew Congregations. The curriculum includes courses in Jewish history, religion, literature, and the Hebrew language.

CULTURAL ACTIVITIES

Aware of the responsibility American Jewry must assume now that the centers of Jewish culture in Europe no longer exist, Jewish community groups are examining the cultural resources of Jews in the United States.

A survey, covering all aspects of Jewish center work and considering the present and future activities of the National Jewish Welfare Board, was conducted during 1947 by 35 scholars under the sponsorship of the Jewish Welfare Board. On May 10, a report on the survey, incorporating 21 recommendations, was presented to the annual meeting of the JWB by Dr. Salo Baron and Dr. Oscar Janowsky, who were in charge of the entire study. One of the central points of the report was the recommendation for establishment of "an all-embracing Jewish-culture society," which would include within its sphere of interest Jewish history, literature, fine arts, crafts, dramatics and the theatre. The report recommended that membership in the Jewish center should be open to all inhabitants of the local community, "without distinction as to race, color or creed"; but it also urged the center program to place primary emphasis upon Jewish content.

Many activities in Jewish communities are already sponsored by the JWB, which furnishes centers with material on Jewish arts, music, and religious and traditional observances. In November, the JWB sponsored its 19th annual Jewish Book Month to sustain interest in Jewish literary creativity. Exhibits were arranged in public libraries, Jewish centers, YMHA's, and synagogues showing books in English, Hebrew, and Yiddish.

The Jewish Music Council, set up under the auspices of the JWB, conducted a Music Festival during February 1947 which included radio programs of Jewish music and a concert at Carnegie Hall in New York City.

Essential to the development of a wider interest in Jewish books are the publishing houses which are devoted to the making of books of Jewish interest. Among these are the Jewish Publication Society of America, the Bloch Publishing Company, the Behrman House, and Schocken Books, a well-known German, Jewish, and Hebrew publishing house whose American branch was established in 1946.

Histadruth Ivrith, the central Hebrew culture organization, publishes a Hebrew weekly, *Hadoar,* and maintains a special publication department which during 1947 published, in Hebrew, books of poetry and fiction as well as sociological and historical studies. Pargod, the dramatic group of the Hebrew Arts Committee which is sponsored by the Histadruth Ivrith and the Zionist Youth Commission, added to its repertoire Peter Frey's *Shylock 1947,* a modern adaptation of the *Merchant of Venice.* A new cooperative Hebrew publishing house, *Ohel,* has enriched Hebrew literature in America with one novel and two books of essays.

The Central Yiddish Culture Organization (CYCO), a federation of several Yiddish groups, publishes *Di Zukunft,* the oldest and most important Yiddish literary-social-scientific monthly in the world. The CYCO published new editions of several Yiddish classics, an anthology of Yiddish literature in Poland and books of poetry and social comment.

The Yiddisher Kultur Farband (YIKUF), left wing cultural group, issued 18 books from May 1946 to April 1947. These included history, fiction, and biographical and cultural essays.

Soon after the outbreak of the Second World War, the Yiddish Scientific Institute (YIVO) was transferred from Vilno to New York, broadening the scope of its research in the field of Jewish sociology. The year's annual conference was dedicated to Jewish reconstruction; 17 papers on this theme were delivered at the sessions. The exhibit, "Jews in Europe, 1939," consisting of some 4,000 items dealing with Jewish martyrdom during the Nazi occupation, was opened during the conference. YIVO also published six new books in Yiddish during the year.

The first Jewish Museum of its kind in the United States was opened in May under the auspices of the Jewish Theological Seminary of America. Housed in the former home of Mrs. Felix M. Warburg in New York City, the Museum opened with three large exhibits which included art and ceremonial objects of the past, and paintings and sculptures of modern Jewish artists on Jewish themes.

INTER-GROUP RELATIONS

During 1947, there was a marked decrease in organized anti-Semitic activity; on the other hand, latent anti-Semitic sentiment persisted, as indicated in public opinion polls and evidenced by discrimination against Jews in employment, education, housing, and resorts.

Two subversive organizations which achieved notoriety during the year were the Columbians and the Ku Klux Klan. The former group, which boasted of its anti-Negroism and anti-Semitism, used methods that were clearly Nazi-inspired. The leaders of the group were sentenced to jail after several incidents of anti-Negro violence. The Ku Klux Klan's activities were exposed, and subsequently membership applications declined. Also, California, New York, New Jersey, Indiana, Wisconsin, and Kentucky cancelled the corporate charter of the organization, thus barring open organizational activities in those states.

Jewish groups interested in community relations have continued to probe, inquire, and conduct research into the causes of anti-Semitism and the means of combating it. The American Jewish Committee and the American Jewish Congress maintained research programs which considered three aspects of the problem: roots of prejudice in the individual; group inter-action; and communications research. Most of these studies were carried out with the cooperation of psychologists, psychiatrists, and sociologists at academic institutions or in private practice. *Action for Unity*, by Prof. Goodwin Watson, published in 1947, reported his own survey and evaluation of methods now employed in promoting better community relations. A study by Prof. Gordon Allport, made public in January 1947 reported findings to the effect that about four-fifths of the school groups studied are prejudiced to some extent against members of racial, religious, or national groups different from their own. A major series of studies in progress at the University of California is on the personality structure of the anti-Semite.

DISCRIMINATION IN EMPLOYMENT

Early in 1947, the President's Committee on Fair Employment Practices issued its Final Report. This cited a survey, completed in the summer of 1946, showing that employment discrimination against Jews had increased markedly in the months following the war. Jewish agencies in the field of community relations, working through the National Community Relations Advisory Council, agreed on recommendations for the guidance of programs to combat discrimination in employment; recommendations which were embodied in a report, "The

Work of Jewish Agencies in the Field of Employment Discrimination."

During the period under review, Massachusetts and Connecticut joined the rank of states with FEPC laws on their books. Added to New York, New Jersey, Wisconsin, and Indiana, which had previously passed laws in this field, this made six states with FEPC legislation. Similar bills are pending in at least 18 other states.

While no Federal law has yet been passed, the Ives-Chavez bill, patterned after the New York State law, was considered by a Senate sub-committee during June. Jewish agencies testifying in favor of such legislation were the American Jewish Committee, American Jewish Congress, B'nai B'rith, and National Council of Jewish Women, all of which pointed out that bigotry is not merely a state problem but one which calls for Federal treatment.

DISCRIMINATION IN EDUCATION

Higher education in the United States was given a thorough review by the President's Commission on Higher Education, which made a year and a half survey of the question and submitted a report of its findings Dec. 15.

The report stressed the need for reorientation and expansion of higher education in the United States, together with immediate discontinuance of racial segregation and racial and religious quotas. According to the Commission's findings, many colleges and universities, especially in their professional schools, "maintain a selective quota system for admission, under which the chance to learn, and thereby to become more useful citizens, is denied to certain minorities, particularly to Negroes and Jews." Jewish groups hailed the report as a courageous and forthright appraisal of some of the weaknesses in American higher education.

Discrimination in educational institutions was also the subject of study and action among Jewish groups. A decennial census of Jewish students at American colleges and universities is under way, the first part of which was completed in September, and made public by the B'nai B'rith Vocational Service Commission. The study revealed that the proportion of Jewish students enrolled in professional courses dropped from 8.8 per cent in 1935 to 7 per cent in 1946. The fact that Jews go to college today in the same proportion as 11 years ago may be regarded at least partly as evidence of discrimination against Jews in professional schools and departments. Another survey revealed that the application blanks of 79 per cent of 171 leading non-sectarian colleges ask questions referring to the applicant's race, religion, or national ancestry.

Among the efforts to fight discrimination was a suit launched by the American Jewish Congress to void Columbia University's tax exemption because of alleged discriminatory practices in admission. The suit was rejected on a technicality in the courts of New York State.

An effort to obtain passage of the Austin-Mahoney Bill, which would have forbidden schools to discriminate in admitting students, failed mainly because of Catholic opposition. The bill was not reported out of committee of the New York State legislature.

Reflecting their concern over the problem was the strong support of the Jewish groups in New York State for a state university. In October, representatives of Jewish groups testified before Governor Dewey's special Commission on a State University and urged upon it a complete state institution of higher learning which would be accessible economically and geographically, and without racial or religious barriers.

DISCRIMINATION IN HOUSING

Realty discrimination was also a cause for grave concern. For the first time, Jewish organizations attempted to test legally the validity of restrictive real estate covenants. In February, a bill outlawing restrictive real estate covenants, supported by the American Jewish Congress, was introduced in the New York State Assembly, and a proposal to outlaw discrimination in mortgage financing because of race, religion, national origin, or ancestry was also submitted.

The legality of restrictive covenants is now under consideration by the Supreme Court of the United States. Four cases before the Court concern the validity of sales to Negroes or the uses of property by Negroes in violation of terms of covenants affecting the property. It is believed that upon the decision of the Court rests the question of the legality within the United States of restrictive covenants, regardless of the minority discriminated against. Four national Jewish organizations have filed amicus curiae briefs with the Supreme Court.

CIVIL RIGHTS COMMITTEE

When President Truman issued an executive order establishing a Committee on Civil Rights in December 1946, Americans throughout the country rejoiced in the hope that a national examination of the state of civil liberties would bring about a rededication of historic democratic American principles.

Jewish groups, together with labor, veterans, and other groups, urged upon the Committee to consider measures which would outlaw lynching, the poll tax, discrimination in education and employment. They advocated expansion of the Civil Rights Division of the Justice Department. While several of the agencies differed in opinion as to the type of legislation best suited to eradicate group tensions, all were agreed on the need for enlarged and improved machinery in the Federal Government to defend civil rights.

All Jewish groups hailed the recommendations of the President's Committee on Civil Rights made public in October. Judge Joseph Proskauer, president of the American Jewish Committee, declared that the report was "a major contribution to the strengthening of American unity and the preservation of democratic rights."

COMMUNAL WELFARE

Local Jewish welfare funds organized throughout the United States reached an all-time high in their capacity to secure philanthropic funds from all sections of the Jewish community. With the urgency of foreign needs, a large part of these funds was earmarked for help to overseas Jewry and to the agencies concerned with the development of Palestine.

With the liquidation of UNRRA on June 30, the American Jewish community assumed a heavy responsibility to raise the needed funds for adequate overseas work. The United Jewish Appeal raised approximately $125,000,000 for refugees, overseas needs, and Palestine.

Methods of communal work have been adapted to current needs and conditions, with mergers of local central agencies, extension of scope, membership, and representation. For example, the Detroit Federation changed its by-laws enlarging its Board to include representatives of communal agencies, trade, professional, youth and women's divisions of the campaign, councils of organizations, and individuals at large.

A characteristic of reorganized communal work is a broadening of scope to go beyond the traditional philanthropies and to include all matters of common concern to the local Jewish population. Local communities, organized in the Council of Jewish Federations and Welfare Funds, dealt with plans in Jewish education, community organizations, fund-raising, and Jewish community relations.

At its 15th annual General Assembly held in February 1947, the Council passed resolutions urging Great Britain to admit the fullest number of displaced Jews to Palestine and the United States to open its doors to a maximum number of refugees. It further urged that the American Jewish community so conserve and use its forces in coordinated planning and fund-raising that maximum results could be achieved.

In June, the CJFWF organized an

Institute on Overseas Studies to provide American Jewish communities and voluntary agencies with data essential for their guidance in determining long-range financial and functional responsibilities.

The increasing importance of Jewish communal work made apparent the need for an increase in the number of trained professional workers. With this need in mind, representatives of the American Jewish Joint Distribution Committee, the American Association for Jewish Education, The Council of Jewish Federations and Welfare Funds, National Community Relations Advisory Committee, National Jewish Welfare Board, National Conference of Jewish Social Welfare and Synagogue Council of America set up a special graduate training program for experienced personnel with previous training in social work and related fields. The bureau, known as the Training Bureau for Jewish Communal Service, began to function in July, with a carefully selected body of mature and experienced students who are being prepared for administrative and executive positions.

Delegates to the American Jewish Conference, which was organized in 1943 as a temporary unit to consolidate American Jewish activities in relation to political questions arising out of the war, voted Nov. 30 to establish a permanent agency to act as spokesman for Jews in America on domestic and foreign problems. The new organization will act through recognized Jewish agencies, affiliated with the organization, without affecting their autonomy. Since several major Jewish groups have not consented to affiliate with the new organization, its decisions will reflect the opinions of only one segment of the American Jewish community.

OVERSEAS AID AND RECONSTRUCTION

Relief measures during 1947 shifted their emphasis from temporary measures to sustain life to more permanent measures of constructive aid to rehabilitate and restore surviving Jews to economic independence.

The field of overseas relief outside of Palestine has been served by a number of organizations. The major Jewish relief agency is the American Jewish Joint Distribution Committee. During the period under review the JDC operated in virtually every field of rehabilitation and reconstruction. The scope of its operation may be gauged from the fact that during the first ten months of 1947 the JDC allocated $64,465,000 for its overseas work, operating in many lands and engaging in such activities as cash assistance, aid in kind, child care, medical aid, assistance to religious and cultural institutions, vocational training, promotion of credit and producers' cooperatives, organization of work projects, and facilitating of resettlement and emigration.

It is estimated that, in the spring of 1947, the JDC assisted in one form or another about 740,000 persons in Europe, or one half of the total surviving Jewish population in continental Europe outside the Soviet Union, including about 122,000 children out of a total of 179,000 Jewish children in that area.

The SOS (Supplies for Overseas Survivors), a JDC-fostered organization, shipped overseas over 5,400,000 pounds of donated supplies of food and clothing during the first ten months of 1947.

Other specialized agencies continued overseas aid within their special areas. The World Ort Union, with a long history in the field of vocational training, operated training facilities in Poland, Rumania, Hungary, Germany, Austria, Italy, and other countries. In February 1947, this organization unified its vocational training program with that of the JDC, Ort being charged with the administration and operation of over 650 training programs in Europe.

OSE (Organization au Secours des Enfants), an organization specializing in child and health care, has in operation over 425 institutions in Europe, including children's homes, medical and welfare centers, sanatoria and dispensaries.

In July an agreement was reached between the Union of Orthodox Rabbis of the United States and Canada and the JDC which will integrate programs devoted to the rehabilitation and advancement of Orthodox Jewish life in Europe. Such programs will be under the supervision of the Jewish Central Orthodox Committee, which will serve as the sole representative group for the consideration of the problems of Orthodox religious reconstruction.

Leading Jewish organizations in the United States formed a body known as Jewish Cultural Reconstruction, Inc., whose purpose is to locate and reclaim the many cultural treasures now scattered over the wide area of the former Nazi empire. Organizations such as the World Jewish Congress, Jewish Labor Committee, and Vaad Hatzalah have also contributed to the revitalization of culture among religious, labor, and other groups.

American organizations interested in the civil rights of Jews have opened European offices to assist the Jews of Europe regain full status as citizens of their countries of residence. The American Jewish Committee, American Jewish Conference, and World Jewish Congress have pleaded for fair restitution laws to enable Jews to regain property which belongs to them, or equitable reparations. These organizations have asked that just restitution laws be included in the peace treaties with Austria and Germany. They have also asked for civil rights provisions to be included in the treaties.

IMMIGRATION AND IMMIGRANT AID

About 25,000 Jewish survivors of Nazism arrived in the United States during 1947, including those who were admitted under President Truman's directive of 1945. Many of these immigrants, who have no relatives in this country to furnish affidavits, are brought in under corporate affidavits supplied by the Jewish organizations who have been so authorized: United Service for New Americans, Hebrew Sheltering and Immigrant Aid Society, and Vaad Hatzalah Emergency Committee, interested particularly in Orthodox rabbis and scholars and their families.

The United Service for New Americans expanded during the year, and it is now the second largest welfare agency operating in the United States, second only to the American Red Cross. This growth was necessary in order to meet demands of newcomers who have been finding a haven in the United States under the immigration laws and in accordance with the President's directive.

HIAS, the Hebrew Sheltering and Immigrant Aid Society of America, which has been engaged in immigrant aid for 40 years, maintains offices in about 50 countries. In March, at its annual convention, the organization adopted a budget of $4,010,000 for 1947. It urged the United Nations to apportion quotas to its member nations for absorption of Europe's displaced persons and refugees on an equitable, non-sectarian basis. With the corporate affidavit, Hias was able to rescue during the year 2,000 Jews stranded in Shanghai.

Many persons looked toward Congress for emergency action which would admit a fair share of displaced persons to the United States, but during 1947 no such action was taken. Rep. W. G. Stratton (R., Ill.) introduced in the House of Representatives, on April 1, a bill calling for the admission into the United States of a maximum of 400,000 displaced persons, over a period of four years, from UNRRA camps in Germany, Austria, and Italy. This emergency humanitarian measure was supported by Jewish, Catholic, and Protestant organizations, but did not come to a vote.

COOPERATION WITH THE UNITED NATIONS

In their efforts to aid the displaced Jews of Europe, American Jews have worked closely with UN representatives. In March 1947, the UN Economic and Social Council granted consultative status to the World Jewish Congress, of which the American Jewish Congress is a section, and to the Consultative Council of Jewish Organizations, of which the American representative is the American Jewish Committee. The Consultative Council in July advocated that the Economic and Social Council adopt a convention on genocide, making this act a crime under international law. The convention, which was presented in September to the UN General Assembly, proposed the punishment of rulers and public officials who "fail to employ every lawful means to prevent and punish genocide."

ZIONIST AND PRO-PALESTINE ACTIVITIES

The year in Palestine was politically a stormy one, resulting in strong repercussions in the United States. Unauthorized immigration of European displaced persons into Palestine brought forth retaliatory measures by the British Government, which then became the object of terrorist acts on the part of Jewish extremist groups. American Zionists and non-Zionists joined with the responsible Jewish community in Palestine in sharp denunciation of the terrorists, but at the same time, Zionists condemned the British policy of denying European displaced Jews, whose need for a home was so desperate, entry into Palestine. When Great Britain seized the ship *Exodus 1947* in July and sent the 4,500 immigrants aboard the vessel back to their port of embarkation in France, the Zionist Emergency Council, representing the major Zionist groups in the United States, called a protest demonstration in New York City. At the same time, the American Jewish Conference requested of President Truman and Secretary of State Marshall that an official United States protest be submitted to Great Britain.

The first ray of cheer on the Palestine scene occurred May 5, when the United Nations General Assembly voted to grant a hearing to the Jewish Agency during the special session on Palestine. The presentation of the Jewish case was made May 8 before the Political Committee of the United Nations General Assembly by Dr. Abba Hillel Silver, chairman of the Agency's American Section. Dr. Silver stressed the international obligation to insure continuous development of the Jewish national home in Palestine.

When the United Nations set up its Committee of Inquiry on Palestine, the American Jewish Committee, an organization not committed to Zionism but interested in the development of a Jewish homeland in Palestine, submitted June 1 a petition to the Committee recommending a United Nations trusteeship for the Holy Land. The petition stated its belief that a trusteeship was the best way to guarantee Jewish rights in Palestine until such time as independence could be granted. The petition recognized, on the other hand, that if the United Nations wished to evolve a final settlement in a short time, the only solution was partition.

In September, the majority report of the Committee of Inquiry on Palestine recommended partition of Palestine into an Arab and a Jewish state. Zionist leaders urged the United States to support the majority recommendation, promising cooperation in its implementation.

In this appeal the Zionist were successful, for not only did the United States support partition but two-thirds of the United Nations voted Nov. 29 to set up the two states in Palestine, an act which Dr. Silver described thus: "It marks a turning point in Jewish history. It is an impressive reaffirmation of the just claim of the Jewish people to rebuild its national life in its ancestral home."

Despite the pressure of political activity, Zionists continued to concern themselves with the spiritual and physical construction of Palestine. The Zionist Organization of America, the Labor Zionist Organization, the Mizrachi organization, and numerous other pro-Palestine groups contributed to the erection and maintenance of schools, industries, agriculture, and refugee and child care in Palestine. Hadassah, women's Zionist organization which supports a complete health program including a medical center, embarked on a five-year plan that will be the joint responsibility of Hadassah and the Hebrew University. This includes the erection of the Hebrew University-Hadassah Medical School, the first undergraduate medical institution in Palestine.

PART SIX

SCIENCE—APPLICATION AND PRINCIPLES

DIVISION XVIII

MATHEMATICS AND ASTRONOMY

MATHEMATICS

By G. T. Whyburn
Professor, University of Virginia

GENERAL

Both teaching and research activity in mathematics continued at a greatly accelerated pace during 1947. This resulted in a considerably larger volume of publication as shown by increased sizes of the research journals. In the face of rising printing costs the strain on funds normally available for this purpose has become acute. Subscription rates have had to be increased and the American Mathematical Society has had to increase its dues in order to meet the situation temporarily. The publication of research treatises in mathematics has been somewhat retarded by the same set of circumstances. This is true in particular of the Colloquium Publications of the American Mathematical Society.

The First Symposium in Applied Mathematics of the American Mathematical Society was held at Brown University in August 1947, marking the beginning of a contemplated series of such symposia to be held annually in an effort to foster research in Applied Mathematics. The subject of the 1947 Conference was "Non-linear problems in mechanics of continua." It was co-sponsored by the American Institute of Physics, the American Society of Mechanical Engineers, and the Institute of Aeronautical Sciences. Principal addresses were given by F. D. Murnaghan, J. J. Stoker, K. O. Friedrichs, and Alexander Weinstein, and in addition shorter papers and addresses were included. The Proceedings of the Symposium are to be published in book form by the American Mathematical Society.

In what follows, some of the significant developments in mathematical research will be referred to or briefly sketched.

ANALYSIS

The subject of the area of a surface received considerable development in 1947. This subject has occupied the interest of mathematicians over a long period of time, largely because of its great difficulty and elusiveness as exhibited in the celebrated example of Schwarz showing that the elementary area of a cylinder is not necessarily approximated by a sequence of inscribed polyhedral surfaces. In this connection, a study of "intrinsic" area was published by H. Buseman in 1947, who succeeded in freeing the concept of area from both its Euclidean and its infinitesimal character. He formulated five requirements which an acceptable area definition must meet. His study in particular was inaugurated by recent further paradoxical examples by Nöbeling and Besicovitch.

In a paper published in the *Transactions of the American Mathematical Society,* R. G. Helsel showed that the Lebesque area of two surfaces T and T* of the 2-cell (or disc) type are equal in case they are equivalent in the sense of Kerekjarto, *i.e.,* if they have simultaneous monotone-light factorizations $T = LM$, $T^* = LM^*$, where M and M* are continuous monotone mappings of the given discs onto the same middle space, S and L is a continuous and light mapping from S into 3-space. J. W. T. Youngs had previously shown this for the case of surfaces of the type of the 2-sphere; but his method does not extend to the case of the disc-type surfaces. Also in 1947, H. Federer extended to n-dimensions the concepts and characterizations of sets of finite linear measure in terms of local geometric properties of sets which had previously been carried out successfully for plane sets by Besicovitch, A. P. Morse, J. F. Randolph, and others. This was done in terms of a so called (ϕ,k)-rectifiability.

In an interesting study of the isoperimetric inequality and the Lebesque definition of surface area, Rado extended the classical plane and spacial isoperimetric inequalities:

$$a(C) \leqq l(C)^2/4\pi, \quad v(S)^2 \leqq A(S)^3/36\pi$$

where C is a (convex) closed plane curve and S a (convex) closed surface in 3-space, l(C) is the length of C and a(C) the area enclosed by C, A(S) is the area of S and v(S) the volume enclosed by S.

The concept of essential multiplicity of a mapping, as defined and used previously by Rado and others, received further development during 1947. In particular it was shown by P. Reichelderfer that essential multiplicity and e-multiplicity are equal for bounded transformations T on bounded plane domains or, equivalently, that the essential multiplicity of T at any image point z is equal to the number of "essential" components of $T^{-1}(z)$, where "essential component" is defined in terms of the index of T on the boundaries of approximating Jordan regions. Also, in a general article published in the *Bulletin of the American Mathematical Society,* Reichelderfer gave a discussion of the essential part of a surface, including the area problem, essential multiplicities of mappings, and other related topics.

A comprehensive study of the minimum modulus of a bounded analytical function was published by M. H. Heins during the year in the *Duke Mathematical Journal.* It was shown in particular that if f(z) is analytic and of modulus <1 for $|z|<1$, m(p) is the minimum of $|f(z)|$ on the circle with center O and radius p and m*(r) is the least upper bound of m(p) for $r \leqq p<1$, then $(1-r) \log m^*(r)$ always tends to a limit as r tends to 1.

In the field of abstract analysis, J. A. Clarkson succeeded in obtaining conditions on a real Banach space in order that it be equal to the space C(X) of all real valued continuous functions on a compact Hausdorff space X. He mentioned that an independent solution to this problem has been obtained by Kelley and Arens. A closely related result obtained by Kaplansky in 1947 asserts that the space C(X) considered as a lattice alone characterizes the space X, in the sense that if C(X) and C(Y) are equivalent as lattices, then X and Y are homeomorphic.

It was also shown by Clarkson, in connection with the well-known Darboux property of a real differentiable function f(x) on an interval (a,b), that for any two real numbers α, β, the set of all points x on (a,b) where the derivative of f(x) lies between α and β is always either empty or of positive measure.

ALGEBRAIC GEOMETRY

The 1947 summer meeting of the American Mathematical Society, held at Yale University in September, was highlighted by the well-organized and comprehensive Colloquium Lectures on abstract algebraic geometry by Oscar Zariski. Many interesting new developments were brought out, exhibiting the unusual effectiveness of a combination of topological, algebraic, and analytical methods in the field of algebraic geometry.

Also in a paper published in the *Transactions of the American Mathematical Society,* Zariski gave a systematic treatment of the general concept of a simple point in algebraic geometry. Strong supporting evidence was given for the thesis that the more general concept represented by the definition of a simple point of an r-dimensional irreducible algebraic variety v as a point p of v such that the ideal of non-units in the quotient ring of p has a basis of r elements offers the natural generalization of the classical concept of a simple point.

METRIC AND DIFFERENTIAL GEOMETRY

As defined by Menger, a straight line space is a finitely compact metric space in which any two distinct points are contained in exactly one set congruent to a Euclidean line. Menger had noted that segment addition could be defined in such a space so as to satisfy all conditions for an abelian group except the associative law. Norman Davids showed in 1947 that the associative law also could be satisfied by segment addition if, and only if, the geometry of the straight line space is Minkowskian, thus verifying an earlier conjecture of Buseman.

A study of invariant measures was published by P. R. Halmos in the *Annals of Mathematics*. Among other results, Halmos proved that every (1-1) measurable non singular transformation T of the interval into itself admits factorization into the form T = PS, where P is measure preserving and S is simple in the sense that its incompressible part is the identity.

ALGEBRA

The 1947 volume of the *Annals of Mathematics* was dedicated to J. H. M. Wedderburn, Professor Emeritus of Mathematics at Princeton University and editor of the *Annals* from 1911 to 1932. The January issue contains a dedication page and a splendid photograph which will be cherished by Wedderburn's many friends and admirers. Appropriately, this issue contains several articles closely related to Wedderburn's outstanding contributions to Algebra and Group Theory. For example, there are papers by Albert on Wedderburn's principal theorem for Jordan Algebras, by Jacobson on the theory of primitive rings, by Vandiver on a p-adic representation of rings and abelian groups and by R. Brauer on splitting fields of simple algebras. Also in this issue are found basic articles by P. A. Smith on foundations of Lie groups, by E. T. Bell on diophantine equations, Chevalley on algebraic Lie algebras, by Artin and by Bohenblust on the theory of braids (Artin treating mainly the geometric aspects of the theory and Bohenblust the algebraic), by Eilenberg and S. MacLane on cohomology theory in abstract groups, and several others.

In another paper by Eilenberg and MacLane published in the *Duke Mathematical Journal* there is given a purely algebraic interpretation of higher dimensional ($\geqq 3$) cohomology groups analogous to the group extension concept in the 2-dimensional case. In the same journal are to be found two additional papers bridging across the fields of algebra and topology, in both of these cases algebraic results being obtained with the aid of topological methods: Kaplansky obtains new theorems and new proofs of known theorems in valuation theory using topological methods. In particular he showed that if F is a field complete in a valuation and A is a complete metric algebra over F, then A is of bounded degree. Puckett showed that the closure algebra over a Euclidean space is a universal algebra for the class of all connected finite closure algebras. He proved the existence of certain interior transformations and used these in handling this and other related questions. His problem was suggested by an earlier contribution of McKinsey and Tarski.

The alternative division algebras over the real field R are: R itself, the field of complex numbers, the algebra of all real quaternions, and the algebra of all real Cayley numbers. Albert proved in 1947 that, as previously conjectured by Kaplansky, the alternative division algebras are the only absolute valued real algebras with a unit quantity.

NUMBER THEORY

The so-called Ramanujan function $\tau(n)$ is defined by the relation asserting the equality of the infinite product of the 24th power of $1-x^v$ for $v = 1,2, \ldots$ and the infinite sum of $\tau(n)x^{n-1}$, $n = 1,2, \ldots$ Several investigations on the possible vanishing of this remarkable function have been made since its discovery in 1916. In 1947 it was shown by D. H. Lehmer that this function can not vanish for $n < 3316799$.

In a paper published in the *Annals of Mathematics,* Marshall Hall proved that every real number is expressible as the sum of two numbers, each of which in turn is representable as a regular continued fraction with partial quotients not exceeding 4. Further, every real number < 1 is expressible as a product of two numbers with the same type of continued fraction representation.

GROUP THEORY

In connection with the Hilbert conjecture that any locally Euclidean connected group can be parameterized so as to become a Lie Group, Montgomery proved that any locally Euclidean connected and simply connected topological group of dimension > 1 contains a closed proper subgroup of positive dimension. Also in a paper on groups on analytical manifolds, Bochner and Montgomery improved on a former result of theirs to the effect that the group of all complex analytic homeomorphisms of a compact complex manifold into itself is a Lie Group by showing that this Lie Group is necessarily complex.

In an interesting study of topological rings published in the *American Journal of Mathematics,* Kaplansky developed structure theorems for compact rings. A notable feature of this development is the way in which compactness replaces classical chain conditions. Also the ring of continuous functions from a topological space to a topological ring is subjected to particular analysis.

TOPOLOGY

A satisfactory and usable criterion for metrizability of a perfectly separable topological space is afforded by the well-known regularity and normality conditions of Tychonoff and Urysohn. Without separability assumptions, no such comparable result is known. In a paper by R. H. Bing, published in 1947, a metrizability criterion for a topological space was developed which does not presuppose separability, by substituting a sequence of coverings of the space satisfying certain auxiliary requirements. It was shown by Dowker that in a metrizable space the property of paracompactness is equivalent to the property of being homeomorphic to a subset of general Hilbert space, a space being paracompact provided each covering of the space by open sets contains a locally finite refinement.

Combining topological and geometric methods, Gustin made a study of sets of so-called finite planar order, *i.e.,* sets in n-space which intersect every $(n-1)$-dimensional hyperplane in at most t points for some integer t. For example, it is shown that any such set of order t, where $t = n$, which is connected, is a simple continuous curve lying in the boundary of a convex set. Also in a paper published in the *Transactions of the American Mathematical Society,* S. Kaplan developed homology properties of arbitrary subsets of Euclidean spaces by using star-finite coverings instead of finite coverings as in the Cech theory, since the latter leads to particular situations for non compact spaces. He showed in particular that the family of countable star-finite coverings of a separable metric space form a complete family of coverings in the sense that it contains a refinement of any given covering of the space.

Using a generalization of the Alexander-Cech-Whitney cup product of co-cycles, Steernod succeeded in determining the homotopy classification of the mappings of an (n + 1)-dimensional complex into the n-sphere. H. Whitney published a preliminary account of a study of algebraic topology and integration theory indicating a treatment in terms of the chains and co-chains of algebraic topology of that part of the integration theory centering around Stokes' and related theorems. F. B. Jones introduced the notion of a folded open set and proved that a plane continuum is semi-locally connected if, and only, if its complement in the plane is "non-folded."

On the subject of continuous mappings viewed from the topological standpoint, an interesting fixed point theorem for upper semi-continuous multivalued transformations of an n-cell into itself was established by Hamilton and published in the *Duke Mathematical Journal*. In the same journal, P. A. White studied conditions on a transformation which, in addition to regularity assumptions, will insure the invariance of the generalized manifolds as defined by R. L. Wilder. J. H. Roberts showed that there exist countable fold open continuous transformations which increase dimensionality and that dimensionality can be increased or decreased at will by a 1-1 open transformation (not necessarily continuous).

An elementary theory of gratings, or sets of cuts, was developed by J. W. Alexander in a paper published in the *Bulletin of the American Mathematical Society*. This is shown to lead to homology theory in a natural way and to have numerous topological applications, introducing simplicity of formulation of topological problems among other advantages.

In connection with the question raised by Montgomery and Samelson as to whether there exists a compact fibering of some Euclidean n-space, Gail Young proved some interesting theorems about interior transformations on a plane from which it follows that no such fibering of 2-space can exist.

ASTRONOMY

By Rupert Wildt
Professor, Yale University

OBSERVATORIES AND ASTRONOMERS

Fifty years ago the Yerkes Observatory of the University of Chicago, located at Williams Bay, Wis., was formally dedicated. Dr. Otto Struve, for many years director both of the Yerkes Observatory and of the McDonald Observatory of the University of Texas, decided to hand over the directorship of both observatories to his collaborator, Dr. G. P. Kuiper, in order to devote himself to other tasks. Dr. Henry Norris Russell, director of the Princeton University Observatory, retired, and Dr. Lyman Spitzer, Jr., formerly of Yale University, became his successor.

On the occasion of the 400th birthday of the great Danish atronomer, Tycho de Brahe, the University of Copenhagen conferred honorary degrees upon Dr. Otto Struve and Dr. Harlow Shapley, the latter director of the Harvard College Observatory. The Astronomical Society of the Pacific honored Dr. Bernard Lyot, of the Paris Observatory, by awarding him the Catherine Wolfe Bruce Gold Medal. He is best known for his invention of the coronograph, an instrument permitting to photograph in broad daylight the faint glow of solar corona, formerly accessible to visual observations only during the brief minutes of a total eclipse of the Sun.

Leslie C. Peltier, of Dephos, Ohio, an amateur astronomer of unusual accomplishments, received an honorary degree of doctor of science in astronomy from Bowling Green State University, Ohio. He has discovered 10 comets, for each of which he received a Donohoe medal from the Astronomical Society of the Pacific, is credited with the independent discovery of two novae, and is also one of the high ranking observers for the American Association of Variable Star Observers.

In 1947 the American Astronomical Society held two meetings at Evanston, Ill. during the first week of September and at Columbus, O. during the last week of December. On the second occasion, Dr. Walter S. Adams, director emeritus of the Mount Wilson Observatory, delivered the annual Henry Norris Russell Lecture, his subject being "Gaseous Clouds in Interstellar Space."

At the optical shops on the campus of the California Institute of Technology, the figuring of the optical surface of the 200-inch mirror was completed. In November, the mirror was transferred to the new Astrophysical Observatory of the California Institute of Technology on Palomar Mountain in San Diego County. There the mirror will be coated with a highly reflecting layer of aluminum, produced by evaporating the metal in a vacuum chamber. The dome and mounting of the 200-inch telescope have been ready for some time, and thus operation of the giant instrument may start in the near future.

TOTAL ECLIPSE OF THE SUN

A total eclipse of the Sun on May 20, 1947 was studied extensively by four expeditions at Bocayuva, Brazil, although partial cloudiness hampered some of the projects. Moving pictures of the eclipse were flown to the United States, and within 61 hours after the event they were broadcast over the New York-Schenectady-Philadelphia-Washington television network. There were five expeditions stationed along the Argentine part of the eclipse track, and four of them were favored by the weather. Among these must be mentioned the expedition from the Argentine Naval Observatory, which filmed the eclipse with four sound-film cameras, registering the time signals on the sound track. This work was done in cooperation with the Finnish astronomers of the Helsinki Observatory to determine the difference in longitude of South America and Africa.

SUNSPOT

The current sunspot cycle is approaching the maximum of activity. The largest single sunspot ever recorded appeared in March 1947. By April the spot had divided into several parts which grew to form the largest group of sunspots ever observed. When largest, it appeared to cover more than one per cent of the apparent solar disk, its area being 6,300,000 square miles.

COMETS

The year 1947 was unusually rich in comets. By Dec. 13 comets had come under observation, but none of these objects was conspicuous to the naked eye. Then a spectacular comet, as bright as a first-magnitude star, was discovered close to the Sun by several observers in the Southern Hemisphere. At the time this annual review went to press, only meager information about this object was available in the United States. In particular, it remained doubtful if the comet would, before fading out gradually, move in its path around the Sun far enough to the North to permit detailed physical study by the powerful telescopes of the numerous northern observatories. Few big telescopes are located in the Southern Hemisphere, and even less are equipped with the auxiliary apparatus, like spectrographs and polarimeters, necessary for physical analysis of the comet's light. Our knowledge of the physical constitution of comets has little advanced during the last decades because Nature refused to provide astronomers with material suitable for study. Since the last passage of Halley's comet in 1910, there has not appeared another comet of comparable brightness, and the modern techniques of physical analysis developed since that time can profitably be applied only to such highly luminous objects.

The discoverer of one of the faint comets mentioned above, C. A. Wirtanen, also found at the Lick Observatory a minor planet, which proved to be one of the fastest moving of such bodies known. According to the calculations by L. E. Cunningham, it moves in a nearly circular orbit close to that of Mars, coming within 6,000,000 miles of Mars' orbit. The period of revolution around the Sun is about 27 months, the shortest period of any numbered minor planet except Eros. The new object is only a few miles in diameter.

NOVA

A nova appeared in the constellation of Sagittarius early in May 1947, but the exact time of its flaring-up is unknown. When the star was spotted accidentally on a photographic plate taken at the Mt. Wilson Observatory it was already past its maximum brightness, which probably did not exceed the eighth (photographic) magnitude.

MARS' ATMOSPHERE

The infrared sensitive PbS photoconductive cell, developed during the war for military purposes, is now rendering valuable aid in studying the chemical composition of planetary atmospheres. With such a cell attached to an infrared spectrometer, G. P. Kuiper, at the McDonald Observatory, has for the first time recorded the spectrum of Mars in the region of 1 to 2.5 microns. Carbon dioxide absorption bands near 1.6 microns were found to be about three times as strong in Mars' spectrum as in the spectra of the Sun and Moon taken at the same zenith distance. The carbon dioxide absorption in these comparison spectra results from the single passage of the celestial radiations through the Earth's atmosphere. Since the solar radiation reflected from Mars' surface has passed twice through this planet's atmosphere in addition to traversing the terrestrial atmosphere, triple strength of the carbon dioxide bands in the spectrum of Mars indicates that the planet's atmosphere contains approximately the same total amount in grams per square centimeter of carbon dioxide as the Earth's atmosphere. No other gases having strong infrared absorptions, like methane, ammonia, or nitrous oxide, were found; they could not be present except in exceedingly small quantities.

Repeated earlier attempts to identify carbon dioxide in Mars' atmosphere by other absorption bands, located in the photographically accessible infrared, had failed because these bands are intrinsically much weaker than the ones studied by Kuiper. The seasonal growth and shrinkage of the white polar caps and the appearance of transitory clouds, obliterating the surface detail, have generally been taken as evidence for the presence of water on the planet, but the direct spectroscopic proof is still outstanding. The technique introduced by Kuiper perhaps will also permit a spectroscopic test for water vapor on Mars. At any rate, Kuiper's observations go far toward justifying the prevalent opinion of a significant similarity between the atmospheric constitutions of Mars and Earth. On the other hand, the atmosphere of Venus is known to contain at least 100 times as much carbon dioxide as that of the Earth.

STARS AS MAGNETS

The origin of the magnetic field of the Earth is one of the major unsolved problems of cosmic physics. Already 55 years ago Sir Arthur Schuster suggested the association of magnetic fields with rotation in astronomical bodies, but it was not until 1913 that Hale and his collaborators at the Mt. Wilson Observatory established the existence of a weak general magnetic field on the sun, by measuring the minute splitting of suitable absorption lines (inverse Zeeman effect) in the solar spectrum. A comparison of the magnitude of the sun's general magnetic field and its equatorial speed of rotation (about 50 gauss and 2 km/sec., respectively) with the average equatorial speed of rotation for stars of type B, A, and early F (about 60 km/sec.) leads to the prediction that these may have magnetic fields of the order of 1500 gauss (at the poles), on the hypothesis that the field strength increases directly with the equatorial speed of rotation.

Rapid rotation of stars results in widening of stellar absorption lines and a characteristic line profile, quite common among early-type stars. But a small proportion of these have very sharp lines, showing little or no rotational broadening, and some of these stars are presumably in rapid rotation, with their axes directed nearly toward the observer on Earth. If strong magnetic fields exist in the latter sort of stars, the Zeeman effect may be sufficiently large to affect line width perceptibly; moreover, with plausible assumption regarding the characteristics of the field, it can be shown that the integrated Zeeman effect for spectrum lines will be preferentially in one direction, *i.e.*, the components of the lines transmitted through analyzers for right-handed and left-handed circularly polarized light will be displaced in opposite directions by amounts proportional to the field strengths and to the atomic Zeeman effects of the particular lines.

These predictions were made by H. W. Babcock, of the Mt. Wilson Observatory, and then tested by him through observations of the star 78 Virginis (spectral type A2p). Placing a differential circular analyzer in front of the slit of the coudé spectrograph of the 100-inch telescope, he discovered in the spectrum of this star displacements of the metallic absorption lines that are interpreted as a Zeeman effect, resulting from a general magnetic field having a strength of 1500 gauss at the pole. The coincidence of this figure with the predicted field strength is, of course, accidental. A control star, ε Pegasi (spectral type KO) showed no effect. Since no appreciable rotation has ever been detected for stars as late as G and K, it was to be expected that ε Pegasi would possess no strong general magnetic field, and that the Zeeman effect should not be observed in its spectrum. The test was sensitive enough, with the equipment used, to discover a field of at least 500 gauss. Since the Zeeman splitting increases with the square of the wave length, for constant field strength, a considerable gain may be expected in the future by going to the red or perhaps infrared region of the spectrum.

Furthermore, Babcock has proposed the query of whether the longitudinal Zeeman effect would be capable of giving the relationship between the polarity of a stellar magnetic field and the direction of rotation of the star. A decision might be possible if a measurable Zeeman effect should be found in one of the components of a visual double star where the direction of orbital motion is known, on the assumption that the sense of rotation on its axis is the same as that of the revolution in its orbit.

By the end of 1947, Babcock announced even more startling results for the star HD125248 (type AOp), which was known to exhibit strictly periodic changes in the strength of the absorption lines of ionized europium, while lines of ionized chromium vary in the opposite sense, but with the same period of about nine days. At the time of the maximum of the Eu II lines an integrated Zeeman effect corresponding to a general magnetic field had a strength of about between 7000 and 8000 gauss at the pole. During the Eu II minimum, when Cr II lines were strong, a Zeeman effect characteristic of a field of the order of 6000 gauss was observed, but the magnetic polarity was opposite to that found at the Eu II maximum. Practically all measurable lines show this reversal of polarity, including those of Ca II, Fe I, and Fe II. A single plate at intermediate phase, on which both lines of Eu II and Cr II are visible, exhibits considerable variance in the effects on the several lines, some appearing to be of one polarity and some of the other, but the average effect corresponds to a field near zero.

SPOTS ON STARS

The importance of these magnetic discoveries for astrophysics in general can hardly be overestimated. So far the only place in nature where magnetic fields of several thousands of gauss are observed has been in the sunspots, whose physical constitution is still quite obscure. Sunspots, however, cover only an insignificant part of the Sun's total surface, even at the peaks of the sunspot cycle. Their existence could hardly have been anticipated from a study of the total light of the Sun before the advent of the modern precision methods of photoelectric photometry, in whose development G. E. Kron has taken an important part. Are the stars showing magnetic effects, in the light integrated from all over the disk, then covered with huge spots? It would be rash to jump to this conclusion. But recent work at the Lick Observatory has indeed given convincing evidence of the existence of dark patches on the surface of a star of spectral type G5 (N.B. stars of this type do not rotate rapidly and therefore would not be suspected of carrying measurable magnetic fields). This star is the fainter component of the eclipsing variable AR Lacertae, whose other component is a KO star.

During his systematic study of the light curve of this system, which has a period of almost exactly two days, Kron noted small abrupt irregularities in the light variation, occurring during the eclipse of the G star by the K star, his discovery being due to the extreme accuracy of his photoelectric photometry. An examination of all data for AR Lacertae shows that, without exception, the irregularities repeat themselves with high precision from one revolution of the binary to the next, but that changes in the nature of these irregularities take place within a few weeks to a few months. The peculiar variations can be explained on the hypothesis that the surface of the G5 star has upon it huge light and dark patches, undergoing eclipse by the KO star. The patches must be of such size that a projected hemisphere at times has as much as 20 per cent of its area covered, while individual patches cover as much as 3 to 5 per cent of the area. The observations not only indicate that the patches are eclipsed by the KO star, but that they move, and that they form and dissolve. Moreover the patches appear and disappear around the limit of the stellar disk, with rotation of the binary. Kron expects a critical study of large numbers of accurate observations of AR Lacertae may lead to a detailed picture of the sizes, latitudes, and motions of the patches.

STELLAR PROMINENCES

Luminous eruptions from the Sun, named prominences, are easily seen during a total solar eclipse, when the blinding light of the disk is shielded by the dark Moon. Using a spectroscope, they can also be watched outside eclipses, because of the bright-line spectrum emitted by these gas clouds, and in recent years their development and decay has even been studied by cinematography. Such moving pictures of prominences, forming irregularly shaped clouds, or fountain-like ejections, and sometimes arches appearing to rest at both ends on the solar surface, never fail to make a deep impression on the spectator, astronomer and layman alike. While most prominences are objects small compared with the Sun, at least one instance is known when an arch-shaped prominence blew up to a height almost equal to the solar radius. It is interesting to speculate what sort of a view this phenomenon would have afforded to an astronomer on a star so remote that the apparent diameter of the Sun's disk had sunk below the optical resolving power of his telescope. Pointing a spectroscope at the Sun, this astronomer may have been surprised at the short-lined appearance of a bright emission spectrum superimposed upon the dark-line, or Fraunhofer, spectrum of the Sun, provided that the amount of light emitted by the prominence was comparable with the total light of the Sun. Conversely, one may ask: have prominences ever been observed on other stars?

Many stellar spectra indeed are known to have bright-line features, and some stars have emission lines undergoing with time. The routine studies of stellar spectra, of which it is impossible to give an accurate account in an annual review like this, have led to the accumulation of an immense wealth of observational data still awaiting physical interpretation. Compared with absorption spectra of the stars, their emission features are not well understood, particularly those of the so-called later spectral types (G,K,M). The emission features of many stars of spectral classes A and B have been explained satisfactorily, essentially through systematic studies by O. Struve, as resulting from luminous gaseous shells and rings surrounding these stars. These objects appear to be of stationary nature mostly, thus differing from the solar prominences. Recently, however, Struve has studied a star, UX Monocerotis, whose variable spectral characteristics he feels can best be explained by postulating semi-permanent features not unlike the big arch-shaped solar prominences. This star is an eclipsing binary, consisting of a small A-type star and a large more massive G-type star. Struve suggests that gas is flowing almost constantly from A star to the G star in roughly semicircular orbits (the line connecting the two stars forming the diameter of the semicircle), and that there is a second symmetrical current from the other side of the G star to the other side of the A star. As the two stars revolve around their center of gravity, the gas current gives rise, for an observer on Earth, both to emission and absorption lines showing variable radial velocity, according to the varying orientation of the system with respect to the line of sight.

SMALL DARK NEBULAE

In recent years the problem of the origin of the giant stars has gained prominence in cosmogenic speculation. Many stars are observed whose energy output is so great that the known sources of atomic energy production would not suffice to keep them shining at the present rate for more than a small fraction of the period now generally believed to represent the age of our galactic system, that is to say, a few billion years. Very likely, therefore, these stars have originated, so to speak, in "historic" times, and the birth of giant stars may be continuing in our stellar system right now. This surmise naturally leads to the question of whether the early stages of this evolutionary process, protostars as Spitzer has called them, can be identified by observation. Theoretical investigations by F. L. Whipple and L. Spitzer have attempted to formulate a gravitational theory of the condensation of stars from a tenuous medium of interstellar gas and solid grains. No conclusive results have been reached so far, but it becomes necessary, at any rate, to survey the evidence for the presence in our galaxy of relatively small dark nebulae, since these probably represent the evolutionary stage just preceding the formation of a luminous star.

Large dark nebulae, mostly of irregular shape and often like wind-blown wisps, appear in projection against the rich star fields of the Milky Way. These objects have forced themselves upon the attention of astronomers since the early days of celestial photography and have since been subjected to intensive study. A systematic search for small dark circular or oval nebulae, the hypothetical protostars, was recently undertaken at the Harvard Observatory by B. J. Bok and E. F. Reilly, who for convenience refer to these objects as "globules." Inspection of a large variety of published photographs revealed numerous globules with angular diameters ranging from 5 seconds to 10 minutes. They seem to show a preference for the regions of Sagittarius and Ophiuchus and for the Scutum cloud, but some isolated examples of large globules are found in the anticenter region of the Milky Way. The region of the diffuse nebula Messier 8 abounds with globules. The emission nebula near η Carinae is also rich in globules. In order to find the true diameter of these objects from the angular one, their distances must be known. Estimates of the distances, based on methods which can not be discussed here, give linear diameters of 12 globules near Messier 8 between 10,000 and 35,000 astronomical units (mean distance from Earth to Sun), but some globules near the anticenter region appear to have diameters of the order of 100,000 astronomical units. Judging by the light of stars shining through some of these objects, the extinction of light along its path through the globules is from 2 to 5 magnitudes for the smaller ones, and about 1 magnitude only for the largest ones. Further investigation of the amount of extinction may permit the estimation of the total mass of the globules. These interesting objects merit careful study with the powerful Schmidt telescopes now being put into operation and with the largest available reflecting telescopes.

THE INVISIBLE NUCLEUS OF OUR GALAXY

From the days of the elder Herschel it has been recognized that the concentration of stars toward the Milky Way in the heavens means that they are actually grouped in space in a region having roughly the shape of a flattened disk. But our notions of the linear dimensions of the entire system were rather slow to evolve and had to be revised fundamentally in recent years, because it is now realized that the Galaxy contains vast masses of obscuring matter in the form of interstellar dust. This tenuous haze extends only a few hundred parsecs on either side of the galactic plane, probably thinning out gradually. Space beyond must be extremely clear for there is little or no evidence of increased absorption of light for very remote star clusters and nebulae, looking at right angles to the galactic plane. However, obscuration is so heavy in all directions around the galactic plane, that the study of the spatial arrangement of stars throughout our system is seriously interfered with. In fact, it is admitted now that the nucleus of the Galaxy is hidden from view by obscuring matter. Dynamical analysis of stellar motions reveals the approximate position of the gravitational center of the Galaxy among the great star clouds of the constellation Sagittarius. But these star clouds themselves, conspicuous though they are, are much too close to the Sun to be identified with the galactic nucleus; for stellar dynamics locates the gravitational center at a much greater distance, causing an estimated obscuration of 10 stellar magnitudes in blue light. Shall the astronomer's curiosity forever be denied access to the core of our stellar system?

There appears to be some hope of penetrating the cosmic fog, according to recent work at the Mt. Wilson Observatory. Astronomers have long been aware of the haze-piercing power of red or, still better, infrared radiation, a phenomenon now generally familiar from its wartime application to aerial photography. Practical application of the principle was delayed by lack of sufficiently fast infrared-sensitive photographic plates. Instead, J. Stebbins and A. E. Whitford have brought infrared-sensitive photoelectric cells to bear upon the problem of the galactic nucleus, working at effective wave lengths of 10,300 A and 7190 A. At the focus of the 60-inch telescope a diaphragm, selecting a field in the sky of 8.6 minutes of arc in diameter, was placed in front of the photoelectric cell. The sky was allowed to drift with the diurnal motion across this diaphragm, and the intensity variation during each sweep was recorded automatically. The sweeps of successive longitudes usually gave maxima near the galactic equator, outlining a bulge extending about 8° in longitude and 4° or 5° in latitude, with center near galactic longitude 326.5°. The light of this bulge adds up, when corrected for obscuration, to a total quite comparable with light, also observed by Stebbins and Whitford, of an equal section of the great spiral nebula in Andromeda, which is now generally regarded as a system closely akin to the Galaxy. Repetition of this work with photocells sensitive to infrared light of even greater wave length, which is planned for the near future, may bring a still better view of the nucleus of our stellar system.

ENGINEERING AND CONSTRUCTION

STRUCTURAL ENGINEERING

By Walter E. Hanson
Assistant Professor, University of Illinois

GENERAL

The construction industry, second only to agriculture, continued to grow throughout 1947 with some indication that construction costs had reached their peak and were becoming somewhat stabilized at a level substantially above that of pre-war days. Some examples of efforts to stabilize construction costs were evident during the year. A few labor organizations and the contractors with whom they work were able to reach agreements to freeze wages at current scales for a certain period. The new wage agreements were entered into to stabilize the major element of uncertainty in construction costs, thus helping contractors to reduce the factor for labor contingency in their estimates. Another stabilizing influence was a small trend toward firm-price quotations from equipment and materials suppliers.

The increase above pre-war costs has been about the same as the general average for other services and commodities. Nevertheless, there was considerable evidence during 1947 that many construction projects were being deferred waiting for a considerable drop in costs. Most contractors agreed that no single cause is responsible for current high construction costs. Reductions will come only through elimination of uncertain ties, increased productivity of workmen, a more regular supply of materials, increased efficiency by management, improved methods of construction, and a number of other factors.

Evidence that our industrial system was not yet back to normal was found in many parts of the country in the form of completed bridge piers standing idle, waiting for steel. Major examples of this existing condition were the piers for the bridge at Memphis, Tenn., and the piers of the Tacoma Narrows Bridge. In both cases, construction progress was stopped or severely retarded because steel was either found to be too costly or not to be had at all.

The total dollar volume of United States construction contract awards during 1947 was about 7 per cent above 1946. The increase was the result of more public construction, which showed an increase of about 18 per cent. Private and other construction fell a few per cent below the record high of 1946. The high volume during 1947 was attained despite a mid-season slowdown in the heavy construction category. The construction industry observers have pointed out that the upswing was due to general acceptance of current conditions which resulted in decisions to go ahead with construction.

If personal and industrial income continue throughout 1948 at the high level existing at the end of 1947, there is reason to believe that some increase in construction volume is inevitable for the coming year.

RESEARCH

The continued unparalleled popularity of research, such as the world has never seen, was evident everywhere during 1947. Industry, Congress, state legislatures, and private philanthropists were swayed more easily by appeals for research than for any other activity. Everywhere there is growing evidence that structural designers consider it unwise to embark on a major engineering project without taking advantage of the many scientific aids that are available for developing and testing new materials and methods as well as improving past practices. With construction volume at the 1947 level, it is apparent that even small improvements in design and construction procedure result in marked savings.

The Commerce Department's Office of Technical Service awarded several contracts for research of significance to the construction industry as a part of a $1,500,000 comprehensive research program. The Civil Works Division of the Corps of Engineers initiated an investigation and research program of much greater scope than any previous undertaking. About $500,000 of the research under the Civil Works Division will deal with structural problems. Along with the expanded programs under the direction of the Bureau of Reclamation has come increased activity in its research laboratories.

Funds for research to be administered through the engineering experiment stations of universities and colleges increased many times over those available during previous years. Experiments continue in university and governmental laboratories, directed toward the goal of better understanding of the behavior of concrete in the plastic range. More experimentation is still needed, and when completed, will no doubt bring about more accurate and economical design methods.

The aerodynamic instability of bridges continued to receive the attention of several engineers and engineering organizations. Several test programs continued to make progress, one of which was the investigation and classification of a wide range of sections by wind-tunnel tests. The results of completed tests indicate that certain cross-sections have complete aerodynamic stability. These and subsequent tests will no doubt provide data invaluable to the designers of long-span bridges.

AIRPORTS

The $1,000,000,000 national airport program under the supervision of the Civil Aeronautics Administration was put into operation during 1947. Allocation of funds put approximately $70,000,000 of work underway for the improvement of 400 existing fields and construction of an equal number of new fields. The complete program contemplates the construction or improvement of over 4,400 civilian airports of five general classes over a period of seven years. Airfields have been divided into five classes varying from Class 1, which will carry small privately owned planes, to Class 5, for planes weighing over 74,000 lbs.

One of the larger and more interesting airport developments in the United States during 1947 was the $20,000,000 expansion of the San Francisco Municipal Airport. The construction included a 6,000,000 cu. yd. fill which was carefully controlled during placing operations to consolidate effectively the underlying mud. One of the more difficult problems was the construction of a safely compacted, stable fill in an area covered by water over a soft mud bottom reaching to a depth of 80 ft. in certain places. The fill was placed in a manner which squeezed out the undesirable material as the fill progressed and effectively compacted such mud as remained.

A new $13,000,000 airport for Baltimore, Md. was under construction during the year. The contractor, after some experimenting with loading, hauling, and compacting machines, reached a steady pace of moving some 50,000 cu. yd. of material per day. A 200-ton super-compactor on large pneumatic tires is expected to solidify the material sufficiently so that a comparatively thin pavement can be used. The super-compactor will be used to compact undisturbed material so that excavation and replacement will not be necessary.

BRIDGES

Very few large bridges were actually under construction during 1947. The coming year will no doubt witness the start of several large bridge projects now in the planning stage. A large number of small bridges and grade separations were completed as part of the development of highways and expressways, but these are too numerous to warrant discussion.

The Eads Bridge over the Mississippi River at St. Louis, Mo., after 74 years of service, now carries increased highway and railway traffic. A new highway deck was completed in 1947, substituting new steel floorbeams with I-Bm-Lok decking for old steel and wrought iron floorbeams with timber stringers and decking. No appreciable delay in the steady flow of traffic was reflected at the toll house because two lanes of traffic were kept open during construction.

A $2,000,000 highway bridge across the Feather River at Marysville, Calif. was completed in August 1947. The bridge is 2,693 ft. long with a deck width of more than 66 ft., rising about 70 ft. above the river bed. Steel plate girder spans, varying in length from 46 to 161 ft., are used as required to fit the topographical features and the 23 ft. adopted spacing of floorbeams. The tall conspicuous piers for the bridge were carefully designed and proportioned. During most of the year, they will extend as much as 55 ft. above the dry river bed, but in time of flood the water rises 40 ft. above low water stage. The swift current and heavy drift carried by floods made it inadvisable to use open column bents or towers, so streamlined piers were designed, presenting a smooth and continuous surface to stream flow up to a level above flood height.

Two San Francisco Bay crossings were recommended during 1947. A new bridge parallel to and just north of the present San Francisco-Oakland Bay Bridge was proposed at a total cost of about $100,000,000. A causeway-tube crossing, estimated to cost about $135,000,000, was advocated by an Army-Navy board. The California Toll Bridge Authority has approved both crossings for construction, and, after further engineering studies, will decide which of the two structures is to receive first priority.

USE OF PRECAST CONCRETE BUILDING CONSTRUCTION

Many engineers believe that the simulated factory production approach to construction offered by the use of precast concrete will eventually play an important role in post-war building construction. With the completion of each new project using this new technique will come improvements in design and construction procedure.

Precast reinforced concrete floor slabs were produced on a mass production basis and used to expedite the construction of 110 buildings for a United Nations' housing project in New York. Nine different designs comprise the 110 buildings in which the types of floor slabs required were held to a minimum to simplify the form work. The relatively small number of 100 molds were used to precast 6,800 slabs.

Two concrete storehouses were completed at the Naval Supply Depot, Mechanicsburg, Pa., as experiments to explore the possibilities and relative merits of precast concrete as compared with other methods of construction. The bents which support the roof framing and provide partial support for the walls under wind loading were built from a number of precast hollow box sections. The roof slab and framing was precast in ribbed panels 5 ft. wide and 20 ft. long.

Another example of the use of precast concrete construction is a sales building in Pittsburgh, Pa. It is one of the first two-story precast concrete structures. Ample lateral stiffness is claimed, despite the fact that the designers of the building made no attempt to maintain continuity as far as frame action is concerned. Here again, as in the case of all precast structures, the units were made by mass production methods. Forms for the structural members were all of steel construction and adjustable to the variation in girder and column dimensions. Field erection of the structural frame for this 110 x 120 ft. two-story building was completed in 13 working days.

NEW DESIGN PROBLEMS AT THE NAVAL AIR STATION IN MARYLAND

The testing of aircraft electronic devices introduced some new design problems for the structural engineer to solve at the Naval Air Station, Patuxent River, Md. A hangar nearly completed in 1947 will accommodate the testing of electronic devices under installed service conditions in all types of Navy aircraft. The entire interior of the hangar is shielded by galvanized wire mesh to provide a minimum of electronic interference. Other efforts to minimize the electronic disturbances include the use of double doors, bonding of water pipes to the shield, and the installation of the lights in a way which places any associated disturbance above the wire mesh shield. The hangar has no windows, a design feature which makes possible the continuous shielding provision.

FOUNDATION PROBLEMS IN BOSTON AND CINCINNATI

The construction of the new John Hancock Mutual Life Insurance Company office building in Boston proceeded throughout 1947 and should be mentioned primarily because of the extraordinary foundation problems. Bedrock varies from 128 ft. to 160 ft. below street level. A floating foundation was not considered practicable because of the excessive weight of the structure. The caisson type foundation was abandoned because of the risk of disturbing the underlying soft blue clay which might result in the settlement of surrounding structures. H-pile sections were selected on the basis of economy and as the type of foundation that would cause a minimum amount of disturbance to the subsurface strata. On the basis of satisfactory load tests on two test piles driven to bedrock, a value of 90 tons per pile was permitted by the Boston Building Department for the 14-in., 117 lb., H-piles used on the job. Approximately one-third of the piles was received in single lengths, the remainder was spliced by welding. A total of 1,637 piles was used in the foundation.

Some phases of the construction of the Terrace Plaza Hotel and store building in Cincinnati, O., are of interest to structural engineers and constructors. Test borings indicated that rock was more than 150 ft. below street level. However, the presence of sand and gravel formations of good bearing value at the subgrades required for the lowest basement levels made it possible to use a concrete mat type foundation. During the excavation for the foundation, extending to a maximum of 55 ft. below street level, one large adjacent building required extensive underpinning, while another was prevented from subsiding by the installation of steel sheet piling with a prestressed supporting structure in the form of cross-lot bracing. During erection of the steel the confined construction area and the absence of storage space at the site necessitated accurate coordination between delivery of the steel and its erection.

DAMS AND RELATED CONSTRUCTION

The U. S. Army Engineers and the Bureau of Reclamation accelerated their planning and construction activities, looking toward the earliest possible realization of benefits from the developments of land, water, and related resources in almost every state. The Union Village Dam in the Connecticut River Basin, under the Army Engineers, and the Central Valley Project in California, under the Bureau of Reclamation, are two projects which demonstrate that the United

States, from one end to the other, is benefiting from the work of these two great organizations. Construction on some of the larger projects was retarded early in 1947 because of inadequate funds, but in general the momentum achieved in 1946 was carried through 1947 with a considerable increase in new construction.

CENTRAL VALLEY PROJECT

The Central Valley project in California is one of the largest development programs under the supervision of the Bureau of Reclamation. Progress was necessarily retarded because of the wartime curbs on nonmilitary construction, but, during 1947, construction without appreciable restriction resulted in the completion of some of the individual projects which comprise this large program. Some parts of the Central Valley project are now in operation, but the major function of the project—that of diverting water from the Sacramento Valley in the north for use in the San Joaquin Valley in the south—can not be performed until 1949 or 1950.

Shasta Dam, the largest and most costly single item of the Central Valley project, received a small amount of final construction during 1947 with the installation of three drum gates. The dam is a concrete structure, second only to Grand Coulee in size. It is 500 ft. high and provides a reservoir storage capacity of 4,500,000 acre-ft.

The construction costs of the Delta-Mendota Canal and the Friant-Kern canal rank second and third, respectively, to Shasta Dam. The Delta-Mendota Canal will have a capacity of 4,600 cu. ft. per sec. and will extend from the Sacramento-San Joaquin delta some 120 miles south to Mendota. The Friant-Kern Canal was the scene of the greatest construction activity on the Central Valley Project during 1947. It will be about 160 miles long, and its capacity of 4,000 cu. ft. per sec. will be available for water flowing from Friant Dam to the arid and now almost waterless area in the southern end of the San Joaquin Valley.

COLORADO-BIG THOMPSON PROJECT

Nine years have elapsed since construction was initiated on the Colorado-Big Thompson project, and it is estimated that at least five more years must pass before the major elements of the project are in full operation. Progress was retarded by the war, and spiraling prices have increased costs; nevertheless, a vast amount of new work was started during 1947. With the completion of the project will come the realization of the pioneer dream of bringing western slope water to the eastern side of the Continental Divide in quantities sufficient for extensive irrigation.

The principal elements of the Colorado-Big Thompson project are: (1) Western slope storage facilities to capture excess waters of the Colorado River; (2) a 13-mile tunnel to bring these waters eastward under the Continental Divide; and (3) terminal storage reservoirs on the eastern slope foothills, along with distribution canals to provide supplemental water to land already under irrigation. The 13-mile Adams tunnel, longest tunnel ever driven from only two portals, was opened in June 1947. The major part of the construction during 1947 centered in three locations; (1) at Granby reservoir which stores excess water from the Colorado and its tributaries; (2) in the Estes Park area at the eastern end of the Adams tunnel; and (3) at the Horsetooth terminal reservoir which is one of three foothills storage reservoirs.

ANDERSON RANCH DAM

Except for minor construction, Anderson Ranch Dam was completed during 1947. Located on the South Fork of the Boise River, the dam will create a 500,000 acre-ft. reservoir, supply supplemental water for irrigation of 320,000 acres of land, provide power, and aid in flood control. Although not completed to full height until 1947, the dam provided water for irrigation of the Boise Valley during both the 1946 and 1947 seasons. The dam claims distinction as the highest rolled-earth fill structure in the world. It is 456 ft. high above foundation with a thickness at stream-bed level of 2,500 ft., requiring 9,078,000 cu. yd. of fill. The crest has a length of 1,400 ft. and a width of 40 ft.

DAVIS DAM

Continued progress was made on the Davis Dam project, which is the largest undertaking by the Bureau of Reclamation on the Colorado River since Hoover Dam. Work was resumed in March 1946, and it is hoped that by the latter part of 1949 the Davis power plant will be in operation. The dam is located in Pyramid Canyon near Kingman, Ariz. where it will serve to regulate the river below Hoover Dam, augment the power facilities in the Southwest, and fulfill the Mexican Water Treaty obligations between the United States and Mexico. The dam is a zoned, rolled-earth and rock-fill structure, 1,600 ft. long and 138 ft. high above the river bed, requiring 3,800,000 cu. yd. of earth and rock fill. The reservoir capacity will be 1,820,000 acre-ft. at a normal water surface which corresponds to the tailwater elevation at Hoover Dam.

Excavation operations on Davis Dam during 1947 revealed certain foundation weaknesses which necessitated some changes in the design of the intake structure, power plant, and spillway. The foundation weaknesses involved areas of severely jointed rock and zones along which the rock is decayed and crushed. In order to consolidate the foundation rock and increase its bearing strength and imperviousness, a thorough grouting and foundation treatment program was carried out.

GARRISON DAM

When completed during the next six or seven years, Garrison Dam will be the world's largest rolled-earth-fill dam, having a volume of 75,000,000 cubic yards and a reservoir having a storage capacity of 23,000,000 acre-ft. Most of the construction on the dam during 1947 was in the form of preliminary projects, including an access railroad, access highway, construction bridge, and construction town. The dam is located 75 miles north of Bismark, N. D., in an area not accessible by improved highway and railway facilities, which accounts for the large construction program prior to the actual construction of the main dam. Each of the four contracts—access railroad, access highway, construction bridge, and construction town—was awarded in 1946, but work was delayed by the shortage of critical materials to the extent that the completion dates for all four projects were extended well into 1947.

The first contract provided for the construction of 11.8 miles of railroad connecting the Soo Line Railroad with the construction town. The second contract for the construction of the access highway connects the U. S. Highway 83 with the construction town. The third contract for the construction bridge provided a deck steel girder combination highway and railroad bridge across the Missouri River at the down stream toe of the dam. The fourth contract, for the most part completed in 1947, was for the construction of the town of Riverdale, providing 80 temporary buildings with grading, roads, and utilities to serve the needs of an estimated 450 employees of the contractor and the Government during the initial stages of dam construction. Future contracts will expand the facilities of the construction town to serve the needs of 2,400 employees.

The construction bridge contains many interesting features. The bridge consists of 9-150 ft. spans supported on concrete-capped pile piers. In March 1947, two of the eight piers that had been completed in the fall of 1946 were subjected to extreme forces resulting from a severe ice jam during the spring breakup of the frozen Missouri River. The piers were undamaged, but it was found advisable to raise the bridge 10 ft. to minimize the possibility of damage in event of another severe ice jam. The increase in elevation was accomplished by increasing the height of the concrete cap, maintaining the steel piles and other construction parts as originally planned. Load tests on two piles indicated no substantial ultimate settlement for loads of 150 and 190 tons.

CHAIN OF ROCKS PROJECT

Various construction phases on the Chain of Rocks project on the Mississippi River near St. Louis progressed throughout 1947. The project is designed to improve the seven-mile Chain of Rocks reach which has interfered with river traffic from the earliest days. The average fall of 1.5 feet per mile in this reach has produced stream velocities exceedingly difficult to navigate. Furthermore, the navigable depth at extreme low water is reduced to approximately 5.5 ft., thus preventing full use of the improved 9 ft. waterway available above and below this section of the river.

It is estimated that at least four years will be required to complete the project. Plans call for 27,700,000 cu. yd. of excavation for an 8.4-mile canal with proposed locks containing 400,000 cu. yd. of concrete at the lower end of the canal. Two contracts underway as a part of this project, which received considerable advancement during 1947, were for the construction of a bridge over the future canal to permit relocation of U. S. Highway 66 and for the dredging of a pilot channel to provide water access to the lock site during the construction period.

WOLF CREEK DAM

The construction of Wolf Creek Dam on the Cumberland River, near Jamestown, Ky., progressed into the concreting stage during 1947. This rolled fill and concrete structure is a project under the U. S. Corps of Engineers and serves as a key dam in the flood control system on the Cumberland River. Reservoir capacity at the fixed spillway crest is 4,000,000 acre-ft. at a 168 ft. head. About 2,000,000 acre ft. of storage above the spillway crest is reserved for flood control. The amount available for power is 2,000,000 acre-ft.

BLUESTONE DAM

After a delay resulting from the war, the construction of Bluestone Dam on the New River near Hinton, W. Va., was resumed in 1946 and continued through 1947. The dam is a project of the U. S. Army Engineers, providing flood control and possible future development of power in a mountainous area of high runoff. This concrete gravity structure will have a head of 150 ft. and store 622,800 acre-ft. of water at maximum flood crest. Because the waters of the Bluestone Reservoir will flood some existing roadway, the West Virginia highway department has under construction the highest bridge in the state. The piers are 145 ft. high for this bridge, which is part of a general relocation of the highway in the area.

CONEMAUGH PROJECT

The U. S. Army Engineers' Conemaugh reservoir flood-control project on the Conemaugh River 30 miles east of Pittsburgh, Pa., is of interest because the cost of the dam and its appurtenances is estimated to be only about 30 per cent of the total cost of the project. Items in the project, other than the dam itself, will assume larger proportions both in the amount of work involved and cost of construction. The major projects incidental to the actual construction of the dam include 16 miles of railroad relocation and a 2,660 ft. double-track tunnel.

MUNICIPAL DEVELOPMENTS

Cities throughout the United States continued to announce long-range plans looking toward coordinated solutions of municipal problems. Major programs were adopted in an effort to alleviate problems of housing, business area construction, traffic and parking congestion, airport facilities, zoning laws, water systems, sewerage disposal methods, and many others. Only a few of the major advancements in municipal development will be mentioned.

New York City started work on the largest storm sewer in the world in suburban Queens. New Orleans approved a $23,500,000 bond issue to finance a new union terminal and other developments. Baltimore voted $39,500,000 for the construction of schools, an airport, sewers, a municipal stadium, and parking facilities. Los Angeles approved a $50,000,000 bond program to finance municipal projects and also started construction on the $43,000,000 21-mile Harbor Parkway. Cleveland started work on a rapid transit system for which $22,000,000 has been approved to finance the initial work. Philadelphia has construction underway on part of a subway extension program.

THE BROOKLYN-BATTERY TUNNEL

The Brooklyn-Battery Tunnel, under construction for several years, advanced considerably during 1947 toward its final completion date scheduled for 1949. A vehicular facility, the tunnel will connect existing and proposed express highways in Brooklyn with the West Side Express Highway and downtown Manhattan at Battery Park. The two 31-ft. diameter tubes have a length of 9,117 ft. portal-to-portal, passing under the main channel and a side channel of the East River. The original estimate of the cost of the tunnel made in 1939 was $80,000,000.

COLORADO RIVER AQUEDUCT

Construction was nearing completion on a 71.1-mile aqueduct which will carry Colorado River water from the Metropolitan Water District system at San Jacinto, California to the impounding reservoir of the San Diego City System. This $12,500,000 project was originally planned as a wartime emergency project to augment the existing San Diego water supply. Under the present plan established in 1946, the San Diego County Water Authority will reimburse the Federal Government annually until the true costs of the aqueduct have been repaid.

Concrete pipe used in construction of the aqueduct consisted of four sizes—48, 54, 72, and 96 in. diameters. All 48, 54, and 72 in. diameter sections were precast in 16 ft. lengths, while the 96 in. diameter pipe was manufactured in 12 ft. lengths. All the pipe was hauled to the site on trucks and trailers. The aqueduct contains seven concrete-lined, 6 ft. diameter tunnels of horseshoe-shaped cross-section varying in length from 500 to 5,350 ft. The character of the material encountered in the tunnel construction was largely blocky granite requiring no supports.

The aqueduct was designed to deliver initially half the amount of the 112,000 acre-ft. yearly storage in Lake Meade allocated to the City of San Diego. The tunnels were built to carry the entire allocated quantity when warranted by the demands. The increased capacity will require the installation of a second parallel pipeline between the reservoir and the tunnels.

THE MAINE TURNPIKE

The first phase of the Maine Turnpike, which may in the future extend some 450 miles from Kittery in the south to Fort Kent in the north, was completed and placed in operation during 1947. The 44-mile section opened to traffic in December connects Kittery with Portland. It is the first U. S. highway in nearly a century to be financed privately on the basis of anticipated revenues, with no subsidy from governmental agencies. Extension of the Turnpike will depend on the use and income of this first 44-mile section, and because it is the pioneer in the field of privately financed toll highways, it will be watched with interest by proponents of other similar projects.

The road surface for the Maine Turnpike is asphaltic concrete placed in three courses, having a total depth of 7 to 8 in. over carefully compacted supporting material. The road is a dual highway with two 24-ft. lanes separated by a constant width of 26 ft. Each roadway has a 4-ft. paved shoulder adjacent to the median strip and an 8-ft. paved shoulder along the outer side. The maximum gradient is 4 per cent, and the maximum curvature is 1 degree. Minimum sight distance is 525 ft. from a position 4.5 ft. above the roadway to an object 4 in. high on the roadway surface. Access to the Turnpike is limited to four traffic interchanges in the 44-mile length.

OTHER PARKWAYS AND TURNPIKES

A 486-mile throughway is being built from the New York metropolitan region up the Hudson River Valley and across the state to the Pennsylvania line. Construction during 1947 omitted small portions where large bridges must be built. Plans have been made for construction of the bridges as soon as the steel market becomes less critical. Access to the highway is denied from all abutting private property, and no intersections are at grade with other highways. Legislation, empowering the Department of Public Works to proceed with this construction, was passed in 1942. As a result of wartime restrictions, work was not actually started until mid-year 1946.

Construction is underway on a superhighway passing south of Pittsburgh and connecting with the Pennsylvania Turnpike at New Stanton, Pa. This toll-free, divided 4-lane highway crosses major mountains with a maximum grade of 3 per cent and only 38 curves in its 38-mile length. The road will not be limited in access. The grade separations and interchange ramps, provided at all intersections with important highways, involves considerable structural work. Several bridges will be built, largest of which will be a steel arch with a main span of 450 ft. over the navigable Monongahela River.

Another project underway at the western end of the Pennsylvania Turnpike is the Penn-Lincoln Parkway to connect downtown Pittsburgh with the William Penn and Lincoln Highways and the Pennsylvania Turnpike. The project will cost between $35,000,000 and $40,000,000 and will include four lanes, six interchange points, 34 bridges, and 4,225 ft. tunnel.

The State of New Jersey has started construction of a new highway which will ultimately become four separated two-lane roadways. This freeway designated as "dual-dual" highway is the first major attack on a traffic problem in northern New Jersey that is without parallel in the country.

The 476-mile Blue Ridge Parkway, when completed, will connect the Shenandoah and Great Smoky Mountains National Parks and provide a 573-mile scenic route from Front Royal, Va., to Cherokee, N. C. The year 1947 was the first full year of resumed construction on this parkway, which was started in 1934 as a Public Works project and temporarily stopped during the war years. Nearly all of the route is above 3,000 ft. elevation and in some sections rises to more than 5,000 ft. The parkway has presented a variety of interesting location problems because the terrain varies from gentle to very rugged, necessitating the use of numerous tunnels and bridges.

During 1947 the Public Roads Administration of the Federal Works Agency approved a 40,000-mile National System of Interstate Highways upon the recommendations of state highway departments. This vast road network will receive preferential treatment under provisions of the Federal Aid Highway Act of 1944. The system will serve directly 182 of the 199 U. S. cities having a population of 50,000 or over. In most states where projects on the system are planned, one-half of the cost of actual construction and up to one-third of the cost of the right-of-way will be financed by the Federal Government.

MECHANICAL ENGINEERING

By J. J. Jaklitsch, Jr.
The American Society of Mechanical Engineers

ATOMIC ENERGY

At midnight Dec. 31, 1946, control of the Manhattan Engineer Project became the full-time responsibility of a five-man civilian United States Atomic Energy Commission created by the Atomic Energy Act of 1946.

Atomic-energy research is to be conducted by a group of "national laboratories" operated under the direction of the Atomic Energy Commission. Five major centers of operation are to be established at New York, Santa Fe, Hanford, Oak Ridge, and Chicago. Each of the regional laboratories will direct contract research to be conducted at universities and each laboratory will be responsible for some phase of the atomic-research program. Brookhaven National Laboratory, Long Island, N. Y., and Argonne National Laboratory, Chicago, have thus far been approved as regional laboratories.

The status of atomic research centers now functioning or under construction are as follows:

Argonne National Laboratory, Chicago, oldest of the Commission's research centers, is operated by the University of Chicago with the participation of 29 midwestern universities and research institutions. Among its most important facilities are two experimental piles one of which is graphite-moderated and air cooled and the other is both moderated and cooled by heavy water. Another pile with unique characteristics is being built.

Clinton Laboratories, Oak Ridge, Tenn., formerly operated by the Monsanto Chemical Co., has been transferred to the University of Chicago. Here is located the largest experimental pile in the country. Further pile or reactor development is in progress. The newly organized Oak Ridge Institute for Nuclear Physics will provide sub-doctorate and graduate study for students from 14 universities in the southeastern part of the country. Clinton Laboratories are the source of most of the radioisotopes manufactured by the Commission. Production of these "tracers," invaluable aids in medicine, chemistry, biology, agriculture, and metallurgy, is an important peacetime activity of the Commission.

The Los Alamos Laboratory, N. M., although concentrating primarily upon the development of atomic weapons, is doing considerable work in fundamental nuclear physics. It has a low-power homogeneous nuclear chain reactor, or pile, utilizing enriched uranium in the form of a salt dissolved in water, and a "fast" pile, utilizing plutonium with no moderator.

The Hanford Engineer Works, Richland, Wash., is operated by the General Electric Co. It is one of the three original production facilities for the Manhattan Engineer District, and served as the plutonium production center.

The Brookhaven National Laboratory is now under construction on the site of Camp Upton, Patchogue, Long Island, N. Y. When completed it will be operated by nine northeastern universities. This Laboratory will have a low-power experimental nuclear chain reactor and other equipment especially suited to explore the interaction of nuclear particles. Training of advanced students in nuclear physics and allied fields will be an important function of the Laboratory.

Knolls Atomic Power Laboratory, Schenectady, N. Y., like Brookhaven, is in the early stages of construction. It will be operated by the General Electric Co. Its primary function will be the development of useful power from atomic energy for both the generation of electricity and the propulsion of ships. The laboratory will have extensive research facilities in the fields of chemistry, physics, metallurgy, and engineering.

Research facilities are also being erected near Miamisburg, O. and will be leased to the Monsanto Chemical Co. to carry on important research and development programs which were started during the war.

In addition, atomic energy activities are carried on in many other facilities, including the Radiation Laboratory of the University of California, Iowa State College, Ames, Ia., where government-owned research facilities are being expanded, the Battelle Memorial Institute, Cincinnati, Massachusetts Institute of Technology, and Columbia University.

In August 1947, shipments of radioisotopes, one of the most promising research tools in chemistry, biology, and medicine ever discovered, were exceeding 100 per month and almost 2,000 sales had been made. The majority of shipments went to hospitals and educational institutions.

An account of the atomic-powered ramjet conceived at Los Alamos was revealed by Dr. Richard P. Feynman of Cornell University. It would derive its heat energy from rods of a fissionable material such as uranium or plutonium.

The Navy Bureau of Ships has established an internal organization for the handling of nuclear matters, including studies of the possible application of nuclear power to ship propulsion.

Special photographic plates, known as "nuclear track" plates, developed by Eastman Kodak Co., are being used by scientists to picture actual atomic fission and to study highly charged nuclear particles.

AIRCRAFT, ROCKETS, AND GUIDED MISSILES

A wide variety of aircraft propulsion engines—gas turbines, jet engines, ramjets, and rockets—are in process of development. Also, the possibility of using atomic energy for powering aircraft is being investigated. Most of the research work now being done will probably be toward the development of extremely high-speed rockets, guided missiles, and military aircraft.

Projects in this area involve the investigation of the first man-carrying aircraft—the rocket-powered XS-1 and the turbojet-propelled Douglas D558—designed specifically to enter the transsonic speed range in level flight. To date the XS-1 has been limited to speeds of 0.8 Mach number or 8/10ths the speed of sound. On Aug. 25, 1947, the D558 established a new world-speed record of 650.6 mph. Outstanding among a variety of jet-propelled fighters and bombers announced during the year, is the successful test flight on Oct. 21, 1947, of the U. S. Air Forces first eight-jet bomber, the Northrop "Flying Wing." Also, on Nov. 24, 1947, the Air Forces' first swept-back jet fighter airplane, the North American XP-86, completed its initial test flight.

On Sept. 20, 1947, an experiment with automatic flight was conducted successfully when a pilotless Douglas C-54 landed at Brize Norton, England, after a completely automatic, 2400-mile transatlantic flight from Stephensville, Newfoundland. The C-54 made the return trip to Newfoundland also automatically, on Oct. 7, 1947.

Developments for equipment for all weather landing of airplanes continued to receive much attention in 1947, a year with many unfortunate aircraft accidents. Successful demonstrations were made with radar equipment for blind landings.

A new high in passenger comfort has been attained by the extensive use of large pressurized aircraft on the major airlines.

In co-operation with United Air Lines, Douglas carried out the first flights of a commercial airliner equipped with a heated wing under very severe icing conditions. Based on these flights and on previous data accumulated by the NACA and AAF, the CAA has recognized the use of heated wings instead of rubber deicers.

Kellett and McDonnell demonstrated new helicopters of much increased carrying capacity.

The advent of guided missiles has raised new problems in the field of aeronautics, such as the proper coordination of aerodynamic properties with the characteristics of automatic pilots for stabilization, the application of remote and automatic guiding and target-seeking devices, the development of suitable launching methods, and the determination of the dynamic and static structural requirements.

Typical of many of the guided missiles being developed is the "Tiamat," a 14-foot 600-lb rocket equipped with a seeking head, which reaches speeds of 600 mph. Another is a rocket named "Neptune," being built for test purposes for the U. S. Navy which, it is reported, will reach speeds of 8500 fps and will travel straight up to a height of 235 miles.

Aerodynamic research is also being directed toward airplane stability and control, aircraft engine installation, airplane propeller research, and rotating wing aircraft and spinning.

In addition a great deal of propulsion research, hydrodynamic research, structures research, and aircraft work is being carried on.

GAS TURBINES

Probably the outstanding event in the gas-turbine field during 1947 was the progress made in aviation toward the supersonic flight of aircraft, guided missiles, pilotless aircraft, and the like.

Progress in marine engineering has been made in the building of a gas turbine by the Elliott Company to go into a U. S. Maritime Commission ship in 1948. The British Admiralty has announced that the first gas-turbine watercraft has been taken to sea. It contains a 2500 shaft horsepower Metropolitan-Vickers gas turbine.

An outstanding event in the locomotive field was the announcement by the Santa Fe Railroad of its order of a 3750-hp gas-turbine locomotive from the Baldwin Locomotive Works, to be powered by an oil-burning gas turbine built by the Elliott Company. The Great Western Railway of England is now building two 2500-hp locomotives, one using a Brown-Boweri and one a Metropolitan-Vickers gas turbine. The railroad industry is also watching with interest the progress of the Locomotive Development Committees' plans for their coal-burning gas-turbine locomotives using both Elliott and Allis Chalmers gas turbines.

INTERNAL-COMBUSTION ENGINES

The general trend in the design of Diesel engines is to increase the operating speed in RPM, to apply supercharging such as exhaust-gas-driven superchargers, shaft-driven superchargers, or in the case of larger engines, motor-driven superchargers. The purpose is to increase the mean effective pressure per brake horsepower. With the higher mean effective pressure per brake horsepower resulting in a greater quantity of oil burned in the cylinders, more attention is being directed toward engine cooling.

The dual-fuel engine development is proceeding along the line of refinement, particularly in control. The complete control of both the pilot and the gas fuels may now be varied in any percentage from zero to 100 per cent gas with a small amount of pilot fuel for ignition purposes, to 50 per cent gas and 50 per cent fuel oil, or 100 per cent fuel oil.

With the exception of the dual-fuel engine, there is a definite trend toward a wider use of the solid injection system.

Fuel oil for Diesel engines is rising, due to an advance in crude oil prices. Freight rate increases and Federal and state taxes are also adding to the cost.

The trend in lubricating oil for Diesel and gas engines is definitely toward the inhibited types sold under various trade names such as Ring-free, etc. Very few straight mineral oils are available today.

It is interesting to note that the most powerful single-acting Diesel engine yet built in this country is being installed in a nitrate plant in Chile. With ten, 29 x 40-in. cylinders and a normal rating of 7100 hp, this engine drives a 500-kw 6600-volt, 3-phase, 60-cycle generator.

STEAM POWER

Between 16 and 20 million kw of new capacity must be added by 1951 to meet the post-war demands of the utility industry. Thus the record-breaking pace of adding 3.5 to 4 million kw each year for the next five years will launch one of the biggest construction programs in central station history.

Because of strikes, material shortages, and the like, construction in 1947 will fail to meet the growth by 300,000 to 500,000 kw. During 1948, however, new capacity is expected to exceed load growth.

Steam conditions are continuing on the upward trend. Many units are being built for pressures greater than 1200 psig with the most favored pressures ranging between 800 and 1000 psig.

Temperatures are reaching into the upper limits of present metallurgical possibilities with a concurrent slackening in the utilization of temperatures below 750 F. Three units designed for 1050 F have been reported. Temperatures of 900 to 950 F continue to be popular.

The largest turbine generators now being built are two 150,000 hkw units. The largest steam generators reported are two boilers of 1,000,000 lb per hr each.

Reflecting the effect of greater capacity flexibility on individual systems is the continued trend toward a single boiler per turbine designs. Furnace heat releases for all types of firing average about 22,000 Btu per hr per cu ft; for pulverized coal firing they average slightly less than 20,000 Btu per hr per cu ft. Of interest are two boilers reported to be fitted with cyclone burners similar to the experimental installation at the Calumet Station, of the Consolidated Edison Co.

Electric drive for auxiliaries continues with only a few exceptions where turbine drives were installed exclusively for boiler feed pumps.

The lowest heat rate so far realized with a steam cycle is expected to be realized with a 125,000-kw cross-compound steam-turbine generator for operation at 2000 psig, 1050 F initial temperature, and 1000 F reheat cycle, now being designed. This was reported at the ASME Annual Meeting, Dec. 1947.

Packaged steam boilers are now available in sizes ranging from 15 to 500 hp rating and for pressures from 15 to 200 psi, to burn light or heavy oil fuel, or in some cases, gas.

HYDRAULIC POWER

The year 1947 saw the resumption of a large number of new developments and additional units in existing plants which had been delayed during the war. For the first time in many years private installations exceeded those under government control. Construction work on these private generating plants was spread throughout the United States.

In addition to private industry, several government projects placed orders for generating equipment, among those being the Bureau of Reclamation, the Tennessee Valley Authority, and the U. S. Army Engineers.

The Idaho Power Company placed their Upper Salmon Development in operation during September. This plant contains two 11,800-hp turbines under 35 ft head. This company has under way four additional hydroelectric projects, the smallest of which contains one 12,000-hp unit.

Orders from foreign countries for hydroelectric equipment continued, units having been ordered from Norway, Chile, Brazil, and Finland, as well as several units for Mexico. In Russia, three replacement units in the Dnieper Plant were put into operation.

Activity in the field of large pumping equipment for use as an irrigation project and in conjunction with hydroelectric power developments continued. The Bureau of Reclamation placed orders for some large vertical pumping units. In South America, four pumping units were ordered with the capacity of 1,400 cu ft per sec under heads from 48 to 98 ft. All of these pumping units compared in physical dimensions with medium- and large-size hydroelectric units, some having casing inlet diameters as large as 13 ft. Lack of funds delayed the six 65,000-hp pumping units for the Coulee Dam irrigation district.

No new records as to capacity or efficiency of hydraulic turbines have been made, but many recent plant tests show turbine efficiencies from 93 to 94.5 per cent and over-all efficiencies from water to switchboard, including all turbine, generator, penstock, and intake losses, of 91 per cent or better.

RAILROADS

During 1947 the installation of Diesel-electric locomotives continued at an accelerated pace—especially in the United States. Extensive shipments of Diesel-electric locomotives to South America and Europe indicate the broadening efforts of foreign railroads to gain the improved service and efficient operation that have been experienced by many American railroads.

The American Locomotive Co. and General Electric Co. delivered new 70-ton 600-hp Diesel-electric locomotives to various domestic railroads. These units are designed for flexible operation and are being used extensively for branch-line service. The Baldwin Locomotive Works developed a new line of 1500-hp Diesel locomotives for various uses. A new line of 1500-hp Diesel road switchers were delivered to various domestic railroads by Alco-G. E.

Fairbanks-Morse delivered to several domestic railroads two new types of heavy-duty Diesels. The first is a 1500-hp unit designed for passenger, freight, and road-switching service, and may be equipped with a train-heating boiler. The second is reported to be the first four-axle Diesel-electric unit rated at 2000 hp and is being used for road-switching.

Several Diesel-electric locomotives designed for suburban passenger service by the Baldwin Locomotive Works were placed in operation by the Jersey Central Lines. The use of double-end operation cabs on each streamlined unit is featured.

Two single-cab motor-generator locomotives, said to be the world's largest, each a 360-ton 101-ft-long unit developing 5000 hp, were built for the Great Northern Railway for heavy mountain service, by the General Electric Co.

Seven 2-power locomotives were delivered to the Phelps-Dodge Corporation by Baldwin-Westinghouse. These locomotives, used in copper mines, can operate both under a trolley and on track not equipped with overhead construction.

Records of 29,000 miles per month per locomotive, established by several American steam locomotives during the year, indicate that technological improvement in steam locomotives coupled with better handling, servicing, and scheduling by the railroads have made significant strides.

A 4-6-2 steam locomotive rebuilt during the year by the Nashville, Chattanooga, and St. Louis Railway, included a completely new running gear and tender.

Four steam locomotives and cars for the Baltimore and Ohio Railroad's new "Cincinnatian" trains were built completely at the Mount Clare shops.

Five streamlined passenger steam locomotives for the Chesapeake and Ohio Railway were rebuilt at the company's Huntington shops. Originally having a 4-6-2 wheel arrangement, they were rebuilt into a 4-6-4 type. Only the tender and a part of the boiler were used in its reconstruction. The principal departure in design is the use of poppet valves.

An experimental coal-burning switching locomotive was rebuilt from an old 4-8-0 locomotive by the Norfolk and Western Railway in cooperation with the Standard Stoker Co. New features include mechanical lubrication, induced draft, and automatic control on the fan, stoker, dampers, and stand-by water-feed pump.

The latest application of the steam-turbine for locomotive use is exemplified by three non-condensing units which have been completed by Baldwin-Westinghouse for passenger service on the Chesapeake and Ohio Railway between Washington and Cincinnati. The arrangement of components is unusual in that the coal bunker is at the front, followed in succession by the operator's compartment, the boiler, and finally the turbine-generator power plant. Water is carried in a separate tender behind the locomotive.

There also have been some new and unusual developments in freight and passenger cars throughout the past year. Pullman-Standard designed and developed the P-S-1 box car. The principal feature is more parts standardization, which, it is hoped will speed box-car production and reduce costs. A new 40-ft 40-ton stainless-steel refrigerator car, built by the Consolidated Steel Company for the Atchison, Topeka & Santa Fe, was placed in experimental service. This car utilizes welded steel construction. Light weight is 57,200 lb. and load limit is 78,800 lb. Water ice is used as a refrigerant. Two aluminum refrigerator cars were placed in experimental service, one by Illinois Central and the other by Fruit Growers Express Co. The Illinois Central car is a 40-ton all-purpose car with a light weight of 51,500 lb. The Fruit Growers car was built for a 40-ton normal capacity and has a light weight of 50,600 lb.

The most significant departure from the conventional in passenger trains was the "Train of Tomorrow," built by Pullman-Standard for the General Motors Corporation. The train consists of a 2000-hp Diesel-electric locomotive, a coach, diner, sleeper, and a bar-observation car. A feature of the train is the "Astra Dome," a glass-enclosed observation roof on each car, rising about two feet above normal roof level. Many other new features adding to passenger comfort are incorporated in the train. Another adaptation of the "dome" idea is being applied by the Budd Manufacturing Co. to their "Vista-Dome" cars being delivered to the Burlington Lines.

The Locomotive Development Committee of Bituminous Coal Research, Inc., continued its activities in the development of coal-burning gas-turbine locomotives and is contemplating placing orders with two locomotive builders for pilot models. An order for an oil-burning gas-turbine locomotive for a domestic railroad is also being processed by one of the locomotive builders.

During the year, there were placed in service 23 all-welded boilers associated with rebuilt locomotives ranging from Pacific to Mallet types.

INSTRUMENTS

High-speed computing devices which appeared during the war are beginning to have an impact on regulating instruments, especially in connection with telemetering, which may approach that of the servomechanisms which matured in the Second World War. Components of aviation instruments are infiltrating the industrial instruments field, *e.g.*, the substitution of magnetic for electronic amplifiers and the increasing use of high-accuracy synchros for telemetering and telecontrolling, whether the receiver synchro be self- or servo-operated. Recent advances in the synchro art have raised their accuracy to a higher order.

Plans were completed for the establishment of one of the newest units of the National Bureau of Standards, the Institute of Numerical Analyses, at the University of California. A giant high-speed electronic computing machine is to be installed at the Institute.

A new instrument, the reflectogage, utilizing supersonics for thickness measurement and flaw detection, was announced.

An electronic instrument, a transmissometer, was developed for measuring atmosphere visibility and promises to be an important addition to airport safety equipment.

The mass spectrometer, one of the newer analytical instruments, has shown itself to be a remarkably useful apparatus in the analysis of gases and complex mixtures of gases.

A flow detector was developed for the continuous inspection of sheet material such as paper, mica, or plastics.

A pneumatic-type fatigue tester makes tremendously accelerated fatigue tests on not only test specimens of materials, but also on completed parts by vibrating them at resonant frequency at which lowest power is required, yet highest testing speed is realized.

A new torque meter was developed for the purpose of measuring torque transmitted by a rotating shaft at speeds of 35,000 rpm.

The hardness of microscopic grains within a piece of steel can now be measured by a new microhardness tester. The new tester can gage the hardness of a single steel grain at as many as three points within the breadth of a human hair.

Development of an electronic x-ray counter that accurately records x rays at millionth-of-a-second speed over a wide range of intensities was announced. An improved pyrometer for measuring the high-temperature high-velocity gas streams encountered in gas turbine and jet engines was developed. An electronic stop watch capable of measuring time intervals as brief as one thousandth of one millionth of a second was perfected.

Metal parts and stocks appearing alike but differing in composition are reported to be quickly and easily separated with a recently developed metals comparator.

Rocket exhaust flames that reach temperatures as high as 400 F can be measured with a newly developed instrument that passes a beam of light through the flame to a photoelectric cell.

MATERIALS

Widespread use of alloy steels containing nickel continued throughout the year. Engineering grades of triple alloy steels containing nickel, chromium, and molybdenum are also being widely employed. Low-alloy nickel-chromium-molybdenum cast steels are finding considerable use for parts operating at 950 to 1000 F.

The high volume of production of stainless steels continues. Based on the present outlook, production of 500,000 tons or more, is expected for 1947.

A high-temperature alloy, developed for jet-engine use, consisting of 20 per cent nickel, 21 chromium, 21 cobalt, and the remainder mostly iron, will endure a stress of 15,000 psi at 1500 F without excessive creep. Another alloy of 60 per cent chromium, 25 molybdenum, and 15 iron is even stronger at 1600 F but it is too difficult to produce commercially at present because of its high melting point.

A wide use of nickel and high nickel alloys such as Monel and Inconel, continue to be found in the power, chemical, and associated fields.

Corrosion, heat, and wear-resisting austenitic cast irons, known as Ni-Resist, are finding increased applications as cylinder liners and valve guides for internal combustion engines, in chemical equipment, heavy-duty commissary ranges, pipe, glass molds, and bolts.

Low-expansion wear-resistant nickel cast iron is in increasing demand for precision machine tool and instrument parts.

A new 33 per cent cobalt, 64 per cent iron, 1 per cent chromium alloy, said to carry more magnetism than any other alloy practical for use in motors and generators, and tough enough to withstand intense vibration, was developed.

Wartime research has resulted in the development of two processes for producing aluminum from kaolin clay, one a hydrochloric-acid extraction process, the other an alkaline extraction with a solution consisting of a mixture of sodium hydroxide and sodium chloride.

All-crystalline porcelains, capable of withstanding temperatures of 2000 F, were made from alumina, beryllia, zirconia, and thoria.

A concrete known as "Kaocast," which, it is claimed, can withstand temperatures as high as 3000 F, was developed.

A space saving insulation material, called "Santocel," is said to increase refrigeration and freezer capacity up to 60 per cent without adding to outside dimensions.

Silicones are becoming more important. Silicone oil which maintains a fairly uniform viscosity over extremely wide temperature limits will probably be useful in aircraft hydraulic systems as well as for lubrication of bearings, which are subjected to great temperature changes.

RUBBER

National legislation has authorized the continuation of the wartime industry controls until March 1, 1948, so that permanent legislation could be prepared which would establish a long-term policy on rubber as a national security measure. The consumption of natural and synthetic rubber continued at a high rate during 1947. Free commercial trading was resumed in natural rubber and increased quantities were available.

The development of a new chemical industry, capable of producing synthetic rubber at a rate of 1,000,000 tons per year was described.

Improved processes for the preparation of crude rubber were developed which employ continuous coagulation of hevea latex. A continuous process was developed for the isolation of GR-M from latex.

The use of rubber parts in springs for commercial vehicles increased. The use of butyl inner tubes is claimed to result in increased tire life. Tires containing wire-cord reinforcement were produced on a commercial scale and proved advantageous in off-the-road service. Experimental tires were built using glass-cord fabric as the reinforcement.

Injection-molding procedures were developed for the production of large parts, and an improved method devised for molding printing plates.

Advances in latex technology resulted in the development of a wide variety of new applications such as binders, and impregnants for fibrous materials, rubber linings, and coatings for the protection of metal equipment have expanded. Improvements in the properties of high-temperature resistant synthetic compositions have widened their use. A method has been developed for the precision machining of rubber parts by freezing them.

There is an increased interest in the testing of rubber products and a noticeable trend toward the experimental evaluation of finished products under simulated service conditions.

Wood cellulose and lignin were investigated as corresponding ingredients for rubber, and phenolic resins are reported to improve the oil and heat resistance of synthetic-rubber compositions and to increase their tensile strength and hardness.

PLASTICS

One of the most startling announcements during 1947 was that plastics were being used as drugs. It has long been known that excess acidity in the stomach was a direct cause of stomach ulcers. Since ion-exchange resins have been known for many years, it is perhaps only the commendable caution of physicians in not publishing results of medical research until thoroughly checked that has kept this announcement from publication until lately. An interesting part of this announcement is that the hydrochloric acid adsorbed by the resin in the stomach is released in the intestines to be returned to the body system.

Another announcement that revealed an unusual property of plastics was that when an electrical potential is applied to transparent plastics the strains created prior to dielectric breakdown can be viewed by polarized light in the same way as is possible to view strains created by mechanical forces.

Powder metallurgy techniques are being used to mold polytetrafluoroethylene, it was reported. By this new technique, finely powdered polytetrafluoroethylene is pressed into a compact in the same way as is used for making powdered metal compacts.

It was revealed that during the war, because of a shortage of solvents in England, polyvinyl chloride pastes were developed which contain no solvent.

A method of continuous compounding of thermosetting molding compounds was revealed in an article reporting on German practices.

Articles in both American and British publications indicate that steam preheating was independently developed in both countries. Results indicate that the properties of molded parts made from steam preheated preforms are about equivalent to parts made from dielectric preheated preforms in all but electrical properties which rules out steam preheating for electrical parts.

Although several companies announced new modifications of old materials such as Plexiglas Special UVA, a polymethyl methacrylate able to absorb ultraviolet light; Plexiglas V, a polymethyl methacrylate having a heat distortion temperature of 87 to 88 C; and Tenite III, a cellulose acetate propionate; only one entirely new material was offered to the trade. This new material was diallyl phenyl phosphonate. As with all monomers containing two allyl groups in the molecule, it polymerizes to form a thermoset resin and is capable of conferring this property on copolymers containing it in sufficient quantity. Other properties of the polymer of diallyl phenyl phosphonate which make it appear promising are its high index of refraction, its ability to wet glass fibers, and its flame resistance. The index of refraction is 1.57 so that as a transparent solid it is exceeded only by the flint glasses and polystyrene.

Silicone resins have been found to be excellent for sizing paper. Less than 0.1 per cent resin is necessary to give good results. It is added to the beater stock which must have a pH value below 7. Hard water decreases the sizing effect, but this can be overcome by the addition of a small amount of silicone oil emulsion. This small amount of size does not affect the strength properties.

FUELS

The general shortage of materials applied also to the fuel supply, which in turn contributed toward shortages of other items, notably coal cars, which were frequently in so short supply that mines could not be operated at capacity. A sizeable portion of United States coal production went to help revive European industry.

A gas which could be used in manufacturing synthetic liquid fuels has been produced successfully by setting fire to one section of an underground coal mine. The experiment is being conducted by the Bureau of Mines and the Alabama Power Co. at the Gorgas Mine near Jasper, Ala. The experiment did not encounter as many difficulties as had been expected, and demonstrated that, for certain logical formations, a gas of rather low heat value could be produced. Experiments will continue.

Distribution of natural gas from the Texas fields to the Eastern Seaboard was greatly increased by conversion of the wartime "Big-" and "Little-Inch" pipe lines, but the supply was still insufficient to meet the demands of the growing economy.

New discoveries of U. S. oil and gas reserves continued to fall short of unprecedented consumption rates. The consequent importance of coal as the basic energy source was emphasized by the announcement of a program to develop means for reproduction of synthetic liquid and gaseous fuels by the newly formed Pittsburgh-Consolidation Coal Co. in cooperation with Standard Oil Company of New

Jersey. This will supplement the work of the U. S. Bureau of Mines begun some time ago.

The importance of cheap oxygen to the production of high-heat-value gas was widely discussed. The cost of oxygen, though lower than ever before, was still too high for this purpose, but some plants under construction were expected by their builders to reduce the cost to an economic point.

Progress was made on pilot plants for the generation of electric power from the energy of controlled nuclear fission being developed by the U. S. Atomic Energy Commission, but many problems remained to be solved. It was generally conceded that many years would be required to make power in important quantities by this method.

Investigation of a systematic nature on pulverized coal applied to the gas turbine revealed for the first time that combustion of this fuel is unaffected by pressures up to seven atmospheres. This was reported at the ASME Annual Meeting, December 1947.

Study is continuing on the use of higher blast furnace top pressures in relation to improvement in distribution of ascending gases and more regular operation.

Coal washing practices are being continually studied and improved to effect removal of ash and sulphur from raw coal to produce lower sulphur coke with resulting improvement in blast-furnace operation and pig-iron quality. Blending of different grades of coals to provide suitable mixtures for use in by-product coke ovens is continuing.

Improved blast-furnace gas cleaning methods were studied and applied, notably the new disintegrator type of washer in which air aspirated by high-pressure water is thoroughly mixed with the dirty gas. The use of oxygen as an addition to the blast was under continuing study during 1947. Also, the use of oxygen as an aid to combustion and as a reagent for rapidly removing carbon from the open hearth bath continued to receive attention.

HEAT TRANSFER

The ASME Heat Transfer Division made the following contributions to the field of heat transfer during 1947: A program of basic research aimed at discovering the details of flow and heat transfer in complex industrial heat exchangers was initiated. A program of research has been proposed for the determination of the fundamental thermodynamic, heat transfer, and flow properties of important industrial gases. The subject of anti-icing of aircraft has been given further study. Designs of high-performance heat exchangers for application to gas turbines were proposed. Heat transfer and pressure drop for evaporating and condensing vapors were studied. The numerical solution of heat-transfer problems by the so-called "relaxation" method was investigated further.

MANUFACTURING TECHNIQUES

Under the impetus of the high speeds and heavy feeds of carbide cutting tools, the machine industry has turned to more rigid machines, a greater acceptance of fly-wheels on milling machines, and extended use of electronic controls.

The general trend in advanced design was demonstrated by the exhibits at the NTBA Tool Show held in Chicago. The same trend was emphasized by the subjects discussed at the ASTE meeting in Boston.

Additional impetus has been given to new design through increasing labor costs and the necessity of proportional increase in production by the development of specialized machines of a highly automatic nature. Down time still remains an important factor in machining costs, and new designs tend to loading and unloading without interruption of the machining cycle.

Relatively few new machines have been developed, the tendency being to embody progressive operations in a single machine. In many cases, operations that formerly required the transfer of parts from one machine to another are now performed on a single machine.

An increasing tendency toward weldments for the replacements of castings is in evidence. Where formerly welding design followed very closely the design of cast machine frames and beds, welding design has now become a specialized art. Through analysis and study, designs have been developed which, by proper placement of braces, produce the same rigidity and lack of vibration found in castings at a material saving in weight and in cost. The square corner, originally a feature of weldments, is giving way to roll edges at the point of weld with the result that these weldments have a smoothness of line equivalent to that of castings.

Contour turning is becoming of more importance in the machine industry. Rather intricate shapes, which formerly required a high degree of skill on the part of the operator, are now being performed by this means.

APPLIED MECHANICS

The significant developments in applied mechanics during 1947 were the continuous progress in connection with gas-turbine and jet-engine developments for ship, locomotive, and aircraft propulsion.

Preliminary plans have been completed for publication in January 1948, of the first issue of *Applied Mechanics Reviews,* a critical review journal of the world literature in applied mechanics. It will be published by The American Society of Mechanical Engineers with the cooperation of The Office of Naval Research, American Society of Civil Engineers, Institute of the Aeronautical Sciences, Society for Experimental Stress Analysis, Illinois Institute of Technology, The Engineering Foundation, American Institute of Physics, American Mathematical Society, The Institution of Mechanical Engineers, and The Engineering Institute of Canada.

REFRIGERATION AND AIR CONDITIONING

Because of the large existing backlog of orders for various types of equipment, development work by manufacturers has been greatly retarded as they have been required to devote their energies to reconversion to peacetime activities and filling orders for standard apparatus.

The impetus given to refrigeration through its use by the Armed Forces has been reflected in this backlog of orders. In addition, the manufacture of domestic refrigerators and air conditioning for comfort cooling was entirely prohibited during the war. This condition has been further accentuated by an acute shortage of material caused largely by strikes in the coal, steel, copper, electrical, and other industries.

Despite these handicaps, accompanied by spiraling costs of labor and material, the refrigeration industry has increased rapidly in size. The increased demand for frozen foods induced an unusually large number of manufacturers of food freezers to enter the field with the resultant number of mortalities. The necessity for transportation of frozen foods has resulted in greatly increased interest in and demand for refrigerated trucks, trailers, and freight cars. It is estimated that more than 500,000 low-temperature units will have been produced in the year 1947 for use in some phase of the frozen-food business.

The manufacturers of mechanical domestic refrigerators realized that the household unit of the future must contain a compartment for holding frozen foodstuffs. Practically every manufacturer will have a refrigerator with a freezer compartment. Several models are already on the market.

The reverse refrigeration cycle or the heat pump, while not new, has commanded considerable attention. This type of system permits heating as well as cooling. Efficiency is such as to be practical, and investigations have been spurred on by increasing costs of some common fuels. The potential field seems to be largely in residential and small commercial cooling and heating applications.

Air conditioning for comfort cooling prohibited during the war is now being provided by a large number of manufacturers by the familiar room coolers as well as remote systems. The development of the centrifugal type of compressors, particularly for large installations or, specifically, where each compressor is required to compress a large volume of refrigerant, has progressed rapidly, and several firms are now manufacturing this type of equipment.

A nation-wide field survey made among architects, pipe suppliers, heating contractors, and engineers, and an analysis of the sales records of wrought-iron radiant-heating pipe reveals that in 1947 there were upward of 10,000 radiant-heating installations in the United States. These include homes in all price ranges, and commercial, industrial, and institutional buildings.

A nine-story student apartment building under construction on the campus of the Georgia School of Technology, Atlanta, Ga. is to include one wing which will be heated by means of wrought-iron pipe coils embedded in the concrete floor slabs.

The Army Air Forces climatic hangar at Eglin Field, Fla., was placed in service during the year. The building provides a main test hangar 250 ft wide by 200 ft deep with overhead clearance of 60 ft in the central portion, and an engine test room 30 ft by 80 ft. The test hangar is designed to produce and maintain any desired temperature between minus 70 F and plus 165 F, and any desired humidity between 10 per cent and 95 per cent consistent with a maximum vapor pressure of 1.5 in. of mercury.

METALS ENGINEERING

Marked progress has been made in the development of instruments and control devices for continuous hot rolling, cold reduction, shearing, coating, finishing, and inspection equipment for flat-rolled steel products. Electronic devices of new design are being utilized in the control of these high-speed continuous operations. Speed of temper rolling was increased during 1947 by discarding manual measurement of extension during rolling for a continuous, electronically operated meter which compares the entering end speed of the strip with the difference between the entering and exit speeds to provide a direct measurement of the percentage of extension.

During 1947, the first detailed report on the stretch-reducing rolling process for the production of seamless pipe in small diameters was presented. This special technique is the nucleus of a large, new seamless pipe mill now under construction by a United States Steel Corporation subsidiary.

While no basically new discoveries were made in the field of heat-treatment, increased attention has been given to the application of existing knowledge to improving methods of specification for heat-treatable steels, using the hardenability concept as a basis for the new classification. The importance of hardenability has been recognized in establishing limits in the form of hardenability bands (so-called H bands) which in heat-treating problems are coming to be recognized as being more important than a rigid adherence to narrow chemical specifications.

The year 1947 saw continuing research carried out on the mechanical properties of steels, their response to heat-treatment, the problems of flow and fracture conditions and especially to behavior under multiaxial stresses.

The mechanics of sheet-metal forming have received more intense study by a new approach based on the fundamental material properties, especially in so far as they may involve flow under multiaxial stresses.

MATERIALS HANDLING

Work on the establishment of pallets standards with government agencies, transit associations, and industry in general is still progressing. The governing factors in connection with standardization of pallet sizes will be limitations established by transit media.

Some new developments in electric industrial trucks include a motorized boom attachment for use in railroad service shops and roundhouses; a clamp attachment for handling loose plate; a special handling device that can handle loads without pallets or skid platforms or using cardboard, fiberboard, or similar expendable materials as a platform. Another design in progress is for a clamp attachment which will automatically pull an unpalletized load onto the forks and push it off the forks in a storage area boxcar. Equally important has been the development of sparkproof and explosion-proof trucks for use in hazardous operations, or areas.

TEXTILE INDUSTRY

Progress during 1947 was made in the textile industry through a greater use of better dyes, drawing-in equipment, and development of synthetic fibers and filaments. In the woolen and worsted branch of the textile industry there has been a decidedly greater use of automatic looms and a new larger carding machine has been introduced.

In the cotton branch advances were made in opening and cleaning machinery, one-process drawing, and special reworking and revamping of spinning spindles.

Interesting developments in textile engineering during the year included the following: Revolutionary principles were applied in a Swiss weaving machine developed by Sulzer Bros., Winterthur, Switzerland. Basic principles of the automatic loom provide for introduction of the woof or filling yarn by means of a gripper which draws the filling thread from a single "cheese" of yarn. The small steel gripper obviates the necessity for bobbin winding and the use of a shuttle which rides on the yarn in other looms. The gripper never comes in contact with the warp yarns, since it is shot through a series of guides which are introduced between top and bottom sections of the warp when the shed is open.

A "Pneumafil" broken-end collector, for ring spinning frames was developed by Luwa Ltd., Zurich, Switzerland. The underclearers are eliminated and when an end breaks the clean drafted roving is conveyed into a filter chamber at one end of the frame.

The 2 for 1 twister, in which each spindle is driven by a 2-pole 3-phase vertical induction motor, rated at 40 watts, 12,000 rpm, 60 volts, and 200 cycles was introduced. Its present use is primarily for high-twist fine-denier rayon and nylon.

The continuous Hydrogen Peroxide Bleaching Range, using either the DuPont or Becco Process with cloth in rope form or open width and the continuous vat dyeing range, were further developed. Both ranges are said to be more economical than the conventional system when production is sufficient to keep them in fairly steady operation.

Peralta Rollers, for woolen cards were developed. These are of particular advantage in processing blends containing vegetable matter, hard threads, and skin. By their use a better yarn is produced and the number of ends down on ring frame is reduced by 20 to 70 per cent, depending upon the blend.

A pneumatic device for regulating and controlling the pressure applied to the rolls and packing boxes of a fulling mill was designed. This method of applying pressure suitable for the cloth being processed is reported to be superior to the conventional method of weights and springs.

STANDARDIZATION

Work on standardization and unification of screw threads, being carried on by the United States, Great Britain, and Canada, continued during the year. The American Standards Association Standards Council approved the initiation of a new project on Colors for Industrial Apparatus and Equipment. The following new

American Standards in the mechanical field were approved in 1947: Brass or Bronze Screwed Fittings, 125 lb, B 16—1947; Surface Roughness, Waviness, and Lay, B 46.1—1947; and Machine Pins, B 5.20—1947.

ELECTRICAL ENGINEERING

By Harry Sohon

Assistant Professor, University of Pennsylvania

MEDALS AND PRIZES

The Edison Medal was awarded to Lee de Forest at the winter meeting of the American Institute of Electrical Engineers in January 1947. The medal is a yearly award founded in 1904 by some friends and associates of Thomas A. Edison. The 1946 medal was presented to Mr. de Forest "for pioneering achievements in radio."

Dr. Vannevar Bush was awarded the Hoover Medal for 1946 by the four national engineering societies. Dr. Bush is noted for his work in the fields of education and research.

The Lamme Medal was presented to John B. MacNeill of the Westinghouse Electric Corporation "for his foresight, leadership, and creative contribution to the development of switching equipment." The award was made at the meeting of the American Institute of Electrical Engineers held at Montreal, June 11, 1947.

NEW PROJECTS AND PLANS

The Hartford Electric Light Company is starting a $12,000,000 program. This is to include the installation of a new 45,000-kw steam generating unit and rebuilding the South Meadow mercury-turbine unit. The changes at the South Meadow station are expected to increase the capacity by 10,000 kw and save $300,000 worth of fuel per year. The cost of the improvements on the mercury turbine unit is expected to be $2,000,000.

The Public Service Company of New Hampshire is planning to build a 40,000-kw, combination mercury-vapor and steam turbine generating plant at Portsmouth. There will be two 26,500-hp boilers supplying two 10,000-hp mercury turbines, and one 33,000-hp steam turbine. Each mercury turbine is to drive a 7,500-kw generator, and the steam turbine will drive a 25,000-kw generator. The mercury boiler is to operate at 128 pounds per square inch and at 962 degrees F. The exhaust mercury vapor from the mercury turbine will be condensed in a heat exchanger that generates steam at 643 pounds per square inch and 825 degrees F to drive the steam turbine. The condensed mercury will be used over again. The cost of this installation is expected to be about $5,000,000. The cost of the mercury alone will be in the neighborhood of $200,000.

The Potomac Electric Power Company is to build a $10,000,000 steam generating plant at Alexandria, Va. The capacity of the plant is to be 400,000 kw.

The Public Service Department of Burbank is entering upon an improvement plan, to cost $6,000,000, which will double its capacity. The load now carried is 14,000,000 kwhr monthly.

The Electric Power Board of Chattanooga is planning to expand and improve its system at a cost of $1,800,000. Improvements are to be made all along the line rather than on one or two large items.

Otter Tail Power Company at Fergus Falls, Minn. is raising its capacity. An investment of $3,000,000 is planned. Additional units are to be placed at several plants, including Devils Lake, Jamestown and Wahpeton, N. D., also Crookston, Hook Lake, Hallock, and Perham, Minn. The plan also includes the increase in the transmission voltage from 7,000 to 41,600.

The Commonwealth Edison Company is planning to add a 150,000-kw turbo-generator to its Fisk plant in Chicago. This will raise the capacity to 473,000 kw at a cost of $15,500,000. The new boiler will burn coal for fuel.

The Alabama Power Company is planning a new plant near Godsen. There will be two 120,000-kw units. The steam boilers will be able to use either coal or natural gas as fuel.

Dollas Power and Light Company is expecting to start a $5,000,000 expansion program. This includes a 40,000-kw steam driven unit at Mountain Creek.

Texas Electric Service Company is constructing a 25,000-kw steam plant in the Permain Basin. Natural gas is to be used as fuel. Condenser water is to be obtained from wells and will be cooled in towers and used over again.

The Southern California Edison Company is changing its frequency from 50 cycles to 60 cycles. The cost of making the change will be nearly $30,000,000 and the time required two years. In addition to converting the generating equipment to the new frequency, there is the problem of converting instruments and customer equipment as well. Even individual customer's washing machines must be adjusted to run at the new frequency.

MACHINES

A compact 400-cycle motor-generator set is now available. A 14-pole generator, running at 3440 rpm, generates 400 cycles and is rated at 1 kva. The driving unit is on the same shaft and is a 4-pole d-c motor. The overall efficiency is 50 per cent and regulation about 7 per cent at unity power factor. The unit is about two feet long by one foot in diameter. Its compact size makes it a very desirable power plant where calibration and development work is carried out on 400-cycle equipment.

An axial-air-gap motor has been made commercially practical. The principle is not new, however, the difficulties expected in construction have prevented manufacturers from attempting it. The new motor has about three times the fly-wheel effect, and where fly-wheels would naturally be used, such as punch presses, there is this advantage. The motor compares with conventional types except that friction and windage may be higher. The new motors are advantageous where space requirements are limited.

ROTARY CONVERTERS

The electrolytic zinc plant of the Anaconda Copper Mining Company at Great Falls, Montana was supplied with direct current by rotary converters. In order to increase the plant output it became necessary to obtain more d-c power. The least expensive solution to the problem was to place a grid controlled rectifier in parallel with each rotary. The operation of a rotary converter is entirely different from the operation of a rectifier. Therefore, it became necessary to provide controls to assure that the load be divided in the proper proportions. Furthermore, it was necessary to ensure that a fault in the rectifier would not communicate itself to the rotary and destroy the commutator before the operation of protective breakers. The rectifiers were provided with phase control so that there was a 25 per cent voltage adjustment possible. Circuit breakers were placed in each anode lead of the rectifiers and an interlock with the cathode breaker ensures that no rectifier is working with any anodes out of service. Current regulators are placed on each rectifier so that it carries a constant load and the rotary carries load variations. This set-up, where rotaries and rectifiers are working in parallel, has proved to be completely satisfactory. It indicates that the two devices can be used in parallel for many applications, as long as appropriate control equipment is provided.

TIDD TEST PROJECT

In order to increase economy of power transmission the tendency is to go to higher voltages. Lines operating at 220 kv have been in use for some time. To go to higher voltage will pose many new problems on the engineering profession. Recognizing that this is a problem for the profession rather than for individuals or individual companies the Tidd test project has been organized. The American Gas and Electric Service Corporation invited a number of manufacturers to cooperate in a research and test program on extra-high voltage power transmission. The Westinghouse Electric Corporation contributed the power transformers, lightning arresters, and measuring equipment. The American Bridge Company contributed the towers. The Ohio Brass Company and the Locke Insulator Corporation supplied the insulators and hardware. The conductors were supplied by the Aluminum Company of America, General Cable Corporation, and Anaconda Wire and Cable Company. The General Electric Company is supplying an oil circuit breaker and arrester. Tests are planned at voltages up to 500,000 volts line-to-line. Various types of insulators and conductors will be tested. Wire spacing and locations will be studied, and the operation of lightning arresters and circuit breakers at high-voltage will be studied, to see whether present design can be extended to cover the new range or whether an entirely new design is needed.

ELECTRONIC STABILIZER

An electronic stabilizer for power transmission has been developed. It has been known that a high-speed exciter will help keep an alternator from falling out of synchronism during the period of short circuit before the breakers open. This is a plan that can be used on the generator in the power plant, but is not applicable on the line. The equivalent of a high-speed exciter on the line is obtained by the new scheme. Grid-controlled rectifiers are used to draw exciting current through reactors. By controlling the current in the reactors the line voltage can be varied over a range so that the device can be used to actually hold the line voltage constant while the load varies. In case of a fault appearing on the line the rectifiers are cut out immediately and the necessary exciting current is available to keep the machines in step until the fault has been isolated by the breakers.

MAGNETIC AMPLIFIER

There are many control problems where amplifiers are necessary. Where the amplifier is used to actuate a contactor, an on-off type of control, a type of amplifier that may come into common use is a magnetic amplifier. Its operation depends on the variation of the incremental permeability of steel with the amount of constant polarizing flux. A small amount of direct current in the input coil changes the inductance of the a-c coil wound on the same core. This unbalances an a-c bridge and an alternating-current output is obtained. If this is rectified it can be fed into a second similar stage. By using three stages, very high amplification can be obtained. This is done without any thermionic tubes. The equipment consists of coils and dry disc rectifiers. Since there are no tubes there is no danger of burn-out which makes the amplifier much more reliable than otherwise. With no cathodes to heat, the efficiency of the amplifier is considerably increased over conventional types. The magnetic amplifier can be used for on-off operation and for rather slowly changing signals; it could not be used for speech and music in its present form.

ELECTRIC STEERING OF SHIPS

There has been a tendency to adopt electric steering of ships by foreign companies. The trend in this country has been a combination of electric-steam or electric-hydraulic systems. The fact that some foreign-built ships are operated by domestic firms and that foreign ships sometimes require servicing in domestic ports makes a knowledge of the electric system of interest to the engineer. A three-unit motor-generator set is used to supply power to the motor that actuates the rudder. In addition to the motor, there is a generator and exciter on the same shaft. The exciter armature is connected directly to the generator field, and the generator armature is connected directly to the rudder-actuating motor. All of the control takes place in the exciter field where currents and voltages are low. The steering wheel works a multipoint switch. This varies the excitation of the exciter. The rudder drives a followup that is a multipoint switch also. When the two multipoint switches are making contact on corresponding points there is no flux in the exciter field and no rudder motion. When the steering wheel is turned the rudder does not turn through its full range unless the wheel was turned to its extreme position. A small turn of the wheel produces only small rudder motion. The main advantage of this over domestic equivalents is that switching is done at low levels in the exciter field circuit instead of with high-current contactors in the rudder-motor circuit.

MEASUREMENTS

On Jan. 1, 1948 the "absolute" system of units became the standard for the electrical engineering profession. These units differ from the "international" units that preceded them by very small amounts, of the order of five parts in ten thousand for resistances. The units in the absolute system are derived from the magnitudes of the meter, kilogram, and second by accepted electromagnetic laws and the assumption that the permeability of vacuum is 10^{-7} in the MKS unrationalized system. The effect of the change to the new units will be apparent in only very few instances. The ordinary laboratory portable instrument correct to one quarter per cent would not be able to indicate the difference between the two systems.

When making oscillograph studies it frequently develops that there are not enough elements to indicate all of the quantities that one wishes to record. The following scheme has been suggested for indicating all three phase voltages with one element. The element is connected through a three-phase rectifier circuit so that it indicates the greatest of the three voltages. This gives enough of the voltage wave to indicate the magnitude and a fairly good approximation to the phase position of each wave. Of course, if the harmonic content is required, then it is necessary to record the entire wave, but where magnitude and phase position are the important quantities this scheme has been found very useful.

An electric alarm system has been made available that is actuated by any of 15 thermostats. These thermostats can be adjusted to sound the alarm when the temperature is raised above the set value by a fire, or the device instead can be used to indicate a freezing temperature. When any thermostat signals that it has been actuated, a green all-clear light is extinguished and a red danger signal is turned on, a horn sounds, and a pointer indicates which of the 15 thermostats is indicating trouble.

A method of metering electric power is being introduced where the power is supplied directly to the customer's transformer. The instrument transformers required to make the measurements on the line side are quite expensive; on the other hand, if the metering is done by conventional methods on the low-tension side of the transformer, the transformer losses are not included in the load reading. The new method consists of placing the meters on the low-tension side and compensating the circuit so that the transformer losses are included in the readings. A compensating voltage proportional to the load current is added to the measured voltage. This causes the meter to include in its reading the copper loss of the transformer bank. A compensating current proportional to the voltage is added to the current to make the meter include the iron loss in its reading. The correction for the copper loss is very accurate over wide values of current because the copper loss is a current-squared loss. The iron loss is not a true volt-squared loss and hence the correction is good for only a small range of voltages. However, in these circuits the voltage is confined to a rather small range in values and the correction is very satisfactory in practice.

DUST PRECIPITATOR

A dust precipitator for use in the home is now available. It is used in the input to a hot-air furnace or the input to an air-conditioning system. It has a capacity of 1,200 cubic feet per minute, and a demand of 50 watts. The principle is similar to that underlying similar devices of larger size. The air passes through an electrostatic field where the dust particles are charged. It then passes plates that are charged to attract the charged dust particles. These plates can be removed periodically and cleaned by washing with water.

High-speed x-ray photography has been developed so that exposure time can be reduced to one millionth of a second. This type of photography has a very valuable application in the study of exploding shells and similar applications. So that the x-rays will be intense enough to effect the photographic emulsion at this high speed an electron current as high as 1,000 amperes is required.

BETATRON

The betatron has been brought to a rather advanced stage of development. The present design uses a 130-ton magnet. The device is similar to a transformer with a ring-shaped vacuum tube for secondary. As the flux produced by the primary current varies, an electric field is produced that causes the electrons in the wire on the secondary of the conventional transformer to move along the wire. Because of the atoms of which the wire is composed, the current electrons do not move very fast. In the betatron the electrons are released in the tube, the changing flux causes the electrons to move around the ring, and with no atoms to interfere the electron speed is enormous. The electrons are accelerated during one quarter cycle of the 60-cycle magnetic field. The velocities attained by the electrons correspond to 10 to 100,000,000 volts. The power required to produce the magnetic field is about 200 kw, but since the exciting current is a quadrature current, the magnet requires the 200 kw at 24,000 kva; consequently, a 24,000-kva capacitor is used so that the betatron input is nearly a unity power factor.

WIRE DRAWING

The wire-drawing art has progressed almost to an extreme. Wire can be drawn so fine that it can not be seen. Tungsten wire has been drawn to 0.00018-inch in diameter. The wire is invisible to the unaided eye and consequently can not be gaged by the usual methods. The actual method used to determine the size of the wire is to weigh a known length. The wire has been made for use in a type of electronic tube.

RADIO

By G. L. Beers
RCA Victor Division, Radio Corporation of America

GENERAL

The year 1947 was an outstanding radio year in many respects. All previous radio receiver production records were broken both with respect to the number of instruments produced and their market value. Decisions reached by the International Telecommunications Conference at Atlantic City and the promulgation of a broadcasting code by the National Association of Broadcasters are expected to have a far reaching influence on radio in the future. Considerable progress was made toward the development of television into a firmly established broadcasting service, and the networking of an independent group of FM stations was undertaken.

THE FEDERAL COMMUNICATIONS COMMISSION

At the beginning of 1947, the Federal Communications Commission was composed of Charles R. Denny, Chairman; Paul A. Walker; Clifford J. Durr; Ewell K. Jett; Ray C. Wakefield; Rosel H. Hyde. In March, Commissioner E. M. Webster was appointed to fill the unexpired term of Paul A. Porter. Commissioner Wakefield's term of office expired July 1, 1947, and R. F. Jones was appointed in his place. Chairman Denny resigned Oct. 31, and President Truman designated Commissioner Paul A. Walker to act as Chairman until Denny's successor was chosen.

BROADCASTING APPLICATIONS

The unusually large number of applications for broadcasting facilities which burdened the Federal Communications Commission during 1946 continued through 1947. Applications for standard broadcasting stations, which operate during the day only, and for low-powered stations in communities not previously served, were granted in great number. The interference which these stations might cause to existing stations was not considered a serious problem. Applications for stations operating at night and capable of causing interference to existing stations were delayed because of the more extensive hearing procedures involved.

A station operating at night on a regional channel is usually required to employ a directional antenna, which will prevent destructive interference to other stations on this channel, and on adjacent channels. In order that the Commission may determine that destructive interference would not be caused to stations on a given frequency, an engineering study must be made. This study must include the existing stations and the new or modified facilities requested by the applicants. The services of two or more engineers for a week or ten days are required by each such engineering study. Applications were received so rapidly that each time a study was completed, the Commission found that one or more new applications had been filed, which invalidated the engineering work. Finally, a 30-day freeze order was issued by the Commission, during which both government and industry engineers cooperated to complete the engineering studies of applications then pending. As a result of this procedure, the Commission was able to reduce very materially the backlog of applications.

The hearings with respect to the use of cleared channels in the standard broadcast band continued through 1947, without a Commission decision with regard to policy. However, the engineering work involved in this hearing resulted in the adoption of several new engineering standards and in the modification of existing standards.

CONDITIONAL GRANTS FOR FM STATIONS

Applications for FM broadcasting stations were received in almost as great volume as for the standard broadcasting stations. The Commission was anxious to establish the postwar FM broadcasting system and, since it would not have time to make studies of all the FM applications received, adopted the procedure of issuing "conditional grants." A conditional grant was intended to indicate to the prospective licensee that the Commission had found it qualified to operate an FM station. Applicants receiving such grants could then proceed with their plans to construct the station with the knowledge that, when they met the appropriate engineering standards, a license would be granted. Many of the holders of conditional grants were permitted to operate with reduced power and temporary antenna systems in order to provide FM service pending the delivery of necessary equipment for a complete installation. By these expedients, the number of FM broadcasting stations operating at the end of 1947 was increased to more than 300.

COMMERCIAL OPERATION OF COLOR TELEVISION STATIONS

The hearing with respect to the commercial operation of color television stations in the frequency band from 480 to 920 mc, which began the latter part of 1946 was continued into the early part of 1947 and the Commission's decision was announced in the spring. In the decision, the Commission noted that there was serious question regarding the desirability of the standards proposed for this type of operation and that insufficient field testing had been done to prove that a satisfactory color television service could be rendered to the public.

Existing television stations improved their facilities during 1947, and a considerable number of new stations were installed. The rate at which applications for television stations were being filed was increasing rapidly at the end of 1947.

INTERNATIONAL TELECOMMUNICATIONS CONFERENCES

The International Telecommunications Conferences at Atlantic City, which began May 15, 1947, were ended Oct. 2. During this period, international agreements were concluded which have far-reaching significance to the communications industry. The new decisions are subject to ratification by the several participating governments and in general become effective Jan. 1, 1949. Three overlapping conferences were held during the sessions at Atlantic City, namely, the Radio Conference to revise the Radio Regulations of Cairo, 1937; Plenipotentiary Conference to revise the Madrid Convention of 1932, and High Frequency Broadcasting Conference to undertake a new project, the formulation of a frequency assignment plan for high frequency broadcasting stations. The last-named Conference was not finally adjourned but adopted an interim report to serve as a basis for its continuation in Mexico City in 1948. The Radio Conference completed all its work except the establishment of a new Frequency List, which will be drawn up during meetings to run over a period of more than a year at Geneva, beginning Jan. 1, 1948. The Plenipotentiary Conference completed its work and produced a new Telecommunications Convention. The Convention is completed by General Regulations, General Radio Regulations, and Internal Regulations, to which are annexed some 35 protocols, resolutions, and opinions, and the Telephone, Telegraph and Additional Radio Regulations, the last three to be revised at a conference in Paris in 1949.

REVISION OF THE FREQUENCY ALLOCATIONS TABLE

The Frequency Allocation Table was extended to cover the spectrum between 10 kc and 10,500 mc. Radical changes were made in the allocations to provide for the newer radio services such as the aeronautical service. Recognition had to be given to the requirements of many countries for the use of high frequencies for Tropical Broadcasting. With a great deal of difficulty, the United States succeeded in preserving the amateur bands with the exception of the band 1800 to 2000 kc and 50 kc of the amateur space in the 14 mc band, these losses being compensated for by a new band 21,000 to 21,450 kc for amateurs. As was expected, substantial losses were taken by the fixed services. With but very few exceptions, the frequency allocations which were proposed by the United States (and which in many instances are already in use as the basis for domestic allocations) were adopted. One of the major changes in the original plan, which the United States itself decided to propose, was the allocation of most of the 960 to 1660 mc band for an integrated aeronautical system for safety and control of aircraft in flight.

INTERNATIONAL FREQUENCY REGISTRATION BOARD

A new device for the more effective registration of frequencies and which looks to a more efficient use of the radio frequency spectrum was the creation of an International Frequency Registration Board to sit permanently at Geneva. It is composed of 11 members, who do not represent particular countries but are the custodians of an international public trust. The Board will adopt advisory opinions on frequency assignments and give technical guidance to all nations with a view to the utilization of the radio frequency spectrum on a sound engineering basis. Thus, for the first time, governments have relinquished some portion of their sovereign rights in bringing about, through international action, an orderly and economical assignment of frequencies.

PROVISIONAL FREQUENCY BOARD

Another major decision at Atlantic City was the unanimous agreement to revise the entire list of assignments for stations operating in the congested bands where harmful international interference exists. A Provisional Frequency Board was established to which all nations may send representatives, which will draw up a complete new plan for station assignments subject to approval at a Radio Administrative Conference to be held on the completion of the work within approximately one and one-half to two years. The United States has a vital interest in the work of this Board, and, without such a plan, a most serious impairment of its services, due primarily to the loss of frequency space in the fixed bands, would result.

ADMINISTRATIVE COUNCIL

An Administrative Council, composed of 18 members, each representing a particular country, will meet periodically to provide better administration for the various boards and committees of the Union and to handle a limited number of emergency matters. The first meeting of the Board, expected to be of three or four weeks duration, was held in January 1948.

MILITARY RADIO EQUIPMENT

Government support of radio research and development during 1947 continued at a very substantial rate. Shoran, the most precise method of air navigation presently available, was further improved in accuracy. Figures published by the United States Army Air Force, which employs Shoran equipment for long distance triangulation surveying, aerial photography and other purposes, indicated consistent accuracies of about 30 feet at 300 miles.

Several air tragedies during the year emphasized the need for a comprehensive system of air navigation and traffic control. The development of systems such as Navar, Lanac, and Teleran was expedited to meet this need. Teleran, a system which combines television and radar to give the pilot a pictorial presentation of navigational conditions, was developed to the point where flight tests were started.

An event which received widespread publicity was the completely automatic 2,400-mile trans-Atlantic flight of a U. S. Air Force C-54 from Stephensville, Newfoundland to Brise Norton, 40 miles west of London, England. The plane carried an emergency crew of nine, but no human hand touched the controls on the entire flight. The automatic flight was accomplished by self-controlled, pre-set mechanisms.

RADIO RECEIVERS

Based on actual production figures for the first 11 months, the total industry production of AM, FM, auto and television receivers is estimated at 17,300,000 units. Television and FM receivers accounted for 1,140,000 and 170,000 units, respectively. A limited supply of cabinets continued to restrict the production of console type receivers. The number of television receivers produced rose sharply in the fourth quarter. Receiving tube production for 1947 is estimated as 185,000,000 tubes. In addition, approximately 3,100,000 tubes of the non-receiving types were produced.

AMPLITUDE MODULATION (AM) BROADCASTING

During 1947, the Federal Communications Commission licensed many new low powered AM broadcasting stations. At the end of the year, over 1,900 stations were either licensed or authorized.

The 25th Annual Convention of the National Association of Broadcasters (NAB) was held in Atlantic City during the week of Sept. 22. A code of standards of practice for the broadcasting industry was submitted to the convention. The code contained sections regulating broadcasts, involving such subjects as religion, profanity, race, marriage, crime, and insobriety. Limitations were placed on the time which could be devoted to advertising in any given program period. Considerable opposition to certain features of the code developed toward the end of the year among independent broadcasters, and the possibility of its early acceptance remained in doubt.

FREQUENCY MODULATION (FM) BROADCASTING

At the end of the year, the Federal Communications Commission had licensed or authorized over 1,000 FM stations. Early in the year, the Commission found it necessary to modify the allocation plan for FM stations so that in any particular locality the assigned frequencies were separated by at least 800 kc.

Considerable progress was made during the year in meeting the demand for transmitting equipment. Development work on 50 kw transmitters was completed, and units providing this power output were being manufactured.

The Continental Network, which was organized as an independent FM network at the end of the year, included over 30 FM stations. Many of these stations obtained the network programs by receiving the signals broadcast by other FM stations. Some, however, were interconnected through the use of lines supplied by the Telephone Company.

The American Federation of Musicians (Petrillo) continued to prohibit the duplication by FM stations of programs carried by associated AM stations. AFM members were also prohibited from playing for the Continental FM Network although they were permitted to perform for individual stations.

A number of FM tuners, in the price range between $20 and $30, were placed on the market. These tuners were designed for use with standard AM broadcast receivers. Several of these devices employed the super-regenerative principle.

TELEVISION BROADCASTING

Deliveries of television transmitters by manufacturers during 1947 made it possible for a considerable number of new stations to institute a program service. At the end of the year, 18 stations were operating with commercial licenses, and the Federal Communications Commission had either licensed or authorized over 70 stations. Applications for television stations were being filed with the FCC at a rapidly increasing rate, and the total at the end of December exceeded 70. In a number of localities, the available television channels were already exhausted. Hearings were scheduled in some of these localities to determine the successful applicants.

Further progress was made during the year in providing facilities for television networks. The Telephone Company, at the end of the year, had installed over 5,000 route miles of coaxial cable. One of the coaxial circuits extended from Florida to the West Coast. This circuit, however, did not include terminal facilities suitable for television programs.

The Telephone Company's radio relay system between New York and Boston was completed and formally demonstrated in November. This system employs seven repeater stations to cover a distance of approximately 220 miles. Frequencies in the vicinity of 4,000 megacycles are employed. The highly directional antennas used at each repeater station are of the horn type with 10-foot square apertures. Each antenna utilizes a metal lens. The completion of this radio relay system make facilities available for transmitting television programs in either direction between Boston and Washington. The coaxial cable between New York and Washington was used extensively during the year for the transmission of television programs.

The General Electric Company completed the installation of a television relay system between New York and Schenectady. Another system was installed by Station WBKB between South Bend and Chicago and used to broadcast the Notre Dame football games. Both systems operated on frequencies in the region of 2,000 megacycles.

TELEVISION RECEIVERS

Although only two or three of the leading radio receiver manufacturers were producing television receivers during a substantial part of 1947, it is estimated that a total of over 170,000 receivers were produced. The number of manufacturers entering the television receiver field rose sharply near the end of the year.

The majority of the receivers produced in 1947 were table models employing 10″ directly viewed picture tubes. Other receivers of the directly viewed type utilized tubes ranging in diameter from 7″ to 20″. AM and FM receivers were included in some television consoles and some models also contained a phonograph.

During the year, two home television receivers of the projection type were introduced, employing reflective optics and special viewing screens. Although one receiver employed a reflection-type screen, while a translucent screen was used in the other, both provided a directivity pattern which resulted in a substantial brightness gain. Directional screens of these types have an additional advantage in that they minimize the detrimental effects of room lighting on picture contrast. These projection type receivers were capable of producing 15″ by 20″ pictures having highlight brightnesses in the range between 30 and 100 foot lamberts.

TELEVISION PROGRAMS

Sporting events constituted one of the major sources of television program material. Substantially every type of amateur or professional sports contest was televised at some time during the year. The television audiences in New York and Philadelphia were able to see almost all the major league baseball games played in their respective localities. The world series games provided one of the year's major television attractions and were broadcast by a television network including stations in Schenectady, N. Y., New York City, Philadelphia, and Washington. Football games and boxing were likewise used extensively as television program material.

A 1947 television feature was the first broadcast from the White House of the President speaking to the nation. The availability of television broadcasting facilities along the eastern seaboard was one of the major factors in the selection of Philadelphia as the site for both the 1948 Republican and Democratic National Conventions.

Considerable effort was expended by television broadcasters in the development of new program techniques. Quiz programs of the audience participation type were used to some extent. A number of excellent dramatic presentations were broadcast.

As the size of the television audience increased with the installation of large numbers of new receivers, an increasing interest in television developed on the part of advertising agencies and other commercial organizations. Audience surveys were made and demonstrated conclusively the effectiveness of television as an advertising medium. At the end of the year a large number of commercial organizations were sponsoring television programs. Several television stations had established commercial rates for their broadcasts. These rates were adjusted upward at intervals to correspond to a substantial increase in the television audience.

COLOR TELEVISION

Development work on color television systems continued in the laboratory. On April 30th a demonstration of the RCA all-electronic color television system was given at the Franklin Institute in Philadelphia. A 7.5′ by 10′ color picture was projected by three kinescopes producing separate red, green and blue images. The three images were superimposed on the screen to form a single image in natural color.

TECHNICAL PROGRESS IN SOUND EQUIPMENT

By W. J. Morlock
Specialty Division General Electric Co., Syracuse, N. Y.

GENERAL

Sound Equipment appeared on the market in sufficient quantity during the year 1947 to ease the critical consumer demand. Much of this equipment was of improved styling and new design.

The trend was toward better quality and higher price. The individual units, commonly termed "Package Items," were the first to come into the market in volume. Much of this equipment was made by manufacturers who were not in this business before the war. Owing to the extreme demand for equipment, the new manufacturers' items encountered less sales resistance than would have been normally encountered in the pre-war period.

It was significant to note that the circuits and circuit components were very similar for items in the same price and power output class. This was owing in part to the standardization of tube types by the tube manufacturers during the war. This standardization resulted in the equipment manufacturers utilizing tube complements which showed a high degree of similarity. The use of feed-back and inverter stages in amplifiers was practically universal. The amplifier performance characteristics showed a marked improvement as to frequency response, distortion, and stability when used with varying load impedances. This improvement was due primarily to the use of feed-back and improvement in transformer characteristics.

Most component manufacturers had the usual amount of difficulty in changing their production from Government type of components to the Commercial type. This resulted, in some cases, in an abnormal amount of component field failures. Production during the latter part of 1947 showed this condition to be under control and the field failures reducing to a normal figure.

USE OF PRINTED CIRCUITS

A significant trend, which may affect sound equipment amplifier designs, has been the use of printed circuits. These circuits partially eliminate the use of wire and soldered connections by substituting lines printed or painted with conducting ink or paint on an insulated base. In addition, resistors and small capacitors are formed directly on the insulated base by the use of special resistance paints and insulating coatings. This practice has become prevalent in the hearing-aid field, and there is a trend toward it being used on the larger amplifiers. Adoption of this idea in "Package Units" would reduce the size of the equipment now being sold.

SOUND REINFORCING

The "Two-Way" type of speaker, which has had wide usage in the motion picture equipment field, is becoming more prevalent in the high quality sound reinforcing systems. Specially designed units for sound reinforcing are now being manufactured by many of the sound equipment companies.

The most significant development in the field of sound recording was the widespread use of magnetic recording. Wire and tape recorders reached the market in sufficient volume to establish a consumer reaction. This reaction has been extremely favorable, and much development work is now being done to further improve the quality.

The most promising developments have been in improvements in the magnetic paper and plastic tapes being used. The quality of sound being obtained from the tapes is now approaching that obtained from the photographic sound on film systems.

SOUND AMPLIFYING SYSTEMS

The sale of "Custom-Built" sound systems is being superseded by "Packaged Sound Systems" wherever practicable. These systems usually are equipped with adequate controls to enable the systems to be adapted into any type of application without appreciable alterations. The school and hospital systems feature radio chassis capable of Frequency Modulation reception so as to be able to adequately receive the large number of new Frequency Modulated transmitters which are going on the air. Many hotels are installing sound systems of a high quality type, in preference to the individual radio set in each room. These systems show no major changes in operating principles but feature better response and lower distortion, which is a result of improvements made in amplifiers and loudspeakers. The use of emergency paging in hotel systems has become practically universal in order properly to direct the guests in case of fire or other types of emergency conditions. Some systems provide for individual room paging, but the majority of installations rely on the system of "Zoning" the floors for emergency announcements.

The demand for industrial type systems did not reach its expected proportions owing to the curtailment of new building. It is expected that this demand will be increasing as the new building programs get under way.

16 MM SOUND MOTION PICTURE PROJECTORS

The primary demand for 16 MM Sound Projection equipment has been in the educational field. Large quantities of this equipment were produced and sold during 1947, and the indications are that an item of this type will become a necessary teaching aid in all modern educational institutions.

No radical changes were apparent in the equipments being sold. Slight improvements were noted in screen illumination and picture resolution, which were owing to improvements in the optical systems. Most of this improvement was accomplished by the use of non-reflective coatings on the lens. The anticipated lightweight single case units did not appear on the market to any great extent, but the indications are that there will be new lightweight models of a simplified design appearing on the market during 1948.

Demonstrations of the use of a magnetic sound track on 16 MM film were made by the Armour Research Foundation. These demonstrations clearly indicated the feasibility of sound reproduction at standard film speeds from a magnetic track instead of by the optical method now being used. Film of this type will permit the amateur photographer to add his own narration to the film which he has exposed. While the technique for this application has been worked out, no film is commercially available. There are good indications that film with a magnetic track will become available during 1948, along with adapter kits for converting the standard sound projectors to magnetic reproduction. This method would permit the user to record or erase sound narration from the film as it is being projected.

SOUND MOTION PICTURE EQUIPMENT

No significant technical advances were noted in the 35 MM Sound Motion Picture Reproducing Equipment. Slight improvements in the efficiency of the loudspeaker systems were made. These improvements were due primarily to the use of improved magnet materials and improvements in design techniques. There is a definite trend toward reducing the size and complicity of the amplification equipment. This is accomplished by utilizing the space and materials in a more efficient manner.

One manufacturer demonstrated large picture television projection to the Motion Picture Industry. This demonstration showed the feasibility of large picture projection using reflection optics (Schmidt). The light intensity and resolution was much lower than that normally obtained in regular film projection, but it may be that this deficiency will be tolerated in order to gain the advantage of instantaneous projection of the actual event. It is not anticipated that this type of projection will have any appreciable effect on the motion picture industry for a few years.

The recent demonstrations of a high speed film developing and fixing equipment indicated that there may be a good possibility that the method of exposing film to a high resolution television tube and quickly processing it in a continuous manner for projection in conventional projectors may become an important factor in the projection of televised events to motion picture audiences.

The use of magnetic sound track on 35 MM film has been successfully demonstrated by the Armour Research Foundation. The quality was comparable to the present photographic process. The applying of this technique to Motion Picture film is governed primarily by the equipment obsolescence factor and the economies involved. This type of sound recording ~~is~~ being carefully analyzed and experimental recording channels are being set up in order properly to evaluate the over-all performance.

BROADCAST AUDIO STUDIO EQUIPMENT

The advent of television, frequency modulation, and an increase in the number of standard broadcast stations created a demand for studio equipment which continued to remain high during 1947 in spite of the failure of the building construction program to remain on schedule.

The studio equipment is becoming more complex as the scope of the broadcaster is extended into television and frequency modulation stations. The consoles being purchased are designed to include provisions for picture as well as sound monitoring. The amplifiers being used are, in general, the "Plug In" type and feature wider range and lower distortion characteristics. These features are particularly important when frequency modulation is used, as the quality and range of this type of broadcast must be kept to the highest possible standards.

The effect of the requirements for wide range has extended to each item in the channel. Wide range microphones, having improved characteristics, have been especially designed to extend the range into the 30 to 15,000 cycle region. Instantaneous recorders for transcription work are being developed to have noise and response characteristics to meet these requirements.

As a result of the demand for high quality transcription equipment, there has been a trend in the broadcasting field toward the use of magnetic tape recorders, and many manufacturers are concentrating their development and design activities toward producing magnetic recording and reproducing equipment especially designed for this application. The plastic and paper base magnetic tape is especially favored as it can easily be edited and spliced. In addition, it has exhibited low noise and response characteristics which are especially desirable. It would appear that magnetic recorders and reproducers will become a standard piece of broadcast studio equipment.

NAVAL ARCHITECTURE AND MARINE ENGINEERING

By James L. Bates
Director, Technical Division, United States Maritime Commission

GENERAL

In the fields of Naval Architecture and Marine Engineering, the year 1947 was one of adjustment to the impacts of various post-war forces as well as of assimilating some of the lessons which the performances of many war-built ships have made available.

While it can not be said that there has been a "return to normalcy" since 1945, there has unquestionably been, here in America, a widespread movement away from the war physicologic of cooperative endeavor. This has developed in a number of disputes between labor and management. These, in turn, have reacted in shortages in materials and equipment. Management has shut down entirely or partially many war-built plants, and much wartime labor has returned to pre-war occupations outside shipbuilding where the possibilities seemed more attractive.

Ship operators have taken advantage of the opportunity to purchase war-built freighter tonnage reconverted under the provisions of the 1946 Ship Sales Act. In this way, there has been provided temporary occupation for both shipyards and labor. However, even in this field, strikes and materials shortage have delayed work and increased costs.

Political policies, both foreign and domestic, have reacted unfavorably upon shipbuilding. These have developed programs of foreign and domestic economy simultaneously. Therefore, budgetary and Congressional allotments for American merchant shipping have been drastically curtailed.

RESEARCH PROJECTS

During the war, there were initiated many research projects of broad scope. There was also much experimental and progressive full scale work put into service. For example, the Navy controllable pitch propeller, the Kort nozzle application to large seagoing tugs, and the all welded construction of large merchant ships. These and many other appliances and methods were utilized under emergency conditions in the effort to speed up production and to secure greater efficiency in an all-out effort.

With the cessation of actual hostilities there remained many research projects requiring completion in order not to render valueless the work already done. Also, there were masses of accumulated performance data relatively valueless without proper arrangement and study.

In addition to such organizations as the Navy Department, the Maritime Commission, the American Bureau of Shipping, and the United States Coast Guard, there are many committees organized to prosecute certain research projects. These various agencies, some separately and others in combination, have labored to prosecute projects under way, to analyze available data, and to outline further procedure when deemed desirable. The year 1947 has seen the completion of some old projects and the initiation of several new ones.

The following are listed as among the factors which have been particularly influential in Naval Architecture and Marine Engineering in the year 1947: continued experiment relating to and study of the large welded ship; continued study of and experiment with the loading and unloading of cargo; the use of aluminum in ship hull structure; development of the marine gas turbine and its installation aboard ship; the controllable pitch propeller for use in large vessels; reconversion of war-built vessels to peacetime purposes; new construction completed; preparations for the International Convention for the Safety of Life at Sea; the report of the President's Advisory Committee on the Merchant Marine; and some trends which were apparent during the year.

EXPERIMENT AND STUDY RELATING TO THE LARGE WELDED SHIP

During the war, there was formed a Committee on Ship Structure, composed of representatives of the U. S. Navy Department, the U. S. Maritime Commission, the American Bureau of Shipping, and the U. S. Coast Guard. This Committee published a report, dated July 15, 1946, which presented the data with conclusions based on a large number of experiments (about 45) intended to throw light upon the multi-axial stresses developed in ship's structures, upon the suitability of the steels used in the hulls of wartime ships, upon the effect of welding sequences, upon structural discontinuities, upon various types of hatch corners, upon scale effect and other pertinent factors.

Further investigations upon temperature effects, various qualities of steel, multi axial effects, and the like are now being processed under the supervision of a sub-committee composed of representatives of the same four agencies.

The American Bureau of Shipping has continued its study of the Liberty ship fractures and now leans toward the conclusion that the poorly designed hatch corners in the original Liberty vessel were more responsible for initiating major failures than at first supposed.

During the year, the T2 type tankers (vessels having a length somewhat in excess of 500 feet) showed sufficient serious fractures to necessitate serious study.

Certain private operators introduced crack stoppers in the form of slots covered by seam straps extending throughout the middle half length of the ship. After a conference at which representatives of the American Bureau of Shipping, the Coast Guard, the Maritime Commission, and various operating companies were present, the Maritime Commission authorized a program of crack stopper fittings to its fleet of T2 tankers as the ships could be made available. It should be noted that the crack stopper referred to does not strengthen the hull. It merely provides a line of relative structural discontinuity which it is believed should stop the extension of a crack if one should start.

STUDY AND EXPERIMENT IN THE LOADING AND UNLOADING OF CARGO

Studies of voyage reports indicated that stevedoring expenses amounted to between one-third and one-half of the operating charges of a C-type cargo vessel. It was obvious that here was an item worthy of the most serious consideration. Special types of ship had been designed and operated successfully. These ships generally fell into two classes—bulk carriers and container carriers. The first class are strictly limited in respect to the type of cargo which can be handled and the second as to the type of container which may be used. Neither type thus far has been satisfactorily adapted to package cargo, particularly where several ports of call are involved. The Maritime Commission undertook to make special studies of the problem in cooperation with several outside interests.

One of the studies related to the use of side ports, side ports being essential where the holds to be served are underneath several tiers of superstructure. There has resulted a transversely operating carriage which carries a horizontal boom capable of extension either to port or starboard through the side port. This apparatus has successfully passed its initial tests and should give valuable service.

When ordinary size deck hatches are served with overhead gear there usually results a time-expending operation consisting of the movement of the cargo from the hatch square to the corners of the hold. It is felt that the design of the ship, with as large hatch area as possible (approaching Great Lakes practice), will eliminate this element entirely or at least decrease it. Designs have been prepared embodying this feature.

The Maritime Commission assisted the inventor in developing a special type of overhead transverse trolley with the necessary tracks. This apparatus was installed and operated in service with partial success. With the experience thus gained there has been constructed an improved unit which has been set up on land and is now partially through its tests.

This matter of cargo handling represents a continuing project which is worthy of continued study leading to further improvements of method and increased economy of operation.

USE OF ALUMINUM IN SHIP HULL STRUCTURE

In the past, this material has been successfully used in small deck houses, for ship's boats, ship's masts, and the like. There has just been completed at the Alameda plant of the Bethlehem Shipbuilding Company a ship which carries a long aluminum superstructure. This ship was originally intended for use as a troop transport. When it was decided to complete her for the carriage of passengers, aluminum was adopted for the upper tier of superstructure in order to minimize the amount of permanent ballast required.

Naval architects, in the past, have had to rely solely on the service performance of certain vessels for guidance as to what liberties can be taken in new designs. While this reliance upon the past has served and continues to serve a useful purpose, progress towards increasing the structural efficiency of the passenger ship by this means only will be necessarily slow. The reason for this is that a ship structure presents too many variable and complex factors, none of which has been made the subject of a scientific appraisal. In other words, no systematic collection of data is available on the structural behavior of a multi-deck hull under controlled and measurable loading conditions. One has only to point to the two diametrically opposite philosophies with respect to the need of expansion joints in a long deck house passenger ship to appreciate the wide gap that exists between respected authorities.

As far back as 1939 the necessity for an orderly program of studies and experimentation in the field of ship structure was recognized. It was reasoned that the collection of engineering data would enable the designer to understand more fully the performance of the structure, and would arm him with the necessary knowledge to permit him to depart from the "beaten path." For this purpose, extensive laboratory studies were conducted by the Aluminum Company of America. The data obtained from these studies clarified many points which, at that time, could only be conjectured. The laboratory test specimen, however, though designed to simulate the structure of a passenger ship, could not be made absolutely to scale and satisfy all the requirements of the theory of similitude. The model departed slightly from the prototype; hence it yielded data which had qualitative value only. The laboratory study, therefore, could not answer the specific question: How effective is the superstructure of the P-2 class of ships? The question could only be answered through a full scale structural test on the ship itself.

The fact has been established that aluminum, judiciously placed, can improve the stress condition at several highly stressed regions of the hull. It, however, introduces two additional features worth consideration: corrosion and thermal stresses. The matter of corrosion seems to have been adequately considered by providing actual separation between steel and aluminum by means of a spacer impregnated with zinc chromate. The matter of thermal stress, however, can not be solved so easily. The difference in the thermal coefficient of expansion of the two materials brings about a condition of restraint which develops a thermal stress in the aluminum of unknown intensity. These stresses have been the source of some concern, and it was considered desirable to determine their intensity on the actual ship.

Such was the background that led to the planning of the structural test on the *President Wilson.* This project had two broad objectives: to confirm the basic design assumptions that governed the structural design of the vessel, and to determine if there are apparent any points of weakness which might result in some structural failure in service.

This test was designed to appraise the interaction between the aluminum superstructure, the steel deck house, and the main hull girder. Strains and deflections were recorded for five separate loading conditions which induced varying bending moments on the hull structure. A temperature study was also made to establish basic data on the behavior of the aluminum structure. Important contributions to the field of structural design of large passenger vessels are indicated by the test.

DEVELOPMENT OF THE MARINE GAS TURBINE AND ITS INSTALLATION

The first marine gas turbine contracted for by the Maritime Commission is now nearing completion. The low pressure compressor was given the final running test at the plant of the vendor during September 1947. The high pressure compressor was put on test late in November. The low pressure turbine was tested in January 1948. The complete plant should be assembled and tested in April 1948.

The installation of a gas turbine in a merchant vessel is being made to further the American Merchant Marine by adequately testing at sea under regular operation a new and very promising prime mover. That this is quite necessary to maintain a competitive position is indicated by the fact that the British are installing a gas turbine for the same purpose. There are also indications that the Swedish are proceeding along the same line. Obviously, it is essential to continue the start in this field if the American Merchant Marine is to compete.

This installation is to be made in a Liberty Collier for reasons outlined later, but it is of interest and will be closely followed by the whole shipping industry. No American operator could afford to pay the development costs for such an installation; consequently, when this project was considered in 1944, the Maritime Commission decided to make the installation.

The gas turbine is not an untried or experimental device, and it is confidently expected to operate efficiently and satisfactorily. However, as in the case of any new development, there may be minor components and accessories which are faulty or misapplied which will require correction.

The Commission's primary function in this installation, then, is to make such modifications to the stationary gas turbines as past experience indicates is necessary for marine use, place the vessel in commercial service, continuously check the operation and make further modification, if necessary, until the unit is suitable for marine service. To accomplish this a short run between two easily reached ports of call, preferably on the East Coast, is required. Further, to help recapture part of the development cost, the installation should be such that it will enhance the value of the vessel selected, and the vessel should be a type that will be retained in continuous service.

CONTROLLABLE PITCH PROPELLER FOR USE IN LARGE VESSELS

During the war, the Navy used with great success a controllable pitch propeller on light displacement vessels. In view of this experience, the Maritime Commission undertook to ascertain its value when used with vessels of heavier displacement and slower turning machinery. One consideration which made the experiment of further importance was its possible use in connection with the marine gas turbine.

The Commission pioneered on the *M. V. Single Hitch.* This was the first installation of a controllable pitch propeller on an American merchant vessel, and during the first few months of operation several minor faults were discovered and corrected. Today the vessel is in regular service operated by Lykes Bros., who are so enthusiastic and pleased with its operation that they recently inquired of the necessity of submitting further reports since the propeller always operated perfectly. This is cited as an example of a development which benefits the entire marine industry by offering to American operators more efficient and economic vessels with which to meet foreign competition.

RECONVERSION OF WAR-BUILT VESSELS TO PEACETIME PURPOSES

The general purpose of the Merchant Ship Sales Act of 1946 was the sale of merchant vessels (government-owned or controlled) to private interests. In connection with these transactions there were a number of minor steps which developed into problems of greater or less importance. The principal methods followed and the outstanding results obtained are covered in the following discussion.

The principal classes of vessels affected by the 1946 Act were: (a) *"Ready" Vessels.* This class included cargo vessels which had not, as a rule, undergone extensive reconversions for military service and therefore required only such repairs as were necessary to secure class, plus the removal of certain National defense features; (b) *Military Types.* This heading included, generally, ships of the long-range C2 and C3 classes which had been taken over by the military during the war and subjected to more or less extensive conversions for wartime service, relatively elaborate reconversions being necessary in order to make them suitable for general operation as cargo carriers; and (c) *Special Types.* This class included such ships as transports, combination cargo and passenger vessels.

The accomplishments secured under this act are presented under two headings, namely, Military Types and Special Types:

MILITARY CONVERSIONS

	No. of Contracts Placed in 1947	No. of Ships Delivered	Undelivered	Canceled	Estimated Latest Delivery
Straight Cargo	84	63	18	3	Jan. 1948
Good Neighbor Ships	2		2		Feb. 1948
Moore-McCormack Ships with Betterments	3		3		May 1948
American Export Ships with Betterments	4		4		June 1948
Total	93	63	27	3	

Of the above 63 ships which have been delivered 45 settlements have been made. At present it is contemplated that there will be 34 additional military vessels to be surveyed.

NEW CONSTRUCTION

The *President Cleveland* and *President Wilson* are sisterships originally contracted for as P2 turbo-electric twin screw troopships, but are under construction according to a rearrangement for combination passenger-cargo service to Japan, China, and the Philippines. These vessels feature the most extensive use of aluminum for superstructures yet employed on any commercial vessel, thereby decreasing the need for ballast and commensurately increasing cargo deadweight capacity.

The *SS Del Norte* and her two sisterships have been completed for New Orleans to East Coast of South America service. Comfortable accommodations for 98 passengers modify the basic Maritime Commission C3 cargo vessel design to provide much needed space on this essential foreign trade route for the traveling public.

Also completed are three 18½ knot twin screw refrigerated cargo vessels with accommodations for 12 passengers each, now in service in the fruit trade between the West Indies, Central America, and the United States; nine C2 combination vessels with accommodations for 52 passengers each, now plying between New York and the west coast of South America; three Victory cargo type modified to carry 98 passengers apiece between New York and the Virgin Islands, Barbados, and Trinidad; the last four of a contract for six C3 cargo vessels for New York to the east coast of Africa route; and nine smaller single screw refrigerated cargo vessels for the fruit trade.

INTERNATIONAL CONVENTION FOR THE SAFETY OF LIFE AT SEA

In preparation for an International Conference for the purpose of revising the Safety of Life at Sea Convention of 1929, the Department of State authorized the creation of a number of technical committees to deal with specific points in that Convention and further authorized the creation of the General Committee, composed of representatives of all interested government agencies and of the maritime industry, as a sort of supervisory body whose final recommendations to the Secretary of State could be considered as fairly representing the national viewpoint in maritime safety matters.

This Committee met Feb. 7, 1945, in Washington, D. C., and heard Assistant Secretary Clayton comment on the need for revision of the 1929 Convention and the Commandant of the Coast Guard outline his plans for approaching the task. At that meeting, the General Committee approved the general plans and policies proposed, subject to such modifications as might be found necessary or desirable in the course of the work.

The technical committees, composed of experts in their special fields, have completed their reports, and the results have been consolidated in draft form for the consideration and comment of the General Committee. This draft, as it may finally be approved by the General Committee, will be transmitted to the Secretary of State with the recommendation that it be adopted as the United States proposal for the revision of the 1929 Convention at the Conference which is being called by the United Kingdom for that purpose on April 16, 1948.

REPORT OF THE PRESIDENT'S ADVISORY COMMITTEE ON THE MERCHANT MARINE

Since the end of the Second World War the American Merchant Marine has been the center of much controversy. The vast amount of excess tonnage in slow cargo vessels, the practical lack of passenger-carrying ships, the virtual loss of our pre-war coastwise shipping, the conflicting claims of other maritime nations, and the worldwide economic maladjustment were some of the serious elements. On the other hand, it was generally recognized that, for purposes of national defense, an adequate American Merchant Marine in active operation and manned by American officers and crew was essential.

The U. S. Maritime Commission had prepared a long-range building and replacement program which, over a period of years, would have secured some of the desired results. However, faced with rising prices and the demand for assistance to Europe, the allotment for new construction for the fiscal year 1948 was meager.

In order to secure intelligent and unbiased consideration of these most serious problems the President appointed a Committee of five outstanding leaders in industry who should present a report with recommendations. This report was submitted to the President and published in pamphlet form in November 1947. Among its salient features may be noted the following:

The basic philosophy and general provisions of the Merchant Marine Act of 1936 are sound and should be retained as the foundation for the national Merchant Marine policy. Shipbuilding skills and the know-how of ship operation are essential national assets and must be preserved. For the successful administration of the act, the Maritime Commission should be reorganized in the interest of prompt accomplishment. A shipbuilding program in general agreement with that advocated by the Maritime Commission is proposed. In the interest of national defense shipbuilding should be distributed within certain limitations. A progressive replacement program is advocated. A fixed construction subsidy is proposed. The restoration of a construction revolving fund or a separate shipbuilding authorization with suitable contract authority is proposed. Steps in the interest of domestic shipping are advocated.

It is to be noted that this report, while of genuine value as representing the formal conclusions of leaders in their several fields will not necessarily result in pertinent legislation. It is sure to have a certain amount of enduring influence, but it obviously requires the appropriation of large amounts of money by the Congress to make it effective.

CURRENT TRENDS

Trends which have been apparent during the year were: a marked interest in intelligent design looking toward continuity of hull structure and the elimination or control of vibration; a tendency, not yet too pronounced, to design around the conceptions of cargo handling and stowage; open-mindedness toward new materials in ship construction and equipment; continued emphasis on speed shown not so much in a blind acceptance of extreme figures as in a willingness to investigate possibilities and effects before a decision is reached; and a moderate but rather general reaction against unnecessary or increased controls over shipbuilding and ship operation.

DIVISION XX

GEOPHYSICAL SCIENCES

EARTHQUAKES AND VOLCANOES

By Frank Neumann
United States Coast and Geodetic Survey

GENERAL

Seismic and volcanic activity followed a normal pattern in 1947 with no outstanding event in either field. Several great earthquakes were recorded on seismographs but, being of submarine origin, they attracted little public attention. In the United States there was a strong trend toward expanding and coordinating seismological, vulcanological, and other geophysical activities especially among governmental and university groups.

EARTHQUAKES IN FOREIGN AREAS

In Europe a destructive shock occurred on Feb. 5 near Prinzren in southern Yugoslavia, and three persons were killed on April 15 near Patras, Greece. Twelve villages in southern Italy suffered severe damage on May 11, and 12 when four persons were killed and 1,500 homes destroyed. All of Portugal was shaken on Oct. 3. Moderate shocks occurred in Switzerland, the French Alps, the Lombardy Alps in Italy, and in southern Germany.

Constantine in Algiers was damaged on Aug. 6. Perhaps the most destructive earthquake of the year occurred in the Khorassan Province of Iran on Sept. 23 when five villages were reported destroyed and 400 persons died. In South America 233 persons were killed on Nov. 1 in central Peru in the La Merced, San Ramon, and San Luis de Shuaro areas. Pasto, Colombia, devastated in 1827, suffered $580,000 damage on July 15. San Carlos, Colombia was damaged on April 11, and in Bolivia several villages near the Peruvian border were badly shaken on Feb. 24. Other shocks of note in South America occurred in Brazil, Chile, Ecuador, and southern Argentina.

In Central America two persons were killed at Puerto la Union in El Salvador on Jan. 24, and damage was also reported from Nicaragua. Volcanic eruptions accompanied the earthquakes. More than 100 shocks were felt in El Salvador and many in Nicaragua. One person was killed and many injured near Santiago, Cuba on Aug. 6.

In Japan, Hida, in Kyushu Prefecture, suffered cracked roads and walls on May 9. Gisborne, New Zealand was inundated on March 26 by a 30-foot seismic sea wave originating 50 miles offshore. A smaller wave struck Makorori and Tolago Bay on North Island on May 18. On Oct. 14 damage was reported south of Greymouth on South Island, and on Aug. 25 the Napier region of North Island was visited by the worst shake since 1931. Two moderate shocks occurred in the Philippine Islands.

EARTHQUAKES IN THE UNITED STATES AND POSSESSIONS

The strongest shock of the year in the Pacific coast area occurred in the Mojave Desert on April 10 when some small buildings were leveled in villages near the epicenter, and rocks rolled down the mountains. Tall buildings in the San Francisco Bay area were shaken on June 22 by a shock causing some damage near Watsonville. Western Montana was shaken over a wide area by an earthquake near Butte on Nov. 23. Elsewhere the most notable shock of the year centered in Branch County in southern Michigan on Aug. 9. Slight damage was reported from several towns. On May 6 a wide area near Milwaukee, Wis. was shaken and on June 29 St. Louis, Mo. reported slight damage from an earthquake centering 15 miles southeast of the city.

Central Alaska, on Oct. 15, experienced the worst earthquake since 1937. In the epicentral region 20 miles southeast of Nenana there were wide cracks in the frozen muck and rock slides and earth slumps along the railroad. Merchandise stocks were badly damaged.

SEISMOLOGICAL STATIONS AND INSTRUMENTS

Fifty-six seismograph stations were maintained in the United States, and eight outside of the country were operated by American organizations. Modern seismographs were installed at the College of the City of New York and at Hungry Horse Dam in Montana. New equipment was installed at John Carroll University, Cleveland, O.; and at Gonzaga University, Spokane, Wash.

New stations were planned in western Oregon, Utah, Connecticut, Indiana, Texas (2), and Washington. The University of Washington planned installation of modern instruments at Seattle and at two auxiliary stations in the Puget Sound area.

Experimental work on new types of seismographs was conducted by the Naval Ordnance Laboratory, Carnegie Institution of Washington, Colorado School of Mines, University of Texas, Franklin Institute, and the United States Coast and Geodetic Survey. In France a vertical-motion seismograph was developed on the principle of the American Wenner horizontal seismograph. Most of the American developments were concerned with remote visible recording, on observatory and field instruments, through the use of electronic apparatus.

A seismograph station was established in the Antarctic by the Finne Ronne Expedition. In the Aleutians the United States Geological Survey set up several stations in connection with vulcanological studies. In Canada a new station was established to study rock burst phenomena, and in Colombia a new station was planned at Chinchina. The Navy expanded its network of hurricane microseism stations in the West Indies and is inaugurating a similar network in the western Pacific. The instrumental program in Santo Domingo sponsored by Fordham University to study local shocks was continued. The Huancayo, Peru magnetic and seismological observatory of the Carnegie Institution of Washington was transferred to the Peruvian Government. New Zealand planned the establishment of a vulcanological laboratory at Rotoria, North Island.

SEISMOLOGICAL INVESTIGATIONS

Further progress was made at the California Institute of Technology in assigning instrumental earthquake magnitudes to all important earthquakes recorded on seismographs, and a comprehensive study of the geological significance of southern California earthquakes was completed. A treatise on the analysis of seismograms by distinguishing between wave types was published by a Finnish investigator. New theories were advanced to explain the mechanics of microseisms resulting from low-pressure areas over the oceans, and efforts are being made to determine water pressure at great depths to obtain corroborative evidence. The United States Coast and Geodetic Survey sponsored a worldwide program of reporting microseismic activity and surf observations during the year 1947.

Ground vibrations set up by the detonation of 4,600 tons of high explosives on Helgoland were recorded by all sensitive seismographs in Europe and at temporary stations established by British and American seismologists. Portable visible recording seismographs especially developed by the United States Navy registered the tremors as far as northern Italy. A submarine seismological survey of a portion of the Mid-Atlantic Ridge was undertaken by the Woods Hole Oceanographic Institution. New information on the structure underlying the Snake River lava plains of southeastern Idaho was obtained from seismographic observations made when large quantities of unserviceable ammunition were exploded near Arco.

ENGINEERING AND VIBRATION RESEARCH

Fifty-two strong-motion seismographs were operated in the United States and seven in Central and South America to obtain information on destructive ground motions for engineering studies. Nine moderate shocks were registered. Ten specially designed seismographs were installed on the Golden Gate bridge to study vibrations due to wind, earthquakes, and other causes. The City and County of San Francisco adopted a revised building code which contains new provisions for earthquake forces. A new seismic probability map to accompany the Uniform Building Code of the Pacific Coast Building Officials Conference was prepared. Geodetic surveys in the Imperial Valley revealed the nature of the widespread permanent ground displacements following the destructive earthquake of 1940.

SEISMOLOGICAL ORGANIZATIONS AND PUBLICATIONS

On the Pacific coast an Advisory Committee on Engineering Seismology was organized to further investigate the application of seismological data to the design of earthquake-resistant structures. The State Department again sponsored the visit of an American seismologist to many seismological stations in the American Republics to encourage the coordination and advancement of seismological work in the western hemisphere.

The first meeting since the beginning of the war of the International Seismological Association of the International Geodetic and Geophysical Union was held in Paris in July. A grant was obtained from UNESCO to continue the publication of the *International Seismological Summary* which is a compilation of seismographic data and epicenter determinations for the entire world.

VOLCANOES

In the Aleutian Islands, Akutan Volcano erupted on Jan. 5, and on Jan. 10 Mount Shishaldin on Unimak Island exploded dropping ashes two feet deep at False Pass 20 miles away.

In Central America Conchagua Volcano in El Salvador erupted for the first time since 1828, strong earthquakes occurring simultaneously in the Fonseco Bay area. In Nicaragua Cerro Negro Volcano became active about July 12. By July 22 ashes covered an area 28 miles in diameter killing cattle and damaging crops. Geleras Volcano in Colombia erupted on July 14, the same day a destructive earthquake occurred at Pasto.

In the Philippine Islands Mayon Volcano exploded on Jan. 13 after five years' dormancy, forcing evacuation of many towns. An observer in a plane saw the peak first grow very red, swell up like a bubble, and then burst. In Iceland, Mount Heckla threw clouds of ashes and fumes six miles high on March 30, blacking out a wide area and forcing ships along the south coast to use running lights in the daytime. Mount Etna in Italy experienced the most violent eruption since 1928 on Feb. 26. Vineyards and forests were damaged to the extent of $700,000. In west Java, Mount Gedeh threw up a smoke pillar two miles high on Jan. 27. A second violent eruption followed on Oct. 18. On Aug. 14 Mount Asama, 90 miles northeast of Tokyo, erupted violently, killing several mountain climbers. Paricutin Volcano in Mexico continued intermittently active. The form of the cone changed markedly through slumping of large segments, and new areas were covered by lava flows. Scientific observational programs were continued.

MINERALOGY AND PETROGRAPHY

By CLIFFORD FRONDEL
ASSOCIATE PROFESSOR, HARVARD UNIVERSITY

SYNTHETIC INDUSTRIAL CRYSTALS

A broad program of research and development work on the synthesis of single-crystals for optical, piezoelectric, and other industrial or scientific purposes has been carried on during recent years in various government, university and industrial laboratories. The program has in large part been financed by government agencies and is directed both at making the United States independent of certain foreign raw materials of foreign origin and at developing new crystals of superior properties. The most important outcome of this work in 1947 was the discovery that the mineral tourmaline could be synthesized by laboratory methods. This substance, a complex borosilicate useful for electronic and optical applications, is widespread in nature but rarely is of sufficiently high quality to be utilized. Most of the natural supply has come from Brazil and Madagascar. It has now been synthesized, although so far only as microscopic crystals by re-crystallization of fused tourmaline glass in water held at high temperatures in steel pressure vessels.

Announcement also was made of the synthesis of the substance titanium dioxide (rutile) as single-crystals of large size. The material was made by the Verneuil process, used also in the synthesis of aluminum oxide (corundum). The synthetic rutile has a number of unusual properties which probably will find important industrial and scientific applications. The extremely high indices of refraction will lead to applications in refractometers and other optical devices, and to some use as a gem stone. Its outstanding characteristic, however, is in an extremely low electrical resistance comparable to that of a semi-metal. This originates in an oxygen-defect structure of the crystal, and the resistance can be adjusted upwards by many megohms by controlling the oxygen deficiency.

Further progress also was reported in the synthesis of single-crystals of quartz, and at least one of the several methods of synthesis now known is nearing the pilot plant stage. The substance has been grown as relatively large crystals from solutions of silica in alkali carbonate or silicate solutions held at high temperatures in steel containing vessels. At the present time the United States is entirely dependent on Brazil for supplies of this important raw material. Both nepheline and mica (fluor-phlogopite), the latter useful because of its dielectric properties, are being synthesized, the latter on a large scale, by methods involving crystallization from molten solutions.

SYNTHETIC STAR SAPPHIRES AND RUBIES

The crystallized form of aluminum oxide, known as corundum because of its toughness, resistance to impact, and great hardness, long has been used as a bearing material in watches, compasses, meters, and other instruments. The colored varieties of corundum known as sapphire and ruby also are highly prized as gem stones; these owe their blue and red color, respectively, to traces of impurities present in solid solution in the crystal structure. Almost all of the corundum used for both industrial and gem purposes is presently made synthetically. In the Verneuil process, powdered aluminum oxide is melted in an oxyhydrogen or oxyacetylene flame and is allowed to fall dropwise and crystallize upon the surface of a pear-shaped seed crystal known as a boule. Natural gem sapphire and ruby, especially when of fine color and large size, always has sold at a considerable premium over the synthetic stones. This has been particularly true of the asteriated types, which hitherto have resisted all attempts at synthesis and are known only from nature. The asteriated stones show a visible, six-rayed luminous star superposed on the colored background. Star sapphires and especially star rubies of large size and superior quality sell at prices upwards of several thousand dollars a carat and in recent years have enjoyed a considerable vogue. During the fall of 1947, the Linde Air Products Co., a subsidiary of Union Carbide and Carbon Corp., and presently the sole manufacturer of synthetic corundum in the United States, made the startling announcement that both star sapphires and star rubies had finally been synthesized. Small numbers of the stones were then made available through commercial channels. The synthetic star stones rival the finest of the natural gems both in color and in perfection of the star. The price, while lower than that of the natural material, still is high relative to the ordinary varieties and is likely to remain so in view of the apparent difficulties of manufacture. The synthetic stars are fundamentally identical with the natural gems but have certain characters discernible to an expert which allows them to be distinguished from the latter.

NEW POLYMORPHS OF ZINC SULFIDE

X-ray study of zinc sulfide crystals, recently found at localities near Pittsburgh, Pa., have led to the recognition of an important series of polymorphs analogous to those known in silicon carbide. The crystals occur in clay ironstone concretions in the Brush Creek limestone formation of Pennsylvanian age. Four types of polymorphs have been found. These are crystallographically related to wurtzite and form a series of hexagonal and rhombohedral structures based on alternative schemes of hexagonal closest-packing. This discovery will no doubt lead to the recognition of similar instances of polymorphism among other hexagonal or pseudo-hexagonal minerals characterized by close-packing of the anions.

MISCELLANEOUS MINERALOGICAL STUDIES

The mineral brazilianite, first described in 1945 from a locality in Brazil, recently has been found in a granite pegmatite at North Groton, New Hampshire, that is being mined for mica and beryl. It occurs with whitlockite, first described from this locality in 1941, and a number of other rare phosphates. At least 15 new minerals were described during 1947, but not all of them appear to be entitled to species rank. A new arsenate of bismuth from a tin deposit at Potosi, Bolivia, has been named rooseveltite. Two new uranium minerals from the deposits at Shinkolobwe in the Belgian Congo, both uranium hydroxides, have been named paraschoepite and epiianthinite. Pennantite is a new manganese-rich type of chlorite from the Benallt mine in Wales. A new telluride of iron allied to marcasite from a gold vein in Quebec, has been named frohbergite. The second known natural occurrence of sodium bicarbonate in the United States has been found in oil shale of the Green River formation in Garfield county, Colorado. A new species, nigerite, has been added to the small list of minerals containing appreciable amounts of tin. It occurs as hexagonal plates associated with cassiterite in pegmatites in central Nigeria. Nuevite is a new rare-earth columbate from California. Fairchildite and butschliite are carbonates of potassium and calcium found in slags formed by the fusion of wood ash in partially burnt trees.

PUBLICATIONS

Strategic Minerals: A Summary of Uses, World Output, Stockpiles, Procurement, by J. B. DeMille (McGraw-Hill, New York, 626 pp., 1947). Information is given concerning the properties, uses, domestic and foreign sources of supply, production and price of 76 minerals and metals of industrial importance. The descriptions are arranged alphabetically, from "aluminum" to "Zirconium" and include much information concerning Governmental controls and official regulations issued during the Second World War.

An Introduction to Crystallography, by F. C. Phillips (Longmans, Green, London, 302 pp., 1947) is a clearly expressed survey of the subject at an elementary to intermediate level. The work is divided into two main parts, concerned with the external symmetry and the internal atomic symmetry of crystals.

Identification and Qualitative Chemical Analysis of Minerals, by O. C. Smith (Van Nostrand, New York, 351 pp., 1946). A determinative handbook consisting essentially of tables based on the physical and chemical characters of minerals. Twenty pages of colored illustrations, mainly depicting blowpipe reactions and mineral colors, are included.

Revised Lapidary Handbook, by T. H. Howard (Greenville, S. C., 220 pp., 1946) is a detailed treatise on the art of cutting, carving, and polishing gem stones written primarily for the amateur.

TERRESTRIAL MAGNETISM AND ELECTRICITY

By H. D. Harradon

Department of Terrestrial Magnetism,
Carnegie Institution of Washington

GENERAL

The year 1947 was marked by a new tendency in the conduct of geomagnetic, geoelectric, and ionospheric operations. This tendency is particularly manifest in respect to work of a continuous character which must be carried forward over a long period of years. Private organizations and universities have redirected their efforts mainly to short-term experimental and theoretical researches and are now participating chiefly on a cooperative basis, in these larger-scale investigations in the public interest, which have been considerably expanded under government auspices.

GEOMAGNETIC RESEARCH

The major development in geomagnetism was the evolution of an attractive new theory of the earth's main field and its secular change by W. M. Elsasser. According to this theory, extensive fluid motions within the earth's central core are the cause of the magnetic field. The mechanism is somewhat analogous to that of a sort of self-exciting dynamo. Given a field like that of a uniformly magnetized sphere, even though initially very weak, there will be accompanying it an electric pattern as well. These patterns or modes will interact to intensify each other, the power coming from the rotational energy lost through friction caused by lunar tides. The main product of the interaction is a magnetic field within the core which is likely to be stronger than that at the earth's surface, and of a type which has no magnetic field just outside the core. After the field builds up, it will exert a braking influence on the fluid motion itself so that there is little danger of creating a field of very great strength. The results of the theory appear to fit the facts, but, as little is known of the earth's central core, it is difficult to determine the validity of the assumptions used. Hence the most important point established is that it may be possible, starting from small beginnings, to build up a large field of permanent form. Cowling had previously proved that such a field could not be built up on the basis of a fluid-motion concept, but this proof did not take into account the presence of the electric modes of a conducting sphere.

NEW PRIMARY STANDARD

For many years, international magnetic standards have been maintained by comparisons with an instrument at the Cheltenham Magnetic Observatory of the United States Coast and Geodetic Survey. The last primary standards, however, were constructed some 30 years ago, and, in anticipation of the need of maintaining international standards and of obtaining international agreement on the value of the gamma, work on a new primary standard of great accuracy, begun by the U. S. Coast and Geodetic Survey, was continued and brought to a successful conclusion by the Department of Terrestrial Magnetism. This new standard, now completed, permits for the first time the determination of any component of the earth's magnetic vector, although it was primarily designed to measure the horizontal intensity, vertical intensity, and inclination. The constant is determined by the mutual inductance between a primary coil and a rotating secondary coil. The absolute value of the coil-constant is known to three points in a million. It is expected that this primary standard will be used by the U. S. Coast and Geodetic Survey, and, when its operation is satisfactory, it will serve as a basis for the adoption of a standard value of the gamma.

MEASUREMENTS OF GLACIAL CLAYS

Measurements of glacial clays have been continued in order to determine the changes in the earth's magnetic field over a period of many thousands of years. The direction of the field may be deduced from the polarization of clays by means of an extremely sensitive apparatus. It was found that this field, in direction at least, was substantially similar in past ages to that existing at the present time, the variation amounting to ±30°. The measurements have now been extended over an additional 5,000 years, and an indication has been noted of a 300-year period in variations of the compass.

The most important and significant results have been obtained in the determination of the polarization of the same clays redeposited in the laboratory with various field strengths. In this way was obtained a curve relating to the intensity of the field in which the clays were originally deposited and the newly deposited clay. For measurements of the clay *in situ*, the average value of intensity about 3,000 years ago was found to be within ten per cent of that of the present geomagnetic field.

To facilitate this work, a truck was equipped with apparatus suitable for examination of clay and rock samples in the field, thus eliminating the possibility of disturbing their magnetization during transportation to the laboratory and speeding up the work by a factor of 10 or 20. Operations were carried on during the fall of 1947 in the Connecticut River Valley and the Five Finger Lake region of the St. Lawrence River Valley. One of the results was the verification of the geologic stability of clay.

A spherical harmonic analysis of the earth's main field for 1945.0 indicated that the fraction of the dipole component of the main field of external origin was less than one per cent of the observed surface field and, accordingly, less than indicated by previous analyses. Examination of the analyses of the secular change at four epochs, ten years apart, indicated a rather steady decrease of about 20 gammas per annum in the dipole component although the most recent value, that for epoch 1942.5, is considerably less. This may indicate that the dipole component of the main field may be diminishing at present less rapidly than during the last century.

This new analysis gave the coordinates for 1945.0 of the north geomagnetic pole (the point where the axis of uniform magnetization penetrates the earth's surface in north polar regions) as 78.6° north and 289.9° east, and for the south geomagnetic pole as 78.6° south and 109.9° east. These results differ from those obtained by Bauer for 1922 by only 0.1° in latitude and 1.1° longitude.

New opportunities for direct measurements in the region 100 km or more above the earth have been opened by the experimental firing of the V-2 and other rockets by the armed forces of the United States. One of the experiments concerns the direct observation of the magnetic fields within the large electrical currents which circulate in the upper atmosphere and cause magnetic variations at the earth's surface. Attention has been given to preliminary designs for apparatus to record the magnetic changes expected when a rocket passes through and above a current-sheet in the ionized regions. This would be of great interest in locating the level of the currents which cause the magnetic diurnal variation, magnetic storms, and other variations. Further development of this project by the Applied Physics Laboratory of the Johns Hopkins University, in cooperation with the Naval Ordnance Laboratory and the Department of Terrestrial Magnetism, is anticipated during the coming year.

The precision of measurements of total magnetic intensity with airborne magnetometers has been considerably improved by various geophysical prospecting companies and the Naval Ordnance Laboratory. The entire state of Texas and other extensive areas of the United States have already been surveyed by this method. Its importance may be readily understood from the fact that there is thus afforded a speedy reconnaissance survey of potential petroleum and other mineral sources for an entire state in only a few months. This reconnaissance survey indicates potentially valuable areas warranting later application of gravity and seismic methods of geophysical prospecting which assist the geologist in the location of suitable sites for drilling operations.

AIRBORNE MAGNETOMETER

This airborne magnetometer has also been usefully applied in obtaining information relating to the distribution of land areas underlying the thick ice of the Antarctic continent, the location of submerged and unchartered mountains and extinct volcanoes in the Pacific area, and studies are in progress for determination of indications relating to deep-seated structural composition of the Appalachian Mountains and the continental shelf of the United States and nearby islands. This work is being undertaken by such organizations as the U. S. Geological Survey, Naval Ordnance Laboratory, and Columbia University.

Progress has also been made toward the measurement of other field components by air, and experimental surveys have been conducted, particularly in magnetic declination. When suitable techniques are further developed, it will be possible to conduct surveys by air for obtaining the values customarily required for the construction of isomagnetic charts for navigation and other purposes.

GEOELECTRICITY

A thunderstorm project (U. S. A. F. —Carnegie) was designed to contribute to the elucidation of the fundamental problems of terrestrial electricity—the origin and maintenance of the earth's negative charge. It is possible that measurements of air conductivity and potential gradient during airplane flights above thunder clouds may prove or disprove the theory that the flow of electrical current from the ionosphere into thunderstorms distributed over the earth's surface is sufficient to maintain the earth's charge. In cooperation with the U. S. Army Air Weather Service and in close liaison with the Thunderstorm Advisory Committee, instruments developed at the Department of Terrestrial Magnetism of the Carnegie Institution were installed in airplanes, and flights were made in the autumn of 1947. During August and September, installations were made in an airplane (B-29) at Wright Field. On Oct. 3, the airplane was moved to Tinker Field near Oklahoma City, whence flights over four thunderstorms were made, ranging in altitude from 40,000 to 44,000 feet. Measurements of the current passing through thunderstorms were made on all flights by photographing the dials of the recording instruments every few seconds. Considerable time will be required to complete the reduction of the records.

The observational portion of the Weather Bureau-Army-Navy-NACA Thunderstorm Project was terminated Sept. 23, 1947. The analysis work is well under way, and it is expected that the Project will terminate June 30, 1948.

A very successful season was experienced in 1947 when many more thunderstorms were observed than had been expected. A total of 88 storms passed over the surface network between May 1 and Sept. 23, 1947. There were 38 airplane flights through these thunderstorms at different heights with a total of approximately 775 traverses. These planes were equipped to measure the electric field of the atmosphere. An AT-6 airplane made approximately 66 traverses through small cumulus clouds, the plane being specially equipped for this purpose and selected for use during the 1947 season in place of the gliders used in Florida in 1946.

It was necessary for proper analysis of thunderstorm data to make certain other studies which included soundings in stable air, soundings into cumulus clouds, and others of a series nature begun in the morning, continued through the day during the period of instability, and concluded in the evening when the air had again become stable. In cooperation with Stanford University, eight electrostatic field-sondes were released and ground (electrostatic field) measurements were taken during 30 storms.

In the summer of 1947, a very complete program of special observations of atmospheric electricity was carried out at the Huancayo Magnetic Observatory by W. D. Parkinson. These observations included conductivity of the air, ionic content of the air with respect to the various types of ions, determination of the mobility of ions and rate of ionization.

A number of projects, under government contract, was carried out during the year, for the investigation of lightning discharges by means of apparatus mounted in airplanes. Extensive work on lightning, dealing particularly with magnitude, sign, and character of the current in the stroke, was continued by the General Electric Company.

UPPER AIR RESEARCH WITH V-2 ROCKETS

Important contributions to solar spectroscopy, cosmic rays, and measurement of atmospheric pressures and temperatures have already resulted from upper-air research utilizing German V-2 rockets. This extensive program is being conducted by various organizations including the Air Materiel Command, involving the University of Michigan and Watson Laboratories, the Applied Physics Laboratory of the Johns Hopkins University, the Signal Corps, and Naval Research Laboratory, together with a number of other contributing organizations. All the activities are coordinated through a V-2 Panel on which the various participants are represented. The present program embraces cosmic rays, ionosphere, pressure, temperature, and composition measurements, and astrophysics involving the spectrum of the sun.

The results already achieved have supplied information on the nature of cosmic radiation. It was determined that the greater portion of primary radiation is made up of "hard" particles and that about one out of five of these particles will produce a shower in 12 cm of lead. It was also found that large showers were produced by the primaries in a rather considerable mass of material in the warhead surrounding the counter telescope and that (at zenith angle of 45°) about 60 per cent of the radiation was absorbable in a large thickness of lead (14 cm) and about 35 per cent of the high altitude rays were stopped in either the first or second plate, indicating that the component was not primary.

One flight carried a single Geiger counter in the extension of the nose of the rocket. By means of guard counters the effect of the rocket could be subtracted from the total counting rate of a single counter. From this, a measurement of the total flux of particles above the atmosphere has been made. The value of the flux is two to three times that obtained from Millikan's data and indicates that there is either a considerable quantity of low-energy particles above the atmosphere or that a large part of the energy of the primaries is dissipated in non-ionizing events.

By means of ionization chambers carried in the rocket an extension of the rate of burst formation with altitude has been obtained. It is thus indicated that these bursts increase in frequency right up to the top of the atmosphere. This measurement shows that the primaries do make large bursts on the first encounter with the atmosphere.

It has been possible, by means of rockets, to make measurements inside the ionized regions of the upper atmosphere namely at altitudes corresponding to the top of the E-region. Rocket-borne apparatus supply direct means of solving the present ambiguity regarding the ratio of free electrons to ions in this region, thus offering more accurate knowledge of many factors affecting long-distance radio propagation. Data have been obtained from the retardation of the waves as the rocket passes through the ionized layers, but they have not yet been reduced or interpreted.

One of the outstanding measurements has been the determination of pressure and temperature up to altitudes of 100 km. Especially noteworthy is the correspondence of the shapes of these curves to the analogous NACA (National Advisory Committee for Aeronautics) curves which were inferred from the physical and geophysical effects in the atmosphere. In general, it may be said that the experimental rocket curves fall entirely within the limits specified in the NACA predictions.

IONOSPHERIC RESEARCH

The Central Radio Propagation Laboratory of the National Bureau of Standards has continued the services of collection and distribution of ionospheric data. Long-term and short-term forecasts of radio-communication conditions, as well as results of special analysis and research projects, are distributed to a large mailing list.

Effects of the earth's magnetic field on the distribution of ion density in the ionosphere have been recognized and are being applied in forecasts of radio propagation conditions. The sunspot-numbers were higher in 1947 than at any other time since regular observations were begun a century ago, and this new maximum of solar activity was reflected in the behavior of the ionosphere leading to very high critical frequencies and making it possible on numerous occasions to carry on long-distance communication on 50 megacycles.

It has been concluded from studies of layer formation and equilibrium, that observed electron densities may be accounted for without having recourse to high solar energy.

Extensive investigations of upper atmospheric conditions have been undertaken by numerous investigators employing radio methods for the observations of ionized trails produced by meteors.

The panoramic motion-picture technique was applied to recordings of the solar eclipse in Brazil on May 20, 1947. The anticipated ultraviolet eclipse-effects in the E-, F1- and F2-regions were followed by the formation of an unusual stratification in the F2-region. No evidence of a corpuscular eclipse was reported.

Where ionospheric trends with solar activity, are well established, better measures of solar activity can be obtained from ionospheric data than from observed sunspots.

The Derwood Experimental Laboratory of the Carnegie Institution of Washington has been completed. This Laboratory replaces the Kensington field station and provides a base for experiments in the upper atmosphere, and related physical and solar phenomena, including experiments involving radio echo sounding, cosmic rays, solar noise and related effects.

OBSERVATORIES AND SURVEYS

The five magnetic observatories of the U. S. Coast and Geodetic Survey (Cheltenham, Md.; Tucson, Ariz.; Honolulu, Hawaii; Sitka, Alaska; and San Juan, Puerto Rico) continued in operation through the year. At the Honolulu Magnetic Observatory, the instruments were transferred in March 1917 to the new buildings on Barbers Point. The site near Eva, which has been used for 45 years, was directly in line with the heavily used airplane runway, necessitating abandonment of the magnetic work there. The new magnetic observatory near College, Alaska, is nearing completion, and it is expected that it will be placed in routine operation early in 1948.

The geomagnetic, ionospheric, seismic, and meteorological programs were maintained at the Huancayo Magnetic Observatory in Peru, operated by the Carnegie Institution of Washington. In accordance with the policy of the Department of Terrestrial Magnetism (under whose auspices the Observatory was established and has been operated) to devote increasing attention to short-term experimental and theoretical researches, arrangements for the transfer of the Huancayo Magnetic Observatory to the Government of Peru were completed, and the documents legalizing the transfer as of July 1, 1947, were signed at Washington, Sept. 19, 1947. The Observatory will henceforth be known as the Geophysical Institute of Huancayo (Instituto Geofísico de Huancayo). In accordance with the agreement the Carnegie Institution of Washington will supply about one half of the costs of maintenance until June 30, 1949, after which date all expenses will be borne by the Government of Peru. During the years that have elapsed since its establishment in 1922, the Observatory has contributed much to the advancement of geophysical science, and there is every reason for believing that the high standards maintained in the past will be continued under the new management. In like manner, the Watheroo Magnetic Observatory in Western Australia, operated by the Carnegie Institution of Washington since its establishment in 1919, was transferred on July 1, 1947 to the Government of Australia.

The regular geophysical programs were continued throughout the year at the observatories of Pilar, La Quiaca, South Orkneys, and San Miguel in Argentina, at the Vassouras Observatory in Brazil, and at the Magnetic Section of the National Astronomical Observatory of Mexico at Teoloyucan.

The Canadian observatories of Meanook and Agincourt, under the Dominion Observatory, continued in operation through 1947, as did also the Godhavn Observatory in Greenland, operated by the Danish Meteorological Institute of Copenhagen.

In cooperation with, and under the sponsorship of the Interdepartmental Committee on Scientific and Cultural Cooperation, J. H. Baden, Geophysicist, U. S. Coast and Geodetic Survey, made magnetic observations at various repeat stations in several South American Republics from February to June 1947. The results of these observations will be used in the revision of the isogonic charts of Central and South America.

POLAR REGIONS

Lieut. Charles A. Schoene and Dr. H. Herbert Howe were representatives of the U. S. Coast and Geodetic Survey on the recent Navy Antarctic Expedition, known as Operation Highjump. On the southward journey magnetic dip observations were made at one point on the pack-ice. At Little

America, a magnetograph for vertical intensity was operated from Jan. 29 to Feb. 22, 1947, and absolute observations were made for total intensity, dip, horizontal intensity, and declination. On the return trip instruments were standardized at Amberley Magnetic Observatory, near Christchurch, New Zealand, and a secular variation station was occupied at Old Panama.

The following preliminary values give the mean annual change for Little America for the interval 1940-1947: Declination: 5′ per annum counterclockwise sense; south dip: 4′ per annum, decreasing; horizontal intensity: 70 gammas per annum, increasing; vertical intensity: 100 gammas to 170 gammas, decreasing numerically.

INTERNATIONAL UNION OF GEODESY AND GEOPHYSICS

After a lapse of nine years, the Eighth General Assembly of the International Union of Geodesy and Geophysics, of which the Association of Terrestrial Magnetism and Electricity is a part, is tentatively scheduled to be held in Oslo, Norway, Aug. 17-28, 1948.

U. S. COAST AND GEODETIC REPORTS

The U. S. Coast and Geodetic Survey is issuing a series of reports which present the records of its observatories in a new form. These reports contain approximately quarter-size reproductions of the magnetograms for six-month periods, together with preliminary annual mean values derived from abridged scalings. The purpose of presenting the magnetograms in this form is to mitigate the condition of increasing lag which has heretofore existed. During the calendar year 1947, the following publications have been issued (or are in press): *Magnetograms,* Cheltenham, Md., January-June 1946 (No. MG-C46.1); *Magnetograms,* Sitka, Alaska, January-June 1946 (No. Mg-S46.1); *Magnetograms,* Tucson, Ariz., January-June 1946 (No. MG-T46.1); *Magnetograms,* Honolulu, T. H., January-June 1946 (No. MG-H46.1); *Magnetic Declination in the United States,* 1945 (Serial 664).

OTHER PUBLICATIONS

At the Department of Terrestrial Magnetism six volumes of results have been completed, two of which contain the magnetic results from the Watheroo Magnetic Observatory for the years 1919 through 1944, being volumes VII-A and VII-B of the *Researches of the Department of Terrestrial Magnetism.* Two further volumes of the "Researches" have been published: C.I.W. Pub. 175, vol. 7, *Land and Ocean Magnetic Observations 1927-1944,* and C.I.W. Pub. 175, vol. 12, containing I—"Ionospheric Research at College, Alaska," July 1941-June 1946 and II—"Auroral Research at College, Alaska," 1941-1944. In press is a volume presenting the Tucson Observatory earth-current results for the period 1932 to 1942. Manuscripts for eight additional volumes have been prepared covering work on geomagnetism, ionosphere, earth-currents, and atmospheric electricity at various observatories, including Watheroo and Huancayo. A book entitled *Description of the Earth's Main Magnetic Field and Its Secular Change 1905-1945* has also been issued.

In order to assure that geophysical data from observatories become accessible for study without final publication, recommendations were made to the Huancayo and Watheroo observatories for relatively prompt publication of the vital summaries of their observations, using microfilm techniques, for distribution to a selected list of interested establishments.

The U. S. Coast and Geodetic Survey, which has long been recognized as an important repository of geomagnetic data from worldwide sources, has now been designated by legislative action as the official United States repository. Organizational arrangements and preliminary activities have been instituted for the fulfillment of this function.

The quarterly journal *Terrestrial*

Magnetism and Atmospheric Electricity, published by the Johns Hopkins Press, completed its 52nd annual volume in 1947. This journal contains original contributions to geomagnetism and geoelectricity and related subjects, sections on magnetic storms, magnetic character figures, notes and annotated bibliography.

The 28th annual meeting of the American Geophysical Union was held in Washington, D. C., April 28-30, 1947. The papers presented at these meetings, as well as original contributions from other sources, are published in the bimonthly issues of the *Transactions,* together with progress-reports, review, abstracts, bibliographies, information and notes of interest to geophysicists.

Geophysics, the quarterly official publication of the Society of Exploration Geophysicists, completed its 12th volume in 1947. This journal contains original contributions to general and applied geophysics, often including articles dealing with the electrical and magnetic methods of geophysical prospecting. It also contains reviews of pertinent publications and information of interest to members of the Society.

Terrestrial Magnetism and Electricity ("Physics of the Earth," vol. VIII), originally published in 1939 by McGraw-Hill Book Co., has been out of print for some time. In order to meet the demand for this volume, it is now being reprinted by Dover Publications, New York.

METEOROLOGY AND CLIMATOLOGY

By F. W. Reichelderfer
Chief, United States Weather Bureau

GENERAL

The year 1947 in the field of meteorology and climatology was much like the previous year in many respects. There was a continuation of activities associated with the resumption and expansion of peacetime weather services. The demand for weather and climatological information from the general public and private interests continued to increase as more and more people became acquainted with the special uses to which such information could be put in their various activities. The Weather Bureau placed special emphasis on re-directing its programs to meet the growth in demands for these services. Some expansion in the services of the Weather Bureau occurred to meet the needs of increased international air traffic which included the establishment of aviation forecast centers at Honolulu, T. H., and San Juan, P. R., and additional staffing of existing international aviation forecast centers within the country. Agreements were made through the International Civil Aviation Organizations for the establishment of an adequate number of weather ships, strategically located in the North Atlantic, to provide weather information for international airways. One half of the ships are to be provided by the United States.

The service through which weather reports are received from merchant ships was reactivated following the removal of restrictions on communications and the return of the merchant fleet to private operators. By the middle of the year the program was approaching full operation with over 300 weather reports per day being received from the Atlantic, Gulf, and Pacific waters. Arrangements were also made with foreign meteorological services of maritime nations for their ships to supply weather reports in exchange for ours.

To meet the need for more observations from high-latitude regions, the Weather Bureau in cooperation with Danish and Canadian authorities established three Arctic weather stations, at Thule, Greenland, at Eureka Sound, and at Resolute Bay on Cornwallis Island, the latter two in Canada. In addition, an automatic weather station was installed at Dundras Harbor, Canada. The surface and upper air reports from these stations will provide the basis for further research into the peculiarities of arctic weather and at the same time meet some of the needs of meteorologists engaged in preparing forecasts for extended periods of time, which require data from the entire Northern Hemisphere.

INTERNATIONAL CONFERENCE

Directors of Meteorological services, delegates, and advisers representing 56 countries, and observers from the United Nations and the International Civil Aviation Organization attended the Conference of Directors of the International Meteorological Organization in Washington in September and October. At Toronto, Canada, technical and regional commissions of the organization had previously prepared more than 400 technical resolutions, covering nearly all phases of meteorology and climatology, for consideration by the Conference of Directors. Among the more important decisions made at Washington was the adoption of a universal synoptic code for weather messages from land and ship stations. A constitution for a new World Meteorological Organization was agreed upon by the conference, and when it is formally ratified by the governments of 30 countries, the new organization will replace the International Meteorological Organization, which has existed as an informal body without treaty status since 1878. The new organization will negotiate for affiliation with the United Nations but will remain an autonomous group.

RESEARCH PROGRAM

The post-war research program, which was well under way at the end of 1946, continued with marked changes made in the case of only a few projects. The majority of the research projects is under government sponsorship and is established on a relatively long-term basis, usually lasting at least two or three years.

THUNDERSTORMS

The second phase of the observational program of the research project for the study of thunderstorm structure, under the joint sponsorship of the United States Air Force, Navy, National Advisory Committee for Aeronautics, and the Weather Bureau, was conducted at Clinton County Army Air Field near Wilmington, O. The first phase of the observational program was completed in 1946 at Orlando, Fla. when thunderstorms of a simple cellular type were observed. Observations at Wilmington were instituted to gather data on the more complicated mid-latitude continental thunderstorms. The basic observational program in the second phase of the project was similar to that of the first phase but was amplified by supplementary studies. These included an attempt to determine quantitative precipitation by the use of radar intensity echoes, an atmospheric electricity investigation, and soil moisture and run-off studies. The comprehensive data collected will offer research workers a basis for many years of study on this important problem, and at the same time will provide immediate information on the characteristics of thunderstorms, a topic of vital importance to the aviation industry.

ARTIFICIAL PRECIPITATION

A topic which received more attention in 1947 than any other, especially in the press, is the artificial production of precipitation by seeding of clouds containing supercooled water droplets by dispersal from aircraft of solid particles of carbon dioxide, commonly referred to as dry ice. Vincent J. Schaefer (*Science,* Nov. 15, 1946) accumulated evidence in the laboratory and in the field which showed conclusively that clouds containing supercooled water droplets can be transformed into ice crystal clouds, and that the resulting ice crystals can grow to such size that they fall from the cloud as precipitation. The publication of the results of Schaefer's work led to wide-spread experiments in the field, the majority of which were uncontrolled as far as accurate determination of results was concerned; many were made in a haphazard manner by laymen.

The amount of precipitation to be expected as the direct result of the application of this technique has not been determined. The special conditions required for successful seeding of clouds are those which often lead to natural precipitation a short time later. Hence, in many of the experiments it was not known whether the rain occurred naturally or was artificially produced, or if it would have occurred a short time later if the seeding had not taken place. In addition to its application in the production of precipitation under special conditions, the technique has also been applied successfully in dissolving small portions of thin-layer clouds composed of supercooled water droplets, an operation of vital interest to persons associated with aircraft operations.

Two large-scale research projects on this general subject are in progress, one at the General Electric Research Laboratories, sponsored jointly by the Office of Naval Research and the Army Signal Corps; the other, at the Clinton County Army Air Field, Wilmington, Ohio, conducted by the U. S. Weather Bureau with the assistance of the U. S. Air Force, the National Advisory Committee for Aeronautics, and the U. S. Navy. The General Electric project involves a general study of cloud micro-structure and the phenomena of hydrometeor formation, with special emphasis on techniques for controlling and producing rain and snow. It will include cloud particle investigation to determine the liquid water content, particle size and size distribution, and the rate of growth of clouds with respect to their bases; and modification of supercooled clouds by means of seeding technique which may produce a snow or rain fall.

The project at the Clinton County Army Air Field, directed by the U. S. Weather Bureau, will use many of the facilities already available there as a result of the thunderstorm investigations described above. These facilities include 55 ground stations equipped to measure wind, temperature, humidity, and the amount and rate of precipitation; radiosonde equipment for detailed measurement of the characteristics of the upper air; and meteorological radar equipment for evaluating and automatically plotting the precipitation rates at various altitudes. It is planned to measure the physical properties and characteristics of various types of clouds capable of producing rain or snow. A carefully controlled study will be made of the factors which control the stability of natural clouds and the physical changes taking place when a cloud precipitates. These field operations will be supplemented by laboratory investigations as the need arises.

FACTORS IN AIRCRAFT ICE ACCRETION

The National Advisory Committee for Aeronautics, with the assistance of the U. S. Weather Bureau, made measurements of certain meteorological factors related to the rate of aircraft ice accretion from specially equipped aircraft. (NACA Technical Notes 1391, 1392, 1393, and 1424.) The work included the measurement of free-air temperature, liquid water content, drop size and size distribution in icing conditions, and study of the general meteorological conditions associated with these cases, with special emphasis on the cloud type.

ATMOSPHERIC CIRCULATION

Investigations of atmospheric circulation, including the studies of divergence, vertical motion, and the mechanism of pressure changes, continued to be major projects at several of the universities. In several cases, the projects were expanded in scope to consider the associated transformations of energy in the atmosphere as well. Because of the tremendous amount of work involved in projects of this type, progress is relatively slow, and results will be forthcoming only after several years of work. No further results of these projects were published during the year.

FORECASTING FACTORS

Similarly, the research on methods of extended-range forecasting continued in the U. S. Weather Bureau and at the Massachusetts Institute of Technology, and problems of the general circulation, a more complete knowledge of which is basic to further progress in extended forecasting, were further attacked at the University of Chicago. The California Institute of Technology began a study of the mechanism of blocking which is of importance in extended forecast work. Published contributions in this general field during the year included: a study of the limiting zonal wind distribution which would result from intense, thermally driven, lateral mixing processes by Rossby (*B. A. M. S.,* Vol. 28, pp. 53-68); an investigation of the formation of semi-permanent centers of action in relation to the horizontal solenoidal field by Jaw (*J. Meteor.,* Vol. 3, pp. 103-114); a paper by Namias (*J. Meteor.,* Vol. 4, pp. 125-133) on the physical nature of fluctuations of the zonal circulation; a second paper by Namias (*Monthly Weather Review,* Vol. 75, pp. 145-152) regarding characteristics of the general circulation over the Northern Hemisphere during the abnormal winter 1946-47; and a treatment of the dynamics of long waves in a baroclinic westerly current by Charney (*J. Meteor.,* Vol. 4, pp. 135-162).

In the field of short range forecasting, the U. S. Weather Bureau developed further the map-typing system of forecasting rain for the coastal region of California and applied it to the specific problem of forecasting precipitation for the period 24 to 48 hours in advance at San Francisco. The result was an objective method of forecasting from which improved forecasts are now being prepared for the San Francisco area. The development of this forecasting method has been described by Vernon (*Monthly Weather Review,* Vol. 75, No. 10). Other studies on short-range forecasting techniques of a similar nature are being carried on by the Weather Bureau in its Washington research unit and at its field stations.

ELECTRONIC COMPUTER

The studies on the use of the electronic computer for the rapid solution of complex meteorological problems, under way since early in 1946 at the Institute for Advanced Study, Princeton, N. J. progressed satisfactorily. The immediate aims of the group are the selection and mathematical formulation of meteorological problems to be solved by the electronic computer, and the construction of a pilot model of a computer suitable for these purposes. The Institute has had the cooperation of a number of other organizations in conducting this project.

CONVECTIVE PATTERNS IN ATMOSPHERE AND OCEAN

A number of papers on the general topic of convective patterns in the atmosphere and ocean were presented and published (*Annals of the N. Y. Acad. Sc.,* Vol. XLVIII, pp. 705-844) through a conference of the Section of Oceanography and Meteorology of the New York Academy of Sciences in May. This was the second meeting of this group which emphasized a single problem of meteorology and oceanography. The previous conference took place in 1942 and concerned boundary-layer problems.

CLIMATOLOGY

Long range planning of military operations during the war led to demands by the Armed forces for studies of the effect of weather on each future operation. The solution of each new problem required close coordination between the climatologist and the military planner in order that the climatological information could be of direct use without further interpretation. This type of analysis was often referred to as applied climatology, since each project was slanted toward a certain practical application. With the view that the basic method of weather planning for military operations could be applied to the planning operations of industry and agriculture, a summary of the more important wartime developments in applied climatology was prepared by Jacobs (*Meteor. Monographs,* Vol. 1, No. 1) who was associated with the AAF Weather Service during the war.

During 1946 the Weather Bureau had initiated a program for the treatment of meteorological data by machine methods in four states in the southern United States. The Weather Bureau expanded this program to include the whole country, which will make possible the processing of data to meet the needs of industry and agriculture in their planning operations, and the preparation of improved comprehensive climatological summaries for which there is much demand. At the same time the data will be readily available to meteorologists for research purposes, which removes a long existent barrier that has slowed progress in this field.

INDUSTRIAL METEOROLOGY

Private practice in meteorology, which for the most part began at the end of the Second World War, made little or no progress during 1947. Although there were several private weather services in operation, their activities, most of which are along forecasting lines, did not increase during the year, and several of the organizations were forced to retire from the field for financial reasons. Because of this lack of progress the American Meteorological Society established a Committee on Industrial Meteorology and Climatology to study the problems of the industrial meteorologist and make recommendations regarding action which will stimulate progress in this field.

PUBLICATIONS

No new meteorological textbooks or reference books appeared during the year. The American Meteorological Society initiated a new publication series, known as the *Meteorological Monographs*. Volume 1, Number 1, of this series appeared during the year. The purpose of the Monographs is to provide a medium for the publication of meteorological papers not suitable for the *Journal of Meteorology* or the *Bulletin* of the American Meteorological Society, usually by reason of length.

AMERICAN EXPLORATION

By Robert M. Brown
Professor, Rhode Island College of Education

BYRD ANTARCTIC EXPEDITION

On April 14, 1947 the U.S.S. *Mount Olympus* reached the United States and terminated the 1946-47 Antarctic Expedition under the leadership of Rear Admiral Richard E. Byrd.

The results of the Expedition include: (1) great gains in the training of Naval personnel, and testing of ships, planes, and other equipment under Antarctic conditions; (2) available reports show 60 successful photographic exploratory flights by the three groups of the expedition; (3) invaluable experience gained in the techniques of building and maintenance of a Polar camp; (4) discovery of unknown and incorrectly charted bays, inlets, glaciers, islands, and mountains; (5) information collected from aerial magnetic survey; (6) amplification of knowledge with respect to hydrographic, geographic, geological, meteorological and electromagnetic propagation conditions; (7) successful use of airborne magnetometer for plotting approximate elevation of land.

One plane, which had taken off from the seaplane tender *Pine Island* on Dec. 20, 1946 on an exploratory flight, was reported missing and was not located until Jan. 11, 1947. Three of the nine Naval personnel aboard the plane had died before the rescue crews arrived.

The expedition discovered two areas which were termed oases, areas of 40 square miles free of ice and dotted with unfrozen lakes and brown earth made up of rugged hills 100 to 150 feet high.

FOLLOW-UP ANTARCTIC EXPEDITION

The United States Navy sent two icebreakers to the Antarctic in the Fall of 1947. The personnel was a task force of the Pacific Fleet and will inspect the Little America area, collect hydrographic data and continue the development of cold weather operating technique. This expedition will be in keeping with the Naval policy to provide continuous training of personnel in the Arctic and Antarctic regions.

ARCTIC

Commander Donald B. Macmillan left Boothbay Harbor, Maine, in June for an 8,000 miles cruise to Greenland. The main object of this expedition was to time the seaward slide of four large glaciers.

Dr. William E. Powers, North Western University geographer, directed operations to measure the speed of the glaciers. The expedition was sponsored by the Chicago Geologic Society. This is Macmillan's twenty-fifth visit to the Arctic.

ALASKA

Bradford Washburn of the New England Museum of Natural History, Boston, with a party of 13, spent 90 days on Mt. McKinley during the spring of 1947. The expedition, called "Operation White Tower," was jointly undertaken by the Boston Museum, RKO Radio Pictures, the Army Air Forces, and the University of Chicago. The basic objectives of the trip, all of which were achieved, were; cosmic ray research for the University of Chicago, surveying for the United States Coast and Geodetic Survey, geological collecting for the United States Geological Survey, weather recording for the United States Weather Bureau, and a complete photograph record for the Boston Museum and RKO.

Three members of the party spent over a month above an altitude of 18,000 feet without oxygen to carry out the cosmic ray observations. Ascent was made of both McKinley peaks, and Mrs. Washburn was the first woman to reach the summit.

MEXICO

The American Museum of Natural History had during 1947 four expeditions in Mexico. Dr. Charles M. Bogert and Mrs. Martha R. Bogert were in the State of Chihuahua to search for a fringe-footed sand lizard and to conduct field experiments on amphibians and reptiles. Boris Malkin journeyed to the States of Guerrero and Oaxaca in southern Mexico to try to discover links between Central Mexican insects and Guatemalan specimens. Dr. and Mrs. Charles Vaurie were assigned to collect specimens and determine the insect faunal relationships between Costa Rica, Guatemala, and southern Mexico. Dr. Mont A. Cazier, Dr. Charles D. Michener, Dr. Willis J. Gertsch, Dr. Herman T. Spieth, and Rudolph J. Schramel conducted a field study of the biology, ecology, and zoo-geography of insects and spiders of Chihuahua and Durango, and collected insects and spiders and deadly specimens of the Durango Scorpion.

CENTRAL AMERICA

The fifth botanical expedition of the Chicago Natural History Museum to Central America got under way Nov. 15, 1946 with the departure of Paul C. Standley, Curator of the

Herbarium, for New Orleans to embark on the steamship *Junior*.

Mr. Standley remained in the field through the greater part of 1947. He made comprehensive collections of the flora of Honduras, El Salvador, and Nicaragua, mostly on the Pacific slope of the countries named. His researches will be the subject of Museum publications in the future. Four previous expeditions by Mr. Standley and Dr. Julian A. Steyermark, Assistant Curator of the Herbarium, explored the 22 departments of Guatemala in pre-war years.

Recent reports indicate that the expedition that Mr. Standley is leading is making substantial progress. Most of the time since he left in November 1946 has been spent in El Salvador and Honduras. Many different locations were visited in those countries and many species hitherto unknown from these areas were found, *e.g.*, a number of species previously known only from Guatemala have thus been added to the flora of Honduras. During the early part of May, the expedition moved to Nicaragua, the least known of the Central American countries. Here, many important discoveries are expected during the course of exploration in the next few months.

Charles Cordier, staff collector of the New York Zoological Society, and Mrs. Cordier were in Costa Rica for nearly five months and brought back 111 specimens, which was considered the most important collection of birds and mammals that the Society had ever received from Central America. Among the rare specimens are a female Yapock, an almost legendary Central American water opossum, the three-wattled Bellbird, a sickle-billed Humming Bird, male bare-necked Umbrella Birds, and Costa Rican Quetzals called the most beautiful birds of the New World.

FISH AND GAME SURVEY IN GUATEMALA

The Smithsonian Institution, the Fish and Wildlife Service of the Department of the Interior, and the State Department are engaged in a survey of the fish and game resources of the Republic of Guatemala, at the request of the Guatemalan government, which to date has brought 28,600 fish specimens to the U. S. National Museum collections.

A major object of the survey is to determine the possibility of introducing game fish of some kind in high mountain lakes. The waters seem highly suitable, but efforts in this direction in the past have proved disastrous to the present limited fish fauna which, although useless to sportsmen, are a food resource of the local population.

The ichthyological survey is being directed by Dr. Robert R. Miller of the Smithsonian staff. Among the curious species obtained are a fresh-water shark and a fresh-water sawfish, both of which may prove to be hitherto unknown varieties. The vast majority of fish of both these groups are found only in salt water. These both came from Lake Yzabal, in the tropical lowlands about 25 miles from the sea.

In the collection also are specimens of a curious fresh-water catfish, the male of which incubates the eggs in its mouth and probably occasionally also cradles the young there. There is considerable evidence, Dr. Miller says, that the baby fish return from time to time to the father's mouth for shelter for some time after they are hatched. During this long period, the male does not eat.

There are also two varieties of a curious eel-like fish—the gymnotus—which has a very curious geographic distribution. Though common in South America, there is a remarkable gap in its distribution from Colombia to Guatemala. These fish are notable for their rudimentary eyes, and probably are nearly blind, for they come out of hiding only at night.

WEST INDIES

Dr. B. E. Dahlgren, Curator Emeritus of Botany in the Chicago Natural History Museum, returned from a five-month excursion to Cuba, undertaken for the purpose of obtaining first-hand observations and material for the study of the many species of palms that are found there.

In his field work on the island, Dr. Dahlgren enjoyed the advantage of the company and collaboration of the distinguished Cuban botanist, Brother León, of Colegio de La Salle, whose unique knowledge of the island has been acquired in the course of a lifelong study of the flora of Cuba, especially of its palms, many of which were unknown to science until discovered and described by him.

The collections and many photographs now made in Cuba will enrich the Museum's palm herbarium and furnish especially desired material for cytological research.

C. V. Morton, Smithsonian Institution associate curator of plants, spent three months at St. Vincent, British West Indies, on a botanical survey. He plans to use the 4,800 specimens that he obtained as a base for a checklist of the flowering plants and ferns of the island.

PHILIPPINES

The Chicago Natural History Museum's zoological expedition in the Philippines under the leadership of Capt. Harry Hoogstraal has collected many specimens of mammals, birds, reptiles, and insects.

Most of the material was gathered in Mount McKinley, Mindanao Island. The group had a base camp in Davao Province at an elevation of 7,200 feet in the cloud zone of Mount McKinley. A survey of the area about Mount Apo was also undertaken.

Captain Hoogstraal reports "we have experienced some very rainy weather, heavy wind storms, and one locust plague at the lower camp which actually broke off the trees, but the locusts were succulent enough to reduce materially the Museum's food expenses for awhile."

BIKINI

A total of 39,000 fish, representing about 250 species, some of which are new to science, were obtained for the Smithsonian Institution collections from the waters around Bikini, site of the atomic bomb test, by Dr. Leonard P. Schultz, Curator of Fishes of the United States National Museum.

Dr. Schultz was one of the biologists of the Bikini expedition, one of his jobs being to determine the lethal effects of the bomb on fish life in nearby waters. A preliminary survey was necessary, during which the collection, which now has been brought back to Washington and is being classified, was made. The Bikini waters, Dr. Schultz found, were rich in a notable variety of fish life. Some of the species collected were quite curious. Among the more interesting animals in the collection are:—Surgeonfishes, Parrot fishes, Goat fishes, Porcupine fishes, Trigger fishes, Squirrel fish, Scorpion fish, and Flying half-beak. In addition there were many real flying fish and a great variety of brilliantly colored butterfly fish, angel fish, and damsel fish.

Dr. J. P. E. Morrison, associate curator of mollusks, who accompanied Dr. Schultz on the Bikini expedition, gave his attention to both the vertebrate and invertebrate animal life of the area except the fish. He obtained specimens and data concerning the arboreal, terrestrial, and intertidal animal communities and populations. Particularly complete was the series of birds frequenting Bikini and the collections of mollusks of this and other of the Marshall Islands group. In June 1947 Dr. Schultz and Dr. Morrison, accompanied by Frederick M. Bayer, assistant curator of marine invertebrates, started on a return trip to Bikini for a resurvey of the faunal elements of the area with which they were particularly concerned.

AFRICA

The third Carpenter Africa Expedition of the Academy of Natural Sciences of Philadelphia began in November, 1947 when William K. Carpenter, the leader, accompanied by Harold T. Green, curator of exhibits, went by air to Nairobi, Kenya. There they will outfit and proceed through Uganda, the Belgian Congo, French Equatorial Africa, French Guinea, and Liberia. The objective is mammal specimens for habitat groups for the Academy's African Hall, motion pictures, and group accessories.

Mr. Carpenter led the second Carpenter Expedition to Africa in 1946, and in 1934 as a young man accompanied his father, R. R. M. Carpenter, on the first Carpenter Africa Expedition for the Academy. The expedition travels in three Chevrolet Trucks and a Chevrolet safari wagon, which were shipped out in July. Mr. Carpenter and Mr. Green are both veterans of the Army Air Forces, Second World War. The expedition will be in the field eight months.

Mr. and Mrs. William J. Morden and Kepler Lewis from the American Museum of Natural History, were in Africa to make extensive collections of ethnological material among some of the rapidly disappearing African tribes (Union of South Africa, southern and northern Rhodesia, Tanganyika Territory and Kenya Colony, Uganda, the Sudan and Egypt).

MISCELLANEOUS

The W. L. Abbott Fund financed three different field parties during the past year: M. A. Carriker, Jr., continuing field work in Colombia, working for half the year in areas complementary to those covered previously, obtaining 1,758 bird skins; Salim Ali of Bombay, collecting birds in Gujerat and other areas in India, supplementing the work of the Smithsonian-Yale University Expedition; and Dr. A. Wetmore and W. M. Perrygo making a trip to the interior of Darien, Panama, returning with 453 bird skins.

The Smithsonian Institution-Yale University Expedition to India, under the direction of Dr. S. Dillon Ripley, assisted by E. C. Migdalski, spent six months in various parts of India and in Nepal, and made a collection of birds which added very significantly to the Institution's resources in the Asiatic field.

Dr. W. F. Foshag and E. P. Henderson finished during the year their assignment in Japan, classifying and evaluating the large collection of gemstones assembled by the 8th Army of Tokyo for which task General MacArthur had requested their services.

OCEANOGRAPHY

By L. P. Disney

U. S. Coast and Geodetic Survey

HYDROGRAPHIC OFFICE

The work of the Division of Oceanography of the U. S. Navy Hydrographic Office during 1947 may be summarized as follows:

1. Preparation of specifications and reporting forms for use by personnel of the U. S. Navy, Merchant Marine, and other governmental and nongovernmental agencies involved in routine operations at sea, or conducting oceanographic research programs. These specifications and reporting forms are designed for the collection of data pertaining to surface temperatures and salinity; vertical distribution of temperature and salinity; sea, swell, and the associated meteorological data; bottom sediments; type, distribution, and movement of sea ice; and biological phenomena of the sea. A recent Special Observer's Log, incorporating the above factors has been designed so that the resulting data can be expeditiously transferred to IBM (International Business Machine) punch cards.

2. Procurement of equipment and personnel for oceanographic programs conducted during Navy sponsored expeditions. The Division was active in the procurement of equipment for various routine and special naval operations and in the procurement of both equipment and personnel for such operations as the 1947 and 1948 Antarctic Development Projects and various expeditions to the Arctic. With respect to the oceanographic equipment, considerable time has

been spent in an effort to standardize and raise the quality of various types of gear.

3. Assistance to non-Navy activities in the planning and implementation of oceanographic programs. Two examples of this type of assistance are the Philippine Fisheries Program (Office of Foreign Affairs, Fish and Wild Life Service) and the Greek Rehabilition Program (UNRRA).

4. Preparation of special reports in response to requests for oceanographic information by Naval and other governmental and non-governmental activities. Specific examples of these reports are "The Effect of the Variations of the Gulf Stream on the Fisheries Industry off the West Coast of Iceland," "The Distribution of Ice in The Antarctic," and a study of the most suitable time during the year to bring caskets through the surf at Iwo Jima. Also, special reports of a classified nature have been prepared for various military activities.

5. Arrangements were made for the publication of technical reports submitted by contracting agencies. Such reports as H.O.Pub. #602, "Wind Waves and Sea; Breakers and Surf" by Bigelow and Edmundson and H.O. Pub. #601, "Wind, Sea, and Swell; Theory of Relations for Forecasting" by Sverdrup and Munk are included in this category.

COAST AND GEODETIC SURVEY

The oceanographic work carried out by the Coast and Geodetic Survey in 1947 has dealt primarily with hydrographic surveys, adaptation of electronic devices to offshore surveying, the publication of a new series of charts, and an expanded program of tide and current investigations.

Hydrographic surveys on the Atlantic and Pacific coasts, together with deep sea sounding lines run by the Bureau ships returning from the Aleutian Islands across the Gulf of Alaska, have disclosed the following oceanographic features and geologic changes: (1) important additional submarine mountain data in the Gulf of Alaska; (2) the extreme flatness of the ocean bottom in the Bering sea north of Attu Island; (3) the continuing northward advance of the tip of Cape Henlopen; (4) shoreline recession on the east side of Chesapeake Bay.

Recent electronic developments were improved and adapted to Survey use during the year. Shoran was successfully used for moderate distances offshore both in the western Aleutians and on the Atlantic Coast. The Coast and Geodetic Survey electronic position indicator, previously developed and tested, was redesigned and rebuilt. With this equipment it will be possible to carry hydrographic surveys for about 200 miles beyond the limits of Shoran, thereby adding to the accuracy and efficiency of oceanographic investigation of the Continental Shelf and beyond.

Good progress was made on the project of charting the Gulf Intracoastal Waterway from Carabelle, Florida to the Mexican border. Seven of the charts have been published, and a number of others are in various stages of completion.

Primary and secondary tide stations were operated at 91 places in the United States and possessions and in foreign areas. A program for obtaining systematic tide observations in the western Pacific was inaugurated in cooperation with the Corps of Engineers. This project will furnish basic tidal data for many of the islands of the Pacific.

Daily readings of temperature and density of the sea water were obtained at 80 tide stations. Although restricted in scope these observations supply valuable data on average monthly temperatures and densities for the locality of the stations.

In the field of currents a comprehensive survey of tidal currents was carried out in Delaware Bay and River and a program of long series of hourly observations at lightship stations was inaugurated in cooperation with the Coast Guard.

The complicated movement of the tidal currents in the northern part of Puget Sound for each hour of the tidal cycle are depicted on tidal current charts for that area recently published by the Coast and Geodetic Survey. Also published during the year was a Seismic Sea Wave Travel Time Chart for the Pacific, centered on Honolulu, which permits a rapid determination of the probable time of arrival of a seismic sea wave originating in the Pacific.

COAST GUARD

No original oceanographic investigations were undertaken by the Coast Guard during 1947. There is now in press the annual reports of International Service of Ice Observations and Ice Patrol in the North Atlantic Ocean for the years 1942 through 1946. This publication will contain qualitative discussions of the ocean circulation in the northwestern Atlantic as observed from berg drifts and ice movements. It is hoped that the oceanographic program in connection with Ice Patrol may be underway by 1948.

SCRIPPS INSTITUTION OF OCEANOGRAPHY

Marine Biology.—Studies in this field have dealt with a variety of subjects, including examination of bacteria in marine sediments and the relation of their activity to the formation of petroleum, investigations dealing with the pigments in marine organisms and taxonomic and ecological work on fishes. Systematic investigation of the sessil marine plants is being started beginning with conditions in the coastal lagoons.

Submarine Geology.—With this field the emphasis has been placed on the study of processes of erosion particularly related to wave action. These studies also comprise examination of longshore and offshore transportation of sand.

Chemical Oceanography. — The work has been primarily directed towards development of instruments for rapid routine analysis. Such methods are becoming more and more needed as work at sea expands.

Physical Oceanography.—Emphasis has been placed on studies of wave motion, including tsunamis, on problems of large-scale diffusion, and on examination of the thermal structure of the surface layers of the sea by means of bathythermograph records. The effect of wind towards maintaining ocean currents is also under examination.

WOODS HOLE OCEANOGRAPHIC INSTITUTION

Hydrography.—Studies of the Gulf Stream were greatly facilitated by the use of LORAN (Long Range Navigation). Prior to the use of this instrument it was difficult to determine the geographical and relative position of the observations while working in or near the current. Large eddies associated with the Gulf Stream were successfully explored, and it was found that currents both in the Gulf Stream and in the eddies were much narrower and swifter than previously supposed. A recent theoretical study of this concentration of the streamlines in the west has shown that this is to be expected as the result of the Coriolis force acting over an area as large as the Atlantic Ocean. Studies similar to those mentioned in the paper, "Average Monthly Sea Surface Temperatures of the Western North Atlantic" (Contribution No. 387), are being made on the temperature at subsurface levels.

Marine Sediments.—During February and March, assisted by a grant from the Geological Society of America, the Atlantic secured 100 long bottom cores from deep water in the Gulf of Mexico and some 500 shorter samples. Some of the published results of this extensive study appeared in *Science* (106, No. 2759, pp. 460-461 Nov. 14, 1947).

Mid-Atlantic Ridge.—The geological, geophysical, and biological problems of the Mid-Atlantic ridge were studied with a grant from the National Geographic Society during a two-months trip in summer. Considerable success was achieved in bringing up samples of rocks from the steep slopes of the ridge. Seismic reflection measurements successfully determined the thickness of sediment on the ocean bottom at many points along the ridge and over much of the track from and to Woods Hole.

Biology.—A project is under way at Barnstable on Cape Cod to experiment in propagating and cultivating clams. Various methods already tried or suggested, including soil improvement and plowing of the soil, are being tested.

The department of microbiology extended the study of the viability of pollution bacteria in sea water. Studies of the New Bedford, Mass. sewer outfall have indicated that the mortality of the bacteria is at least as important as the rate of dilution by sea water in the reduction of the bacteria population.

Studies of the distribution and ecology of the marine bottom invertebrates are continuing. Some of the conclusions to which these studies have led are included in Contribution No. 374.

A general review of the existing information on the plankton of the western North Atlantic and a theoretical analysis of the principles of distribution is nearing completion.

The Scattering Layer.—Observations to check whether fish or shrimp are responsible for the false bottom echo received on ship sonic sounding devices have continued. Controlled experiments have resulted in echoes obtained from schools of shrimp.

Meteorology.—An analysis of low-level temperature and humidity measurements off the New England coast was published and a second paper discussing similar observations made further offshore is nearing completion.

Instruments.—Work is being continued, particularly in connection with devices to measure the electrical conductivity in seawater, for recording and analyzing waves and for measuring the direction and the velocity of ocean currents and depths. A new and improved design of the Spilhaus pressure actuated sea sampler has been completed.

OCEANOGRAPHIC LABORATORIES, UNIVERSITY OF WASHINGTON

The laboratories were more or less disorganized during the war years. They are now in operation but not to full capacity and they are still hampered by the lack of floating equipment. Much time was spent during the year in the preparation of manuscripts on material gathered prior to the war. However, at the present time some of the following studies are underway: 1. Evaluation of phytoplankton in the ocean by chemical means; 2. Study of radioactivity of oceanic bottom deposits; 3. Mineral composition of certain shell fish and various studies on marine vertebrates and invertebrates; 4. Bacteriological studies on the Pacific salmon.

PUBLICATIONS

Publications and papers on oceanography during 1947 are too numerous to include here. Lists of such contributions can be obtained from the Federal Agencies and Oceanographic Institutions covered in this summary.

DIVISION XXI

CHEMISTRY AND PHYSICS

PHYSICAL CHEMISTRY

By George M. Murphy
Associate Professor, Yale University

GENERAL

The American Chemical Society held its customary two meetings during the year: one in the spring at Atlantic City and, in the fall, in New York. Of interest to the physical chemist, in addition to many of the papers presented at each, were symposiums on the following subjects: chemistry of fission products, liquid phenomena, kinetics of propellants, purity and identification of organic compounds, high polymers, preparation and measurement of isotopes for use in biochemistry, ion-exchange separations. Selection of such topics for discussion is a good indication of the particular branches of the subject currently of interest.

NUCLEAR CHEMISTRY

As was to be expected, the various aspects of nuclear chemistry continue to occupy the attention of many physical chemists, and most of the university laboratories in the country sponsor some types of research in this field. On a larger scale, and as part of its function, the U. S. Atomic Energy Commission has established three laboratories for such studies. These are the Argonne National Laboratory at Chicago; the Brookhaven National Laboratory at Upton, L. I., and the Radiation Laboratory at the University of California. Other installations at Oak Ridge, Tenn., Hanford, Wash.; Los Alamos, N. M., and elsewhere continue in operation.

Radioisotopes, necessary for nuclear investigations, are available from the Atomic Energy Commission, and it has been announced that, after one year of this service, nearly 1,100 samples of more than 100 different isotopes have been supplied. Stable isotopes are also available from the same source. Separation is effected by electro-magnetic means, and more than 111 different nuclear species of 26 elements have been prepared.

A new journal in this field, entitled *Nucleonics,* made its appearance in September. It is devoted not only to chemistry and physics but also to biology, health physics, engineering, and technology. The existing issues of it contain papers of a review nature which should be useful for orientation purposes and to those who are relatively inexperienced in the field. For example, Coryell (Mass. Inst. of Tech.), in the October issue, reviewed techniques and accomplishments of nuclear chemistry, pointed out the importance of the subject for the nuclear power industry, and suggested fundamental problems for further exploration.

RADIATION AND PHOTOCHEMISTRY

The effect of radiation on chemical reaction has, in the past, been mostly studied with optical wave-lengths and techniques. Closely related is the effect of nuclear radiations such as neutrons, gamma rays, and nuclear particles. A review of this entire field was the subject of a symposium at

The University of Notre Dame, held in June, with 18 speakers on the program.

A separate review of photochemistry was given by W. A. Noyes, Jr. as the Presidential Address of The American Chemical Society at the New York meeting. The field of radiation chemistry alone is discussed by Burton (*J. Phys. and Colloid Chem.*, March 1947). The latter case is somewhat different from the former in that the available energies are so large with respect to chemical bond energies that bond rupture nearly always occurs. The nature of such recoil excitations and the kinetics of the situation are reviewed by Libby (University of Chicago).

RADIOELEMENTS IN NATURE

In addition to the well-known radioactive elements such as radium, uranium, thorium, and others, certain other long-lived radioelements occur in nature. It is certain that isotopes of potassium, rubidium, samarium, lutecium, and osmium belong in this class, and the existence of others (cadmium, indium, antimony, for example) may be inferred theoretically. A recent remeasurement of the half-life of radio potassium reduces that value by a factor of about seven and therefore increases its rate of energy production on the earth by the same amount. If substantiated, certain geochemical and geophysical conclusions must be re-examined. As a typical example, the period of duration of the earth's permanent crust must be decreased by about 1,000,000,000 years.

Every element with atomic number between 0 and 96 seems now definitely established, but nine of them are so radioactive that they have nearly or completely disappeared from the earth. The possibility of elements with atomic number greater than 96 is not excluded, but they will probably be difficult to prepare and study. Previous claims to the discovery of these elements are now generally regarded as untenable, but production of them in nuclear reactors or by nuclear reactions has resulted in considerable knowledge of their chemistry. Names assigned to them with their atomic numbers are as follows: the neutron, 0; technetium, 43; cyclonium or prometheum, 61; astatine, 85; francium, 87; neptunium, 93; plutonium, 94; americium, 95; curium, 96.

The possibility that elements are being constantly synthesized on the earth, due to the action of cosmic radiation, has been frequently discussed. One example is the formation of radiocarbon from a neutron reaction with atmospheric nitrogen. This has been detected by Libby, Grosse, and coworkers (University of Chicago and Holudry Process Corporation). Assuming that living carbon compounds would differ in radioactivity from similar compounds, which had been buried for times long compared with the 5,000 year half-life of radiocarbon, they compared the activity of biomethane, obtained from a city sewage disposal plant, with petromethane from oil wells. The former showed about 10 more disintegrations per minute per gram of carbon than the latter, corresponding to about 10^{-12} grams of radiocarbon per gram of carbon, or about 20 metric tons of radiocarbon on the earth. It is believed that the method can be extended so that carbonaceous material as old as 40,000 years may be detected and dated as to age. Such results would be of great interest to geologists and biologists.

Other radioelements are certainly formed in a similar way but Eidinoff (Queen's College) has shown that, if tritium, radioactive hydrogen, occurs in water, its abundance is less than one part in 10^{17}.

ION-EXCHANGE ADSORPTION

Chromatographic adsorption is becoming increasingly useful for the separation of mixtures difficult to resolve by ordinary chemical means. One application has been made at the National Bureau of Standards where a column, 16 meters long and filled with silica gel, has been used to separate synthetic mixtures of hydrocarbons and the kerosene fraction of petroleum.

The method has also been used to separate rare earths by Spedding and coworkers (Iowa State College) and by Boyd, Cohn, Tompkins, and others (Clinton National Laboratory). Such separations, long recognized as among the most difficult ones in inorganic chemistry, became of importance in the atomic bomb project since rare earth elements were among the major constituents of the fission products. The procedure used for this purpose is as follows: the rare earth mixture is completely adsorbed on a column of ion-exchange resin; elution from the column is effected by a complexing solution of citric acid, buffered with ammonia at a fixed pH; successive fractions of the eluate are collected, the least basic rare earths (those of higher atomic weight) being removed from the column first. Repetition of the process furnishes separated rare earths of purity greater than 99 per cent.

The method was investigated by radioactive tracer techniques, and among the process variables so studied were pH, flow rate, and concentration of the buffer solution; area and length of the adsorption column; concentration and maximum total amount of adsorbable rare earth mixture; particle size and composition of the resin; operation temperature. By suitably fixing all of these variables at conditions approximating an optimum, Spedding's group has succeeded in securing several kilograms of pure products. While the exchange process is vastly superior to classical rare earth separation methods of fractional crystallization, it should be noted that batch operation is necessary (maximum mixture adsorbable on the largest column used is 100 grams); large quantities of eluant are used (5 kilograms per 100 grams of rare earth); separation is slow (30-60 days). These objections to the method may be partly removed when further knowledge of the process is obtained.

Theoretical explanations of the adsorption mechanism together with an account of the experimental results, have been given in 12 papers presented at the New York meeting of the American Chemical Society (*J. Am. Chem. Soc.,* Nov. 1947).

MOLECULAR STRUCTURE AND SPECTROSCOPY

Accounts of the status and recent achievements in the field of molecular structure and forces were given by Kistiakowsky (Harvard University), when he received The Nichols Medal, and by Pauling (California Institute of Technology) in the Richards Medal lecture at Cambridge and in a Silliman lecture at Yale. Both lecturers were especially stimulating in their references to unsolved problems.

One of the most powerful techniques in such problems is that of molecular spectroscopy since it not only gives information as to internuclear forces and distances but also the exact numerical thermodynamic data, so useful to the physical chemist. Unfortunately, the complicated polyatomic molecules of most interest have such complex spectra that they are difficult to understand. A symposium on molecules of this sort, especially with reference to their color, summarizes present knowledge of them (*Chem. Reviews,* Oct. 1947).

A relatively simple part of the spectrum is that due to pure rotation of the molecule but because of optical difficulties in the far infrared when these spectra occur, the region has been almost inaccessible to experiment. Wartime developments in radar and electronics now allow such measurements to be made with more ease, and considerable work in this field appeared during the year.

Known as microwave spectrometry, the wavelengths employed are around 1 cm., and several variations of the apparatus have been constructed or proposed. Laboratories from which the work is appearing include those of Harvard, Ohio State, Duke, Westinghouse, and Bell Telephone. A number of different molecules have been studied. The results yield molecular shapes, internuclear distances, moments of inertia, isotope effects, nuclear spins, and quadruple moments. Certain anomalous effects and splitting of the spectral lines have been explained theoretically with almost complete success.

Some of these effects may also be obtained by the molecular beam-magnetic resonance and by the nuclear induction methods, both of which have been further studied and modified during the year. However, it appears that the microwave spectra will be the most generally useful for determination of nuclear spins. This is particularly true for the case of artificially radioactive elements, where the small samples available and other limitations will make the experiments difficult in any case.

DIFFUSION

When two or more different gases mix by molecular diffusion, the situation is theoretically somewhat complex. A simpler case is that of the diffusion of a gas into itself, and here tagged molecules are experimentally essential. This phenomenon has been studied for both uranium hexafluoride and methane (University of Virginia). Tagging was effected by the use of separated isotopes and analysis by the mass spectrometer. Similar experiments with argon (Yale University) used radioargon as tracer and counting methods for analysis. Such results furnish information on intermolecular force laws.

For solutions, the interesting cases are diffusional flow between two different concentrations of solute, either with or without a permeable separating membrane. Reviews of these aspects of diffusion have been given by Harned, Yale University (*Chem. Reviews*, June) and by Dean, University of Hawaii (*Chem. Reviews*, December). Radioactive techniques, with radiosodium, are used by Adamson (Univ. of Southern Calif.) and by Robinson and Drew (Howard University). This method has the advantage that it may be extended to diluter solutions than those studied by other methods. It is also one of the few possible means for investigating individual in behavior.

An optical method, involving the measurement of interference fringes, has been further developed experimentally by Longsworth (Rockefeller Institute) and theoretically by Kegeles and Gosting (Univ. of Wisconsin). The method may be used for electrolytic solutions and also for the study of proteins.

Another method, devised by Harned, utilizes a carefully machined lucite cell, designed according to theoretical requirements. The diffusion coefficient is determined by conductance measurements at two pairs of electrodes and the precision attained is 0.1 per cent. Previous methods have been much less sensitive, and thus it is now possible for the first time to make reliable comparisons of the theory with experiment.

PHYSICS

By Thomas H. Osgood

Professor, Michigan State College

GENERAL

In reviewing the Physics literature of the year 1947 it is desirable to distinguish between what is novel, in the sense of having been discovered recently, and what is new, in the sense of having been released for publication by those responsible for preservation of security in connection with researches conducted during the Second World War. A very large part of the confidential scientific work carried out during the war has now been "declassified." In the field of nuclear physics there remain on the secret list some numerical constants which might help anyone engaged in the preparation of atomic bombs.

Recently published is a series of papers on delayed neutrons created during the process of fission, a subject of great importance in the design of chain reacting piles, but the date of the work itself is 1942-44.

ACCELERATING MACHINES

To the reader who keeps abreast of current trends in physical science, the terms cyclotron and betatron are already familiar. They denote machines for the acceleration of atomic particles to velocities approaching that of light. The cyclotron was devised to handle ions such as protons, deuterons, and alpha particles; the betatron accelerates only the much less massive electrons.

Modifications of these two instruments have been discussed theoretically in the literature for nearly two years, with the purpose of creating beams of particles of greater energy than the standard instruments could attain. The modification consists in adding the synchrotron principle, often called the principle of phase stability, to the machines in their conventional form, following an idea suggested independently by V. Veksler in Russia and by E. M. McMillan in the United States. The modified instruments are now called synchrotrons when their use is restricted to electron acceleration, and synchro-cyclotrons when the design is for the acceleration of ions only. The most notable example of the latter type is the 184-inch instrument in the Radiation Laboratory of the University of California. The 184-inch dimension indicates the diameter of the two circular pole pieces.

Although this instrument was originally planned as a conventional cyclotron, it has been adapted to the synchro-cyclotron principle, and the latest developments are contained in two important papers appearing in the *Physical Review.* The first of these, by D. Bohm and L. L. Foldy (*Physical Rev.* 72, 649) treats the theoretical aspects of the problem of starting an ion beam in the accelerating chamber. The second, by W. M. Brobeck, E. O. Lawrence, K. R. MacKenzie, E. M. McMillan, R. Serber, D. C. Sewell, K. M. Simpson, and R. L. Thornton (*Physical Rev.*, 71, 449) records the initial performance of the instrument. That the work of eight scientists can be recorded within the limits of a two-page article is merely a sign that modern physics deals with such large and complex machines that a whole team is required to design, adjust, and maintain each of them.

The principle of phase-stability is applied to the 184-inch cyclotron by modulating, or varying continuously over a range of about 20 per cent, the frequency of the high voltage applied to the dees. This is accomplished by including in the resonant circuit a rotating electrical condenser which can be operated up to 2000 cycles per second, though this maximum rate of modulation has not yet been needed.

Tests have been made with hydrogen ions (protons) and with helium ions (alpha particles), and though direct measurements of the energies reached have not been made, it is expected that these will reach 195 and 390 million electron volts respectively. The latter figure is exactly twice the former on account of the double charge carried by the alpha particle. The energies fall in the range which is theoretically needed to carry out systematic experiments on the production of mesons. Since knowledge of the meson's properties appears, at the moment, to be the key to a proper understanding of the forces in the nucleus, reports of experiments, planned or performed with particles from the synchro-cyclotron are awaited eagerly.

Although the pole pieces are 184 inches in diameter, it has not yet been possible, with this large instrument, to use the whole of the inter-polar volume effectively. For a variety of reasons, difficulties occur in keeping the ion beam up to full strength as it spirals outward from the center of the dees. These difficulties have not yet been overcome completely. The ion beam is good as far as a diameter of 80 inches, after which it falls rapidly, and is lost at 164 inches.

Other important accelerating machines, whose construction was planned or under way in 1946, are not yet reported complete. But these machines take so long to build that it is almost necessary to plan the next one before the previous one has been put through its paces. Columbia University is currently busy with preliminary work on a 450 million-volt synchro-cyclotron, and larger instruments of the "race-track" variety are being designed to reach the billion volt mark.

THE URANIUM PILE

The active material of an atomic bomb, either uranium 235 or plutonium, must be separated or manufactured in pure form from natural uranium. During the Second World War the preparation of these materials on a military scale was carried on only in the United States although scientists of other nationalities were called in to help. Plutonium is one of the final products created in a chain-reacting pile, usually of uranium and graphite. Since 1945, Great Britain has set up her own Atomic Energy Research Establishment at Harwell, where a uranium-graphite pile was operated for the first time in Europe in August 1947. An account of this event under the encouraging title "Peaceful Applications of Nuclear Fission" was carried by *Nature* (160, 451, 1947) in the form of a report of speeches made by J. D. Cockroft and others at the British Association Meeting in Dundee. Cockroft, the director of the Establishment, emphasized that the pile is a potential though not a certain new source of power for the world. The low-power pile of Harwell, designed for experimental work only, contains several hundred tons of graphite, and probably a few tens of tons of uranium. So dense is uranium, however, that only about one per cent by volume is composed of that metal. Surrounding it is a concrete shield about five feet thick. Loading the pile, which means inserting uranium in spaces purposely left in the graphite, occupied ten days. During loading, the neutron flux increased steadily, and towards the end, very rapidly, as the multiplication constant increased towards the critical value, unity. The course of the neutron multiplication can best be judged by the neutron flux registered by a counter inside the pile. After two days, with seven tons of uranium loaded, the count was 17 per minute; four days later, 55 per minute; a few hours before completion, 2,400 per minute; and at the threshold of the critical stage, 6,600 per minute. The pile was then tamed by inserting the necessary control rods of cadmium, or boron-carrying material. At this stage only 0.1 watt of heat was generated in the whole enormous pile. From this point, the pile would, if left to itself, climb exponentially but very slowly to higher power levels on account of the cumulative effect of delayed neutrons which accompany fission. Later, the power was intentionally increased to 100 watts, whereupon the pile was shut down, having achieved its maiden multiplication successfully.

In the future it is planned to raise the power level of this pile to something of the order of 50 kilowatts. Under these conditions there will be at the center a neutron flux of one billion per square cm per second, of which one per cent will be available for making radioisotopes for scientific work. The other 99 per cent are required to keep the pile going. Despite its great mass, a pile is remarkably sensitive. Cockroft reports that introducing one-tenth of a milligram (one five millionth of a pound) of cadmium makes a detectable difference in the power level. Cadmium is, however, one of the most powerful inhibitors known.

A second pile for the study of power production is to be built at Harwell, using uranium sheathed in aluminum, to prevent oxidation and escape of fission products. The presence of aluminum sets a serious limitation on the use of a pile for power production (*via* steam) since it is thermodynamically impossible with ordinary condensers to achieve high efficiency in a steam turbine operated at a temperature low enough to preserve the essential properties of the aluminum sheathing. This second pile is planned for 1000 kw, which will permit about 1 gm of useful fission products to be manufactured per day as a side-line.

NEUTRONS

Information describing the interaction of neutrons with matter is often given in terms of cross-sections. A neutron cross section of (say) gold represents the effective target area which one atom of gold presents to oncoming neutrons. Typical cross sections lie between 10^{-21} and 10^{-24} cm^2 per atom. The values, however, vary enormously from element to element, and are strongly dependent upon the velocity of the neutrons. The most important recent publications on this subject deal mainly with comparatively slow neutrons, in the energy range 0-100 electron volts. Emphasis has been placed on slow neutrons since 1940 partly because it is upon these that the action of the chain-reacting uranium pile depends, and partly because nuclear transmutations in general are usually carried out more readily with slow than with fast neutrons.

Since the variation of cross section with neutron-speed is often very rapid, it is desirable to carry out experiments with beams of neutrons identical, or very nearly identical, in energy. There are now several standard methods of achieving this. Oldest is the time-of-flight method extensively used for many years at Columbia University, and by which William B. Jones, Jr. (*Physical Rev.* 72, 362) at Cornell University recently measured cross sections in iodine. The method requires a cyclotron with which neutrons are produced and is useful from 0 to 500 electron volts energy. If the cyclotron is suddenly shut off, then neutrons will cease to be generated, and the last ones will arrive at a collector several meters away at different times, depending on their speed, the slowest ones arriving last. By means of complicated electronic timing circuits, it is possible to count those neutrons which arrive at the collector at certain times, and to discover how the proportions vary when some substance to be tested is put in the neutron beam close to the source. William B. Jones, Jr. found, for example, that the cross section of iodine was about 5×10^{-24} cm^2 per atom at 15, 25, and 50 electron volts energy, but in between, at 20 and 35 electron volts, the values were many times as great. These high values at certain energies indicate "resonances," or energies at which the iodine nucleus is an especially easy mark for the approaching neutron.

So-called thermal neutrons, moving with speeds comparable to those of gas molecules at ordinary temperatures, have been studied extensively with mechanical velocity selectors. This is possible because they move so slowly. A typical velocity selector is the one used by E. Fermi, J. Marshall and L. Marshall (*Physical Rev.* 72, 193). A velocity selector must contain a shutter which operates in such a way as to let short bursts of neutrons pass through. The shutter in this case consisted of a multiple sandwich of thin cadmium sheets and aluminum sheets which could be rotated at high speed about an axis passing through the middle and parallel to all the layers. For neutrons possessing effective temperatures of the order of a few hundred degrees, like those emerging from a hole in a graphite pile, aluminum is practically transparent, while cadmium is an excellent absorber. Slow neutrons could therefore pass through the sandwich only while its layers were parallel to the flow of neutrons from the pile. At other times while the shutter was being rotated, no neutrons could pass.

About 1.5 meters from the shutter, neutron counters were set up in the line of flight of the particles. These were arranged to be active only for a prearranged short period at a controlled time interval after the shutter was in the open position. Thus the counters could, within limits, record neutrons which had required any desired time interval to pass from the shutter to the counter; that is, neutrons of specific velocities could be investigated. When a comparatively small piece of new material was introduced into the path of the beam of neutrons just in front of the shutter, then certain changes occurred in the relative numbers of neutrons of different classes which reached the counters. On the basis of such measurements it was not difficult to calculate the cross section or effective target area per atom of the materials investigated. Boron, for example, turned out to have a cross section of 700×10^{-24} cm^2 per atom for neutrons of velocity 2,200 meters per second. This corresponds to a temperature of 20° centigrade.

The velocity selector just described was elaborated and improved by T. Brill and H. V. Lichtenberger (*Physical Rev.* 72, 585). With it they measured cross sections of gold and some rare earth metals over the range 0.003 to 0.2 electron volt, corresponding to velocities from 800 to 6,000 meters per second. Over this range the cross sections of gadolinium varied from 1.2×10^{-19} cm^2 per atom to 2×10^{-21} cm^2 per atom, illustrating the general rule that the slower a neutron moves, the more likely it is to interact with a nucleus.

In accordance with wave-mechanics, any mass-particle in motion has associated with it a wave length given by the relation $\lambda = h/mv$, where λ is the wavelength, h is Planck's constant of action, m is the mass of the particle, and v its velocity. It happens that for neutrons of moderately low energy, not more than a few electron volts, the wave lengths are of the same magnitude as those of x-rays. Consequently the diffraction of neutrons, and the production of beams of monochromatic neutrons can be accomplished by crystal reflection. Two important types of x-ray spectrometer, the Bragg type, and the Cauchois focusing type have been adapted for use with neutrons. With the former, William J. Strum (*Physical Rev.* 71, 757) has measured cross sections for more than half a dozen elements, using the powerful beam of neutrons from the heavy water pile of the Argonne National Laboratory. On the other hand, the Cauchois focusing instrument, furnished in this case with a bent sodium chloride crystal, has been used at the Clinton Laboratories at Oak Ridge by R. B. Sawyer, E. O. Wollan, S. Bernstein, and K. C. Peterson for much the same kind of studies. Further work needs to be done, for where the work of these two laboratories overlaps on this subject, there is qualitative but not quantitative agreement in the results.

No techniques are yet available for handling neutrons of energies between fifty thousand and a million electron volts with the delicacy of the work which has been done on slow neutrons. Yet this region is full of interest, and its exploration will lead to a better knowledge of energy levels within the nucleus. An introduction to what has already been accomplished can be found in a paper by L. W. Seagondollar and H. H. Barschall (*Physical Rev.* 72, 439) in which the cross section of aluminum is reported for neutrons up to 1 Mev. In this range, no fewer than ten peaks occur, the cross section varying up and down by 40 or 50 per cent from an average value of about 4×10^{-24} cm^2 per atom. These values, it may be noted, are thousands of times smaller than those for slow neutrons for gadolinium. Each of the peaks mentioned represents a condition at which the aluminum nucleus shows a preference for catching neutrons, or at least diverting them from their straight flight. Heavier elements than aluminum might be expected to respond to passing neutrons in an even more complex fashion.

MESONS

In 1946 there was some evidence that mesons which were observed by their tracks in cloud-chambers possessed a variety of masses ranging from about 20 to 200 electron masses. A careful examination of the possible errors of interpretation arising in cloud-chamber measurements, and some experiments of William B. Fretter (*Physical Rev.* 70, 625) show that the evidence was misleading. Fretter photographed the same mesons in two cloud chambers, one traversed by a magnetic field, the other obstructed by a series of absorbing lead plates. By combining measurements in pictures of both chambers, he concluded that the mesons encountered in his experiment had a unique mass, 202 times the rest mass of the electron. This, however, is far from being the last word of the story of mesons.

A group of workers at the University of Bristol (*Nature,* 160, 453) has been carrying out a program of cosmic ray particle research by making mosaic microphotographs of the tracks of particles formed in photographic plates exposed to cosmic rays. They have shown that charged mesons, brought to rest in the emulsion, commonly lead to the production of secondary mesons, all of which appear to have identical masses, and to be produced with identical initial kinetic energies. A significant difference in grain spacing along the tracks is found for the primary and secondary mesons. From their observations the group at Bristol feel obliged to dismiss as untenable the explanation that the secondary mesons are produced as a result of spontaneous decay of the primary meson, during which process a photon or neutrino would be emitted. They incline to the view that the tracks they have been examining are caused by mesons emitted at the same time as other neutral particles of about 200 electron masses.

SEPARATION OF ISOTOPES

For the furtherance of detailed knowledge of nuclear structure it is necessary to study nuclear species singly. This often involves the separation of isotopes of the same element, a separation which can not be achieved by chemical methods, but which can be achieved by established electromagnetic or diffusion processes either in very small quantities or with tremendous effort. New schemes for the separation of isotopes are, therefore, of considerable interest even if their application is initially somewhat limited in range. A novel method of isotopic separation of He^3 and He^4 is described by J. G. Daunt, R. E. Probst, H. L. Johnston, L. T. Aldrich and A. O. Nier (*Physical Rev.,* 72, 502).

Liquid helium II (the Roman numeral refers not to atomic mass but to a special phase in the thermodynamic sense) is the most remarkable liquid known. Among its unusual properties, it possesses an ability to creep over surfaces in invisible thin films, even without benefit of gravitational potential energy, at an astonishing rate. The literature describes this as super-fluid flow through a supra-surface film. It occurred to the five investigators that if, as J. Franck suggested, only common He^4 atoms play a part in super-fluid flow, then He^3 atoms would be left behind in a vessel from which liquid He^4 II had been abstracted by flow along a supra-surface film. Accordingly they prepared a small glass vessel, closed it with a ground stopper, and placed it inside another vessel so that its lower part only was immersed in liquid helium II contained therein. All this had to be done, of course, below the λ-point, close to 2° K. The superfluid was able to flow through the narrow channel between the male and female parts of the stopper, which nevertheless was an effective seal against the return of any vapor. All that remained to be done was then to measure, with a mass-spectrometer, the isotopic constitution of the liquid which collected in the inner vessel. The investigators found that this helium, after having been processed by super-fluid flow, contained only He^4 atoms. The original supply, therefore, must have been left with a correspondingly increased number of He^3 atoms. Not only does this experiment prove, within the limits of measurement, that He^3 does not partake of superfluid flow at the temperatures at which He II is ordinarily manipulated, but it explains certain uncoordinated results previously obtained by two groups of experimenters who measured the isotopic ratio of He^3/He^4 above and below the λ-point. The clue to the difficulty is that a certain amount of super-fluid flow and subsequent evaporation must necessarily take place in most experiments dealing with liquid helium II, thus changing somewhat the proportion of He^3 atoms present.

THE UPPER ATMOSPHERE

German V-2 high altitude rockets were fired from time to time in 1946 and 1947 by the Ordnance Department, United States Army, at its proving grounds, White Sands, New Mexico. Physicists of the Naval Research Laboratory have been able to take advantage of these flights to explore the upper atmosphere with more accuracy than was possible heretofore. Pressure and temperature, solar radiation, and cosmic ray intensity have been studied particularly. Some new data relating to the first two items are summarized here.

To cover the range of pressures between ground level and 120 km, three types of gauges were required—bellows gauges, useful from normal atmospheric pressure to 1.0 cm. of mercury, Pirani gauges, from 2 mm. to 10^{-2} mm. of mercury, and Philips gauges for still lower pressures. In agreement with theory, the logarithm of the reciprocal of the pressure was found by N. Best, R. Havens, and H. LaGow (*Physical Rev.* 71, 915) to be proportional to the altitude. Indications of a slight departure from this linear relation were found between 50 and 70 km. At 120 km. the atmospheric pressure is only one ten millionth of its value at sea level.

Temperatures were estimated by the same authors from the known relationships among the uncorrected readings of the various pressure measuring instruments used, and the results were compared with data taken from "Tentative Tables for the Properties of the Upper Atmosphere," a 1947 publication of the National Advisory Committee for Aeronautics. These tables are apparently reliable to 50 km. At higher levels the new experiments gave values varying from 30 to 50 degrees C. lower than the N.A.C.A. estimated mean temperatures. As is well known, the temperature does not fall steadily with increasing altitude. There is a minimum (—60° C.) at about 25 km., a maximum (+60° C.) at 50 km, and another minimum (—80°) at 80 km, and thereafter a steady increase.

This curious variation of temperature with altitude is, of course, connected with the absorption of solar radiation. A group of workers at the Naval Research Laboratory have published spectrograms (*Physical Rev.* 70, 781) obtained with a rugged, specially built grating spectrograph which was recovered from the debris of the rocket fired on Oct. 10, 1946. As the rocket rose to higher and higher altitudes, the solar spectrum extended farther and farther into the ultra-violet. At 55 km. there was a faint record even at wave lengths somewhat shorter than 2,200 A. At 34 km. the spectrum was recorded above and below the region of the strong ozone absorption band at about 2,400 A, but none at the position of the band itself. In rising another 21 km, the rocket left enough of the atmospheric ozone behind it to make a continuous record throughout this Hartley band. A complete analysis of the spectra will provide information concerning the distribution of ozone and other absorbing gases in the atmosphere.

Later experiments in a rocket flight on March 7, 1947 supplied spectrograms with much better resolution than in the first trial. In these, about 300 regions or lines of absorption were decipherable the majority of them due to iron in the sun's atmosphere. Such a record at 75 km gives a truer spectrum of solar radiation than has ever been photographed before.

A NEW COUNTER

Individual charged particles of high energy, and gamma rays are usually detected electrically by tube counters through which the particles can travel completely. Alpha particles of moderate energy, on account of their low penetrating power, must be permitted to enter through a special thin window, or else the alpha-emitting material must be put inside the counter.

A simpler alpha particle counter would be a great convenience.

Following an unsuccessful experiment of Van Heerdeen (1945), D. E. Wooldridge, A. J. Ahearn, and J. A. Burton (*Physical Rev.* 71, 913) bombarded a small diamond with alpha particles, and arranged two separate electrodes in intimate contact with the diamond surface. A potential difference was maintained between these two electrodes, forming part of a circuit whose output was fed to a cathode ray oscilloscope. They found that good pulses were obtained. In one series of experiments they bombarded with alpha particles a clean strip of diamond surface only 0.003 cm wide between two evaporated metal areas which formed the electrodes. Only five volts were needed to produce pulses across this gap. In another arrangement, they obtained pulses with 100 volts between evaporated films on opposite sides of a diamond 0.5 mm thick. Only selected diamonds reacted in this way. In the former case, the conductivity was a surface phenomenon; in the latter, apparently a volume effect. If the counter turns out to be reliable, it will be a very convenient accessory in laboratories devoted to the study of nuclear physics.

L. F. Curtis and B. W. Brown (*Physical Rev.* 72, 643) have given diamonds a trial as gamma ray counters. Each crystal was held in a simple compression mounting between two metal electrodes pressed against opposite crystal faces. No evaporated films were used. On irradiation with gamma rays from radium, two diamonds out of about one hundred of the industrial variety were found to give adequate pulses for counting. Since the absorption of gamma rays per unit area of target surface in a piece of diamond is greater than in a conventional tube counter, further development of this technique appears desirable.

ORGANIC AND INORGANIC CHEMISTRY

By C. M. Suter
Associate Director of Research, Sterling-Winthrop Research Institute

---

AMERICAN CHEMICAL SOCIETY

The increasing importance of science in American civilization is well illustrated by the remarkable and continued growth of the American Chemical Society. Some 55,000 members are now on its rolls, and the meeting of the society in New York last September was attended by a record of 11,000 persons. If the plans for future expansion of scientific activities in the United States follow the program outlined by Mr. Steelman in his report to President Truman one may expect the Society to double again in size by 1960. This report advocates a national expenditure of 1 per cent of income on research amounting to $2,000,000,000 per year by 1957. Present research expenditures are only one half of this.

PUBLICATION PROBLEMS

This tremendous and growing membership brings with it serious problems in the publication field particularly during a period of paper shortage with which we are still afflicted. Hence every journal is filled with papers to the limits of its resources, and backlogs indicating delay are being accumulated. It is clear that facilities for publication of papers must be further expanded within the society or groups of its members will take steps to provide such facilities in other ways. It may be necessary to obtain aid from the National Science Foundation or other government source before the problem is adequately solved. Since, however, government subsidy might develop into a measure of control it seems undesirable to ask for this help except as a last resort. The number of pages in the *Journal of the American Chemical Society* is running about 20 per cent above 1946 but this is still below prewar years and is clearly inadequate in view of the increased number of chemists doing research work.

Publication difficulties are much more serious abroad than in the United States, and the resulting lack of exchange of ideas between scientists on an international basis constitutes a serious handicap to research. Discussion of this problem is frequent in scientific circles. (See editorial, *Industrial and Engineering Chemistry,* September, 1947).

ATOMIC WEIGHTS

An indication of renewed international cooperation is the Thirteenth Report of the Committee on Atomic Weights of the International Union of Chemistry which appeared in 1947, the first report since 1943. However, changes in atomic weight values now occur rather infrequently and then are small. The 1947 Atomic Weights Table changes the value of copper from 63.57 to 63.54 and that of sulfur from 32.06 to 32.066. The atomic weights for the four new elements synthesized by radioactive means, namely neptunium, plutonium, curium, and americium have not yet been officially assigned.

FLUORINE CHEMISTRY

The impetus given to fluorine chemistry by certain projects related to the war effort is still in evidence through publications and new products. An interesting new compound, fluorine perchlorate, has been described by Cady (University of Washington). It is formed as a gas by the action of fluorine upon perchloric acid. Liquefaction occurs at —16° C. but usually an attempt to freeze the liquid results in an explosion. This property is a most unusual one. Explosion of the gas also results from a small flame or spark, or when it comes into contact with specks of dirt, rubber tubing, and other miscellaneous materials. Reaction with aqueous alkali yields oxygen gas.

Another interesting fluorine compound, fluorine trichloride, has recently been made commercially available. The extent of its industrial usefulness remains to be determined.

LITHIUM ALUMINUM HYDRIDE

An interesting and useful new hydride is obtained when lithium hydride and aluminum chloride are allowed to react in ether solution (Finholt, Bond and Schlesinger, University of Chicago). The product, lithium aluminum hydride, can be isolated free of ether, whereas aluminum hydride itself is unstable. Lithium gallium hydride may be obtained by a similar procedure. Sodium and calcium aluminum hydrides have been made but not yet described in the literature. The existence of these new hydrides raises a number of interesting questions regarding valence bonds, but in addition, lithium aluminum hydride gives promise of being a useful reagent in effecting reduction reactions hitherto impossible or impractical. The hydrides of silicon (silane) and tin (stannane), as well as alkyl derivatives, become more readily available; the previously unknown hydrides of zinc and beryllium have now been made in easily controlled reactions. Perhaps more important are the results obtained in organic chemistry. Even carbon dioxide is reduced to formaldehyde. Carboxylic acids, (Nystrom and Brown, University of Chicago), as well as acid chlorides, anhydrides, and esters are converted to alcohols. Aldehydes, ketones, nitriles and nitro compounds also undergo reduction. On the other hand, many olefinic bonds are not attacked, making possible interesting specific reduction reactions of unsaturated compounds containing other functional groups. The results obtained are somewhat similar to those from the action of sodium and alcohol but the reaction conditions are more convenient. Amino and hydroxy groups already present do not interfere with the reaction.

URANIUM HYDRIDE

The revival of interest in uranium chemistry has led to interesting observations regarding this element. Rundle (Iowa State College) reports that uranium forms a definite compound, UH_3, with hydrogen. This hydride does not seem to fall in the three known classes of these compounds. It has metallic properties, yet is unlike the known crystalline forms of uranium. The melting point has not been determined but is certainly above 600°; unlike the metal itself the hydride is brittle. Rundle proposes that the compound is held in the crystalline state by hydrogen atoms acting as bridges between uranium atoms. It is suggested that other metallic hydrides, which have similar properties, may be found. In a detailed report (Burke and Smith, Los Alamos Scientific Laboratory) on the method for preparing the hydride, a temperature of around 225° was shown to be optimum. Dissociation of uranium hydride into its elements is complete at atmospheric pressure at 425°.

GERMANIUM COMPOUNDS

The recent rapid development which has occurred in the industrial utilization of silicon compounds has stimulated interest in germanium, another element of group IV of the periodic system. Rochow (General Electric Company), who was a pioneer in the development of industrial organic silicon derivatives, has now reported on a method for preparing organogermanium halides from the action of alkyl halides with metallic germanium. The presence of reduced copper greatly facilitates the reaction just as it does the corresponding reaction involving silicon. The chemistry of germanium compounds is in too elementary a state for any prediction to be made as to possible utility of organogermanium compounds.

INDUSTRIAL OXYGEN

During the past two years there has been an increase in interest in the manufacture of oxygen suitable for various industrial purposes. With the prospect of greatly reduced costs, its field of potential use has been broadened. In part the renewed activity in this field was the result of the need for oxygen-generating units for use in military operations where it was inconvenient to utilize steel cylinders. Plants having capacities from 10 to 1000 tons per day are now planned at a cost of $5 per ton of oxygen for a small plant and much less for larger ones where 95% oxygen is needed. By the use of oxygen instead of air, the processing of four tons of nitrogen for every ton of oxygen needed in a process can be avoided.

RARE EARTH SEPARATIONS

The complex problems presented by the need for detailed information regarding the fission products of uranium obtained as by-products in the production of plutonium have stimulated research in inorganic chemistry in a remarkable manner. Many publications are now appearing which deal with results obtained under Manhattan Project contracts. One important series of publications deals with the separation of radioisotopes produced in the fission process by means of ion-exchange resins. The process involves the removal of an element from a column of an ion-exchange resin by the use of a reagent which converts the ion of the element into a complex without having a similar effect on other ions present. These ion-exchange resins are similar to those employed in water softening installations for removing the calcium responsible for the hardness of the water. This new technic has made possible the separation of elements present in minute amounts in the mixture obtained from the chain-reacting pile where at least 14 products are present. It has also made possible the separation of the rare earth elements from mixtures in which they commonly occur. Formerly this could be accomplished only by tedious and prolonged fractional crystallization procedures. Furthermore the process is applicable to large scale operations, and hence it may be possible to make rare elements which were previously only museum items available for general research and development. Several papers have been devoted to theoretical aspects of this new technic, but the arguments involved are too complicated to be presented here. One can only look upon the use of ion exchange resins in the development of the plutonium bomb as another instance where the technological society of which we are a part was prepared to handle quickly an unexpectedly difficult problem.

CHEMICALS FROM PETROLEUM

During the early history of the organic chemical industry almost all synthetic operations started with raw materials obtained from coal tar. The chemistry of "aromatic" compounds, *i.e.* those derived from benzene, developed rapidly, furnishing dyestuffs, explosives, and pharmaceutical products. This earlier development of chemical industry took place primarily in Germany and to a lesser extent in England, being transplanted to this country after the First World War. In 1925, on a tonnage basis, 68 per cent of the production of organic chemicals was of the aromatic type (McClure and Bateman, Carbide and Carbon Chemicals Corp.), indicating that aliphatic compounds were already becoming of some industrial importance.

At one time petroleum was valuable only because of the various fuels and lubricants that could be obtained from it, largely by physical methods. In recent years, however, there has developed a chemical industry based on petroleum as a raw material which now is overshadowing in volume the products obtained from coal tar. In 1946, for example, chemicals obtained from petroleum sources amounted to over 3,500,000,000 pounds. Interestingly enough, important items in these petroleum products included toluene and xylene, aromatic hydrocarbons hitherto derived primarily from coal tar. Another consequence of this increase in importance of petroleum chemicals is the present dominance of aliphatic chemicals, 65 per cent on a tonnage basis in 1945 belonging in this category.

The production of chemicals from petroleum now promises to increase at an even more remarkable rate. One reason is that the raw material supply is more than abundant and the cost is low. Production of coal tar crudes is seriously limited, on the other hand, by the rate of coke manufacture for steel needs. Most of the ethane available from petroleum is now burned as fuel. It has been estimated that conversion of this into ethyl alcohol would increase the production of this item by a factor of fifty. Another interesting example is the estimate that enough hydrogen sulfide is obtainable from petroleum refining operations to supply all the U. S. requirements for sulfur. The most important new development, however, is the use of the Fischer-Tropsch process for the synthesis of gasoline which will soon get under way on a moderate scale. This operation will yield a tremendous amount of many organic compounds as by-products. For instance there will be about 4 per cent as much ethyl alcohol formed as there is synthetic gasoline (Ayres, Gulf Research and Development Co.). In addition, methanol and also alcohols of higher molecular weight will be produced as well as aldehydes, ketones, and acids in profusion. At least some of these will be available at prices which will broaden their industrial use in a marked degree. The Fischer-Tropsch units already under construction will provide about 0.5 per cent of the motor fuel requirements of this country. It is estimated that the aliphatic chemicals from these units alone will amount to 300,000,000 pounds annually. Although these compounds arise as by-products in the manufacture of gasoline they may still be considered as derived from petroleum since natural gas is the raw material for these first Fischer-Tropsch units.

BUTADIENE

Much of the butadiene needed for synthetic rubber during the war was produced from ethyl alcohol because the preparation from petroleum involved a more complex process and was slow in getting under way. Furthermore, the Russian synthetic rubber is apparently entirely derived from butadiene obtained from alcohol. The importance of the alcohol-butadiene reaction led Quattlebaum, Toussant and Dunn (Carbide and Carbon Chemicals Corporation) to study its mechanism which they have now completely determined. Over a silica gel catalyst activated by traces of other elements alcohol is first dehydrogenated to acetaldehyde, two molecules of which in turn readily condense to yield crotonaldehyde. Crotonaldehyde then is acted upon by alcohol to afford butadiene and acetaldehyde. In effect, the oxygen atom of the crotonaldehyde is removed by the alcohol. This new reaction was then tried on other aldehydes and ketones. In one of these experiments it was found that acetophenone could be converted to styrene by alcohol and the silica gel catalyst. It is not likely, however, that this method of preparing styrene (also needed for synthetic rubber) is as economical as others already available. As a result of this investigation the nature of the butadiene production process has been explained for the first time and a new reaction discovered which may well be of value in other chemical manufacturing processes.

ORGANIC SULFUR COMPOUNDS

The isolation of an antibacterial agent from *Allium sativum* was announced in 1944. This compound, allyl 2-propene-1-thiol-sulfinate, is not present in the garlic cloves, but is formed when they are treated by any procedure which breaks down the plant cells so that an enzyme is allowed to act upon another material of unknown nature present in the plant tissue. A method has now been devised by Cavallito and co-workers (Sterling-Winthrop Research Institute) for the synthesis of the natural compound and a number of analogs. The functional group present in these substances is a new one. All of the compounds prepared have considerable antibacterial and antifungal action and therefore may have practical value in the pharmaceutical industry.

Only comparatively recently has thiophene been made available as an organic chemical, produced from the high temperature reaction of sulfur with butane. It has now been found that a similar reaction of sulfur with styrene yields benzothiophene (Moore and Greensfelder, Shell Development Co.). Since this is an analog of naphthalene, an important coal tar product, a variety of uses for it may be expected to develop.

An unusual sulfur compound has been isolated by Zechmeister and Sease (California Institute of Technology) from the yellow petals of the African variety of the common marigold. This is terthienyl, a compound having three thiophene nuclei linked together in a chain. It was discovered because of its blue fluorescence which is unusual among pigments of vegetable tissues.

STEROIDS

An important event in steroid chemistry was the publication in September of the comprehensive paper by Marker, Wagner et al. (Penn. State College) on Steroid Sapogenins. This was one of the longest papers ever to appear in the *Journal of the American Chemical Society*. It deals with the results of a comprehensive search for naturally occurring sapogenins which contain an oxygen atom attached to the 11-position of the steroid nucleus. These were desired as starting materials for the synthesis of cortical hormones. Earlier, Marker and coworkers had been successful in finding sapogenins which can be used in the synthesis of sex hormones, and they hoped to repeat this success in the cortical hormone field. However, in an examination of some 400 species of plants in which 40,000 kg. of plant material was handled, no 11-

oxygenated steroid was isolated. The investigation provided interesting results, nevertheless, since new sources of supply were located for diosgenin, useful in synthesis of certain sex hormones, and many other sapogenins. In addition, 12 entirely new sapogenins and two steroids which are of possible interest as sapogenin precursors were isolated. The opinion is expressed that the steroid nucleus results from the condensation of several sugar units, a point of view advocated earlier by others. All 22 sapogenins studied were shown to be interrelated through relatively simple chemical changes. Apparently certain interconversions between closely related compounds also occur in the plant, for a given plant at one season of the year may contain only one sapogenin whereas at a later date a mixture is present, and this in turn may give way to a single final product. The complexities of the changes involved were followed closely through the seasons for a number of plant species.

There also appeared a series of 12 papers (Marker and Lopez, Laboratory of Botanica-Mex., S.A.) on more recent sapogenin researches which further extended our knowledge of this group of compounds.

ALKALOIDS

The common alkaloids have presented organic chemists with some of their most difficult and fascinating problems. It was only a few years ago that even a minute amount of quinine was synthesized in the laboratory. Morphine and strychnine are even more refractory in that their structures are not even yet completely settled, and synthesis of either of them is some distance in the future. During the year, Woodward and coworkers (Harvard University) presented additional data and arguments which assist in clarifying the structure of strychnine and confirm the formula proposed some years ago by Robinson of England.

Opium is a storehouse of alkaloids. Even yet the minor members of the group are receiving attention. There has now been reported a study on the isolation of neopine which is an isomer of codeine (Homeyer and Schilling, Mallinckrodt). From this, it was possible to make an isomer of morphine, which, however, does not have as high an activity as morphine as an analgesic agent.

HETEROCYCLIC COMPOUNDS

During the war there was an astonishing amount of synthetic organic chemistry devoted to the preparation of chemical compounds to be tested as anti-malarial agents. The majority of this work was concerned with heterocyclic compounds, *i.e.* those having other atoms as well as carbon in their rings. This work, carried out in many laboratories, has greatly increased the interest of many American organic chemists in a variety of heterocyclic types. Not only are the results of the work on the synthesis of compounds prepared for anti-malarial studies still appearing, but a considerable amount of fundamental organic chemistry research is being undertaken in the heterocyclic field as evidenced by the appearance of papers from many laboratories. A recent note by Koepfli, Mead, and Brockman (California Institute of Technology) describes the isolation of two alkaloids from the Chinese plant *Dichroa febrifuga* Lour. One of these compounds, which has the composition $C_{16}H_{19}O_3N_3$, is about 100 times as active as quinine in curing *P. lophurae* infections in ducks, and hence is worth further study as an anti-malarial agent. The structure of the compound is not known, but two of the nitrogens appear to be in a quinazoline ring. The second alkaloid is almost inactive as an anti-malarial agent, but it can be converted into the active compound by heat. There is some evidence that still another antimalarial drug is present in the leaves of the plant, and attempts to isolate this will be made.

Although a number of quinazoline derivatives have been synthesized in the laboratory, none has so far showed sufficient activity to be promising. Hence, elucidation of the structure of the alkaloids will be awaited with interest.

PODOPHYLLIN COMPONENTS

Investigators in two laboratories have reported that the drug podophyllin, a resinous mixture obtained from May apple roots and rhizomes, causes severe damage to tumor cells in mice. As a consequence, an intensive study of the resin is under way to isolate in a pure state all active components. One of these, podophyllotoxin, has long been known; another active compound, which has been assigned the name α-peltatin, has now been isolated (Hartwell, National Cancer Institute). Studies on the structure and biological properties are under way. The results of further work with podophyllin will be awaited with considerable interest as this seems to be more promising than most other present leads in the experimental cancer field.

FATTY ACIDS OF HUMAN HAIR

The fungus infection commonly known as ringworm of the scalp is common among children, but adults are largely immune. This immunity is associated with the change in chemical composition of the secretion of the glands of the scalp at puberty (Rothman, Smiljanic and Shapiro, University of Chicago and Standard Oil Co. of Indiana). A careful investigation of the free fatty acid fraction obtained from human hair has shown that the acids include those having an odd number of carbon atoms as well as the normal even carbon atom compounds. The acids which show an inhibiting action toward the growth of *Microsporon audouini,* the causative agent of the disease, are those containing 7, 9, 11 and 13 carbon atoms. Unsaturated as well as saturated acids are present. This seems to be the first instance where acids having an odd number of carbon atoms have been isolated from a natural source.

ANTIHISTAMINE AGENTS

Among the most useful types of synthetic medicinals developed in recent years are those which are reported to ameliorate the symptoms of allergies. New compounds, which in the laboratory have high potency in blocking the effect of histamine, have been found in the thiophene analogs of a drug already available (Pyrabenzamine). One of these new compounds was reported from three different laboratories during the year and presumably will be commercially available soon. Thiophene derivatives promise to be of considerable interest in medicine since they show activity at least comparable to the corresponding benzene derivatives.

PROTEINS

It has been found by Woodward and Schramm (Harvard University) that it is possible to polymerize amino acids into protein-like molecules of high molecular weight. The starting material for such a reaction is the anhydride of an N-carboxy-α-amino acid. A trace of water initiates the reaction which then proceeds spontaneously. The molecular weight of such a product from leucine for example is believed to be in the range of 1,000,000 to 15,000,000. These polymers differ greatly from proteins in that they contain only one amino acid, whereas the natural compound may be composed of as many as 20. Perhaps it will be possible to bring about polymer formation in a mixture of several amino acid derivatives, but it seems improbable that a natural protein can be prepared by Woodward's procedure. On the other hand, it is not unlikely that this work will lead to the preparation of polymers having useful properties in the resin field. It has been reported that the infrared spectrum of Woodward's compounds closely resemble that of denatured keratin.

VITAMINS

An improved method for the synthesis of riboflavin (vitamin B_2) has been described by Tishler and coworkers (Merck and Company). A general reaction is employed in which an *ortho* aminoazo compound condenses with barbituric acid. Barbituric acid is more readily available than the alloxan or the halogenated barbituric acid required by older synthetic methods.

Although three members of the vitamin E or tocopherol group of vitamins have been isolated and synthesized, still another member of this group, δ-tocopherol, has now been discovered by Stern, Robeson, Weisler, and Baxter (Distillation Products, Inc.). About 30 per cent of the vitamin E fraction of soybean oil is δ-tocopherol; lesser amounts occur in wheat germ oil, cottonseed, and peanut oils. The new compound is more effective as an antioxidant in protecting vitamin A against air oxidation than are the other tocopherols and also is itself more slowly destroyed by warming in contact with air. The chemical structure of the new vitamin was determined by degradation reactions and verified by synthesis.

Full details are now available concerning the isolation of neovitamin A from shark liver oil. This new vitamin constitutes up to 35 per cent of the vitamin A fraction of a number of fish liver oils, hence its isolation and a determination of its biological potency are of importance. It has been found by Baxter and Robeson (Distillation Products, Inc.) to be substantially as active as vitamin A by the standard U.S.P. growth test method.

ELECTROCHEMISTRY

By Colin G. Fink
Professor, Columbia University

GENERAL

No period in the history of electrochemistry since the fundamental discoveries of Michael Faraday (1833) has been so fruitful of far-reaching inventions as the period of the Second World War. At no time have so many new electrochemical products and processes been developed and introduced into industry: new cells, new vacuum tubes, new metals, new batteries, etc. At no time has interest in electrochemistry been so keen and so universal. In these post-war years we are beginning to realize that the great "boost" that electrochemistry received during the war will continue to exert itself for many years to come.

POWER

The general expansion of the electrochemical industry is more than ever contending with low electric power rates. The U. S. irrigation projects have very largely contributed towards the spread of the electrochemical industry. Abroad there are few electrochemical centers favored with low rates. German brown coal is a highly competitive raw material. The promotion of low rate hydropower is essential in establishing new electrochemical centers such as those of France, Italy, Scandinavia, and Russia.

ELECTRIC STEEL

The war stimulated outstanding improvements in the composition and physical properties of electric steel. A means toward this end is the general adoption of the "boil" in electric steel production. This boil is so called because the molten steel behaves very much like a boiling liquid. The electric furnace is charged with steel scrap or with molten steel from the open hearth furnace, together with certain additions such as scale (Fe_2O_3), pig iron, manganese, *et al.* As the temperature of the metal in the furnace is increased well above the melting point one or more of the following reactions takes place: FeO +

$C = Fe + CO$; $MnO + C = Mn + CO$; $SiO + C = Si + CO$; etc. The CO formed in the body of the molten mass rises to the surface of the bath bringing about the "boiling" effect. The resulting steels are superior to the older electric steels manufactured without the boil. It is the very fluid condition of the new steel while in the furnace, together with the thorough mixing effect, that gives the remarkable results.

PRIMARY CELLS

The National Carbon Company has marketed a new heavy-duty air cell suitable for railway signal service. The cell comprises a zinc metal anode, caustic soda electrolyte, and an anode of carbon of the gas mask type. Basically, air is the depolarizer. The new cell has twice the operating voltage and therefore twice the watt hour capacity of the Lalande (Zinc-Copper) cell. The new Ruben Cell comprises the electrochemical system: $Zn \mid Zn(OH)_2 \mid KOH$ aq. $HgO \cdot Hg$.

The rated capacity is 200 milliampere hours for each 1.6 gram unit of active material. The initial closed circuit voltage ranges between 1.24 to 1.31 volts depending on the load applied. Active materials are utilized to the extent of 85 per cent. The efficiency is decidedly above that of the old conventional Leclanché cell, the so called "dry battery."

A number of dry cells were developed during the war using magnesium in place of zinc. It is strikingly evident that the war gave the dry cell manufacturers the greatest "boost" to research since the inception of the industry.

THE NEW CASTNER CELLS

Under the stimulus of German findings, American alkali-chlorine producers have continued their researches on the mercury (Castner) process. It is found that the mercury process is more economical for small plants or for such plants manufacturing rayon-grade caustic, particularly at locations where solid salt is available or electric power is cheaper than fuel power. The mercury process is also favored for producing potassium hydroxide.

ELECTROLYTIC POLISHING OF METALS

Stainless steel, nickel, copper, brass, and others are now being commercially polished anodically largely with the aid of phosphate electrolytes. The surface produced is highly resistant to corrosion, aside from its very attractive appearance. An important factor in favor of electrolytic polishing is the relatively low labor cost.

CORROSION

Corrosion continues to be one of the most active fields of electrochemistry. Scores of chemists and engineers have joined the ranks of the corrosion engineers, and, in view of the high prices for metals, any distinct progress made in combating corrosion is welcomed by industry. The Dow Chemical Company continued to promote the application of magnesium as a sacrificial metal in the cathodic protection of pipe lines.

For the surface protection of magnesium articles and parts, non-porous coatings of anhydrous magnesium carbonate are produced by anodic treatment of magnesium articles in a saturated solution of sodium carbonate at 60°C and at an initial current density of above 50 amp/sq. ft. During treatment, the current density drops to 0.2 amp. per square foot under properly controlled conditions.

R. W. Buzzard has patented a protective coating for magnesium produced by making the magnesium article anode at 6 amperes per square foot in an electrolyte kept at 50°C and at a pH of 3. to 6.5. A typical bath contains 10 per cent sodium bichromate, 2 per cent of sodium biphosphate, and magnesium fluoride up to saturation.

J. Michel deposits anodically a coating of magnesium fluoride on magnesium metal and magnesium alloys using a saturated aqueous solution of ammonium fluoride (NH_4F). In place of the MgF_2 coating, P. R.

Cutter recommends a silicate coating produced anodically in an alkaline solution of sodium silicate.

ELECTRO-ORGANIC CHEMISTRY

The Electro-Organic Division of The Electrochemical Society devoted itself at the October Convention to the discussion of researches in "Electrolytic Oxidation and Reduction." This field has not attracted investigations to the same extent as the fields of electrodeposition and corrosion but the outlook for discoveries of widespread commercial application is most promising. It must be remembered that the United States became the leader in organic chemistry as late as 25 years ago. Previous to that time, Germany led the world in new dyes, new pharmaceuticals, and new organic products in general. Accordingly, electro-organic chemistry will soon benefit by the progress and development of the parent general subject of organic chemistry.

CONCLUSION

Reviewing the progress in electrochemistry during 1947, we can not fail to note the unprecedented number of reports and researches recorded in this most fertile field of chemistry. The year 1947 marks the first year that editors and publishers received more manuscripts than could be accommodated. The answer to this situation is the reported founding of new additional journals devoted to the science and application of electrochemistry, or, more specifically, devoted to one or the other field of electrochemistry such as corrosion, electro-plating, batteries, etc.

BIOLOGY

ORGANIC EVOLUTION AND GENETICS

By Warren P. Spencer
Professor, College of Wooster

PRINCETON CONFERENCE

The Princeton University Bicentennial Conference on Genetics, Paleontology, and Evolution was held at the Princeton Inn, Jan. 2-4, 1947. In attendance were about 65 of the leading authorities on evolution from the United States and the British Isles. The subjects presented and discussed at the conference sessions were: Time in Earth History; Gene and Character; Gene and Mutation; Time Series, Trends, in Animals; Time Series, Trends, in Plants; Rates of Evolution in Animals; Rates of Evolution in Plants; Speciation and Systematics; and Adaptation and Selection. Dr. J. B. S. Haldane addressed the conference and others at an evening lecture on "Man's Evolution, Past and Future." This Conference was an important milestone along the way toward a closer cooperation of geneticists, paleontologists, and taxonomists in studying the problems of evolution.

GENETICS OF MICROORGANISMS

W. S. Stone, O. Wyss, and F. Hass (30) began their study of mutation in the bacterium, Staphylococcus aureus, by dividing a 24-hour broth culture of this organism into two portions, one of which was exposed to heavy ultraviolet radiation for six minutes and the other kept as a control. The two cultures were then grown on nutrient agar and on nutrient agar plus several concentrations of penicillin. It was found that on control agar, the irradiated material, showed fewer colonies, had a poorer growth, than the control bacteria. However, on penicillin-agar the reverse was true, and where the penicillin concentration was highest the irradiated bacteria produced 1,660 colonies to 136 colonies of controls. Thus, they established that direct irradiation of the bacteria produced many mutants resistant to penicillin. The better growth of non-irradiated material on control agar proved that the results were not due to selection, but rather to mutation to resistant strains.

In the next step the nutrient broth was first irradiated for three hours, and then the bacteria were introduced. Again the bacteria grown on control agar without penicillin and without radiation showed higher colony formation than on control agar which had been irradiated. However, in the irradiated penicillin-broth colony formation was higher than in the non-irradiated penicillin-broth. With highest penicillin concentration, the non-irradiated broth produced 12 colonies, the irradiated broth 1,360 colonies. Subsequent irradiation of the mineral constituents and the amino-acid and vitamin constituents in separate experiments showed that the resistant mutations were produced only as a result of irradiation of the amino-acid vitamin fraction of the medium.

The authors suggest two alternative explanations: (a) that irradiation has produced new chemical compounds which in turn induced the mutations; (b) that there has been an absorption of energy which in turn induces mutation. They consider the second hypothesis to be the more tenable. Parallel experiments on streptomycin gave similar results. The mutations proved to be specifically resistant to penicillin or to streptomycin, but not to both. This important work has both theoretical and practical applications. On the one hand, it opens the way to a new attack on the problem of the nature of mutation; on the other hand, it suggests that atomic and other high energy radiation may induce mutation indirectly by action on the environment, particularly on the food taken into the organism.

Joshua Lederberg (20) cultured together two strains of the bacterium, Escherichia coli, each strain pure for at least two different mutants producing nutritional deficiencies. When grown on minimal media, wild-type or so-called "prototroph" forms appeared, which contained none of the four or more mutants carried by the original strains. These "prototroph" strains were considered to be the result of the formation of diploid zygotes through the sexual union of two bacteria with subsequent segregation of the non-mutant genes through random assortment or crossing-over. By the use of still other strains, containing the deficiency mutants plus such genetic factors as resistance and susceptibility to bacteriophage, he was able to demonstrate crossing-over between the new factors and the deficiency genes.

The proportions in which different segregants were recovered indicated that the genes were carried on one chromosome and in linear order. A tentative chromosome map containing eight gene loci was constructed. The fact that all factors thus far tested behaved as though linked has led to the conclusion that the genes in this species of bacterium are carried on one chromosome. The hypothesis that genes from one line had produced transforming substances, which induced directed mutations in the other line was found to be highly untenable on the experimental evidence. This investigation appears to have demonstrated that in this bacterium a sexual stage exists. The infrequency of formation of zygotes under present culture conditions makes it highly improbable that the zygote stage will actually be seen under the microscope. However, new methods of culture may well increase the frequency of zygote formation.

M. B. Houlahan and H. K. Mitchell (13) discovered a strain of the mold, Neurospora crassa, containing a pyrimidine-deficient mutant, which began to grow in the absence of pyrimidine. Results of the breeding tests showed that the strain carried a newly arisen mutant, which suppressed the action of the pyrimidine-deficient mutant. Four other pyrimidine-deficient mutants were tested and the suppressor acted on two of them but had no effect on the others. The three mutants affected by the suppressor had behaved in cross-tests as though they were alleles, mutants at one locus. However, there are technical difficulties involved in establishing allelism in Neurospora, and the identical action of the suppressor on all three was considered additional evidence that they were actually mutations at the same locus.

In a sulfanilamide-resistant strain of the mold, Neurospora crassa, S. Emerson (10) found a new mutant type, which required a sulfonamide for growth. The growth of this new strain was inhibited by very low concentrations of p-aminobenzoic acid. When subjected to high temperature and low sulfonamide concentration reversions occurred, which did not require sulfonamide for growth. Crosses of such reverted strains resulted in recovery of the sulfonamide-requiring type. This result indicated that suppressors had arisen at other loci, rather than reversion at the sulfonamide-requiring locus.

C. C. Lindegren and G. Lindegren (21) found that a mutation in the yeast, Saccharomyces cerevisiae, produced pink colonies. While the pink colonies were primarily conditioned by the mutant gene it was discovered that continuous culture resulted in the pink character disappearing, as though a reverse mutation had occurred at the pink locus. However, by out-crossing the white type thus derived from pink to an unrelated strain the pink character could immediately be restored. It was postulated that pink was conditioned by a primary gene plus other substances (X, Y, Z, etc.). These other substances were essentially genic materials which could be depleted, the gene itself being the substance X, Y, or Z. Outcrossing to a strain which had not been subjected to this depletion reaction immediately restored the combination of the primary gene and the secondary substance or gene required to produce the pink character.

MUTATION RATES

J. V. Neel and W. N. Valentine (24) reported their studies on thalassemia in the Italian population of Rochester, N. Y. Thalassemia major is an inherited blood disease, highly fatal. Thalassemia minor is a mild blood condition, apparently the heterozygous form of T. major. As T. major has a negative selective value of about one, and T. minor a negative selective value of between 0.1 and 0.0, they have estimated that the mutation rate, to account for the incidence of this gene, would have to be one in 2,500 or higher. This is the highest mutation rate yet reported for any human gene. Possible hypotheses alternative to that of high mutation rate were considered, though none of these seemed plausible. This work, in connection with former rates published by Penrose and Haldane, indicates that certain specific human genes have very high mutation rates in comparison with what is known of mutation rate in other organisms. Strangely enough, thalassemia is largely restricted to peoples of southern Mediterranean extraction.

L. C. Strong (31) injected mice from long inbred lines with the carcinogenic agent, methylcholanthrene. In addition to the occurrence of numerous malignant tumors, germinal mutations involving coat colors have apparently arisen in relatively high numbers. The experiment was carried out on a very large scale with adequate controls. While the actual mutation rate, as deduced from certain statements in the report, may not have been as high as estimated by the author, it would seem that this chemical agent had induced germinal mutations. This work extends the findings of Auerbach that chemicals, mustard gas compounds, could produce mutations in Drosophila, to the discovery of chemical induction of mutations in mammals.

R. Lamy (18) studied the origin of spontaneous lethal mutations in about 16,500 X-chromosomes of sperm derived from 79 Drosophila melanogaster males. By testing the sperm from each individual male separately, and by allowing some of the males to breed slowly and others rapidly, she concluded that sperm produced in the first week showed a higher mutation rate than those produced later; that in slow breeding after a low incidence of mutation in the second week there was a later rise in mutation rate, but not to the level attained in the first week. In general, her findings were in agreement with the more extensive data of Dr. H. J. Muller, published previously.

B. P. Kaufmann (14) reported lethal mutation rates in the X-chromosomes of sperm from D. melanogaster males 1-2, 16-17, and 32-33 days old. The aged males were not allowed to copulate until the time when the sample of sperm was taken. He showed that the number of mutations in the aged sperm was markedly increased. This finding may be harmonized with those of Muller and Lamy, as the unmated males probably do not continue to form fresh sperm. Apparently mutations were occurring during the time that the sperm were aging.

HYBRIDIZATION AND SPECIATION

The fifth in the series of monographs on "Studies in the Genetics of Drosophila," written by J. T. Patterson and his colleagues (25) and published by the University of Texas Press, appeared in 1947. The monograph deals with "Isolating Mechanisms," and for lack of space only a few of the findings can be mentioned here. Patterson reported more fully on the "insemination reaction" in intra- and inter-specific crosses. During or, soon after copulation, there is a rapid secretion of fluid into the vagina, causing a swelling to three or four times normal size. In intraspecific matings, the swelling subsides in a few hours, but in certain interspecific matings may persist for several days. In all, eight members of the D. mulleri species group tested, the insemination reaction occurred in intra-specific matings. In those crosses between species where sperm were deposited, the insemination reaction occurred in an exaggerated form and often resulted in degeneration of the eggs before they were laid. This factor was interpreted as a potent isolating mechanism, preventing successful species crosses, though only one of several such mechanisms which have been discovered.

M. R. Wheeler (25) studied the intra-specific insemination reaction in 78 species of Drosophila. He found that about one-fourth of the species did not show it; in one-fourth it appeared in moderate form; and in one-half the reaction was extreme. W. K. Baker (25) demonstrated that certain strains of the species, Drosophila arizonensis, were partially sexually isolated from one another. The high F_1 hybrid fertility indicated that the isolating factors were autosomal recessives. In inter-specific crosses between D. arizonensis and D. mojavensis sexual isolation was much less potent than reproductive isolation, *i. e.* hybrid sterility. J. W. Sears (25) made inter-specific crosses in the D. quinaria species group. Of the nine species used in all possible cross-matings, every one was found to cross with at least one other in the species group. Fifteen of these crosses were partially fertile. Twenty-seven of the 60 possible back-cross combinations of the hybrids to parent species were partially fertile. Eight of the 15 hybrid combinations were partially fertile when inbred. Phenotypic differences between species in some cases showed dominance of one species character over the other and in other cases intermediate or blending expression. These cases and others reported in the monograph served to illustrate the wide variety of isolating mechanisms in the genus Drosophila, and the many different levels of divergence attained in the process of speciation in different populations, subspecies, and species pairs and groups. The work of this team of investigators has added much to the knowledge of evolution in this genus.

J. C. King (15) studied the cytology of six closely related species of Drosophila, five from Brazil and one from Mexico. They were divided into two subgroups on the basis of morphology and cytology. The three species in one subgroup showed interesting similarities and differences. Morphologically, D. guarani appeared to be intermediate to the other species. However, guarani could not be crossed successfully either to D. guaru or D. subadia, although hybrids of the latter two species were produced. Such hybrids could then be crossed successfully to guarani and triple hybrids produced, bearing some chromosomes from each of the three species. The chromosomes of the triple hybrids showed as good paring as in many hybrids between two species. It was concluded on the basis of the study that the chromosomes of all three species were very similar, and that, in the main, differences in metaphase chromosome configurations were due to varying amounts of heterochromation in the three species.

H. V. Crouse (7) studied the chromosomes in the salivary glands of two species of the fungus gnat, Sciara. She found a long terminal inversion in one chromosome in a specimen of

S. ocellaris. The study of the chromosome pairing in hybrids between S. reynoldsi and S. ocellaris has led her to conclude that, in the course of speciation, inversions, some of which were terminal, have brought about a difference in gene alignment in the two species.

Continuing his work on the hybridization of geographic strains of the frog, Rana pipiens, J. A. Moore (23) crossed frogs of this species from Mexico with those from Vermont. The hybrid abnormalities were the most extreme yet seen, correlated with the fact that these frogs came from more widely separated latitudes than in any previous experiments. These geographical extremes of Rana pipiens behaved in hybridization as though they belonged to two distinct species; yet it had been shown that all along the north-south transect investigated populations from adjacent regions were interfertile.

J. Clausen, D. D. Keck, and W. M. Hiesey (6) reported on extensive experiments in plant hybridization, which they have been carrying on for some years at three California stations, one near sea-level at Stanford, a second at Mather in the Sierras at about 4,500 feet elevation, and a third in the High Sierras at over 10,000 feet elevation. It is not possible here to relate even in brief summary the several experiments. They have crossed ecotypes, ecological races, of different plants from these elevations, and then selected certain F_2 segregants for further study. Clones, groups of plants with the same heredity secured by vegetative propagation, have been established. Representatives of these clones were grown at the three stations and their adaptive potential for the three ecological habitats determined. This comprehensive study, covering years of work and thousands of plants on which measurements have been taken annually, has demonstrated that many genetic combinations, some of them more favorable for particular habitats than the plants from which they came, can be produced naturally or artificially by hybridization and subsequent selection.

C. Epling (11) examined populations of two species of Salvia growing in the coastal regions of southern and central California. These two species showed a sympatric geographical distribution, although S. apiana tended to a drier habitat, invading the chaparral zone, while S. mellifera was more coastal. Hybrids were frequently found growing in colonies of S. mellifera, and careful examination of such colonies gave evidence of backcrossing to S. mellifera. The distribution of hybrids indicated that generally S. mellifera was the female parent. Local disturbances of the habitat, either natural or man-made, seemed to favor hybridization. In spite of the frequency of crossing both species maintained their identity throughout the range. This fact was accounted for by low fertility of the hybrids, and somewhat different ecological adaptations and seasonal rhythms of the parent species.

W. J. C. Lawrence (19) found two genes, L and E, in a species of Streptocarpus from South Africa, which when present in the same plant produced a sublethal condition, the genes acting as complementary dominants. The population carrying the L gene was 230 miles from that carrying the E gene. Had these genes become fixed in the two geographically isolated populations either by selection or genetic drift, they would have constituted an effective bar to intercrossing, should the populations ever become contiguous. Such physiologically isolated populations might then undergo subsequent changes leading to speciation.

J. W. MacArthur and L. P. Chiasson (22) made crosses between tomato species belonging to different subgenera and demonstrated that the evolutionary divergence was mainly in gene differences. They showed that hybrid infertility was not due to chromosome incompatibility.

S. J. Wellensiek (32) reported on methods for producing Triticales, the amphidiploids of wheat-rye hybrids. By crossing Triticum vulgare, a wheat with 42 chromosomes, to Secale cereale, rye with 14 chromosomes, he produced F_1 hybrids with 28 chromosomes. These were then divided repeatedly to form clones of several hundred plants. These plants were treated by immersing the roots repeatedly in a .05 per cent aqueous solution of colchicine and replanting. The colchicine treatment resulted in the formation of some amphidiploids with 56 chromosomes, which were quite fertile.

CYTOGENETICS

J. P. Kotval and L. H. Gray (17) used alpha-particles, known to produce very high ionization, in irradiating the microspores of Tradescantia. The number of chromosome aberrations thus produced indicated that alpha-particles passing near, as well as those passing through, a chromatid might induce breaks. The relatively high number of iso-chromatid breaks, simultaneous breaks at the same level in two sister chromatids, also favored this interpretation. It is suggested that alpha-particles in nature may have played a considerable role in the production of chromosome abnormalities. This work was part of the extensive cytogenetic radiation program initiated some years ago by D. E. Lea and D. G. Catcheside.

L. Smith (29) produced a strain of wheat containing a chromosome fragmented through the centromere. The two fragments, each with a spindle attachment, were found useful in determining the linkage group of certain genes. H. Roman (27) produced interchanges between the regular or A chromosomes of corn and a supernumerary or B type chromosome, which has no specific genetic effect in itself. These "translocation tools" could then be used in attacking numerous problems dealing with the cytology and genetics of corn.

D. G. Catcheside (5) demonstrated that in the plant, Oenothera, three adjacent genes when transferred to a new location by a segmental interchange, produce a variegated spotting character. This was shown to be a position effect by the transfer of these genes back to their normal position in the chromatin complex, resulting in the disappearance of the variegated character. This is the first well established case of "position effect" in plants. Karl Sax (28) showed in Tradescantia that certain chromosome aberrations were increased in frequency if the material was subjected to low temperature at the time of X-ray treatment.

A. A. Prokofyeva-Belgoskaya (26) made a thorough study of the nature of heterochromatization. Heterochromatin, in contrast to euchromatin, contains more thymonucleic acid, the chromonemata are twisted into a tight spiral, and during the major part of the cell cycle it stains deeply as does all chromatin at the metaphase stage of mitosis. There is also a tendency for the chromatids to repel one another. Thus in salivary gland chromosomes the heterochromatic regions show a repulsion of the numerous chromatids, leading to a diffuse, meshlike structure in contrast to the closely apposed chromatids of the euchromatic regions. When euchromatic material is transported by translocation to a point adjacent to heterochromatin it too takes on these properties, thus accounting for the position effect of genes in this transposed euchromatin. Such genes tend to become inert and to produce the mottling effects often noted.

By a parallel study of effects of temperature, sex, age of parents and other factors on heterochromatization and on crossing-over the author concludes that heterochromatization is essentially a change in the chromosome cycle, in which the chromatin spends relatively more time in the mitotic or division stages and less time in the metabolic or resting stage. On this interpretation even euchromatin goes through a heterochromatic time period, albeit much shorter than that of heterochromatin. Whether this comprehensive hypothesis of heterochromatization be accepted in its entirety remains for future study. In any case it points the way to further work in the resolution of many obscure phenomena connected with the differential action of the several chromatic regions.

H. G. Callan and G. Montalenti (3) demonstrated that there is chiasma interference across the centromere in the mosquito, Culex pipiens. This work corroborates that of Patau on this species and one other. The situation in this mosquito differs from that in Drosophila, where interference across the centromere is absent.

C. Auerbach (1) treated Drosophila melanogaster with mustard gas, and among other mutations produced by the treatment found one which had a weakening effect on the centromere, the point of attachment of the spindle fiber. This mutation resulted in abnormal behavior of the X-chromosome in gamete formation. M. Kodani (16) demonstrated that there is an apparent difference in terminal bands in the salivary X-chromosome of different stocks of Drosophila melanogaster. He interpreted these differences as due to different degrees of packing of the terminal chromatin and not to deficiencies.

NATURAL SELECTION AND POPULATION GENETICS

On the basis of an extensive study of the English sparrow in the United States, J. B. Calhoun (2) concluded that there has been an increase in the mean size of this bird since its introduction in the period between 1850 and 1880. His analysis included 1,614 study skins and over 600 specimens collected at the time the work was done. The distribution in four north-south temperature zones studied indicated that larger size had been attained in northern zones than in southern, a probable adaptation to high temperatures in the south and low temperatures in the north.

In the stickleback fish, Gasterosteus aculeatus, M. J. Heuts (12) found two distinct physiological types, one adapted to marine and the other to fresh-water habitats. Populations of this fish differed in a complex of morphological characters; but there was intergrading of these characters with a distinct tendency to the formation of a north-south gradient. On the other hand the physiological types were distinct with little intergrading. Heuts concluded that, starting from a polygenic complex, adaptive evolution toward the two distinct types had occurred.

H. L. Carson and H. D. Stalker (4) collected specimens of Drosophila robusta in large numbers from five localities ranging in a northwest-southeast transect from Iowa to Florida. One large collection from Ohio, some 500 miles east of the transect, and small collections from many other points in the eastern United States were made. Analysis of the salivary chromosomes of the descendants of these flies revealed the presence of 13 inversions in the six chromosome arms in addition to the standard sequence. Most of the inversions were widespread over the geographical range, but showed north-south gradients in distribution. In some cases an inversion was very frequent at one end of the transect and entirely lacking in the sample from the other end. Of special theoretical interest was the finding of two pericentric inversions, rearrangements across the centromere, a condition found thus far in only one other Drosophila species.

N. P. Dubinin and G. G. Tiniakov (9) found a remarkable distribution of inversions in the chromosomes of Drosophila funebris. The summer populations of this species in the central part of Moscow contained about 90 per cent of flies heterozygous for chromosome inversion; those on the margin of the city contained about 12 per cent inversion heterozygotes; in the suburban villages the incidence had fallen to 2 per cent. They reported similar distributions in other cities. Apparently the inversion heterozygotes were adapted to urban or industrial habitats, and flies free from these chromosome configurations were better adapted to rural conditions. In another paper, they reported that hibernating flies showed a marked drop in the incidence of inversion heterozygotes through a two and one-half months period.

Th. Dobzhansky and S. Wright (8) studied the diffusion of a mutation through a population of fruit-flies. Over 25,000 orange eyed Drosophila pseudo-obscura were released at one point in the Sierra Nevada mountains in July and August. Ten months later, by trapping and testing for flies carrying the orange gene they showed that 95 per cent of the progeny of the released flies were living within a radius of about 1.1 miles.

Watkin Williams (33) reported further results of studies on the oppositional alleles in red clover. In this remarkable multiple allelic series fertility results only if the pollen tube contains an allele different from at least one of those carried by the female parent. However, a few pollen tubes may grow and fertilize eggs even when both parent plants are homozygous for the same allele. Such a phenomenon is termed "pseudo-fertility." By this means several homozygous plants were produced and tests of self-sterility and of backcross sterility demonstrated their genetic constitution. One self-fertility allele in the series was discovered. In a large scale test 37 out of a total of 40 genes picked at random from a red clover population were shown to be different. This experiment demonstrated the complexity of the mechanism which has developed in this plant to secure cross-pollination through self-sterility.

NEW BOOKS AND JOURNALS

The first volume of a series on *Advances in Genetics* (458 pages) was published by the Academic Press. It contained review articles on: Cytogenetics and Breeding of Forage Crops; Cytogenetics and Speciation in Crepis; Speciation in Fishes; Immunogenetics; the Origin and Evolution of Maize; the Genetics of Cattle; Recent Advances in the Genetics of Paramecium and Euplotes; Mutations in Wild Populations in Drosophila; Types of Polyploids; their Classification and Significance; and Cytogenetics of Gossypium and the Problem of the Origin of New World Cottons. This volume was edited by Dr. M. Demerec and the contributors were specialists in the several fields covered.

Dr. D. E. Lea wrote a notable and timely book on *The Action of Radiation on Living Cells;* notable in that he, as a physicist, has for some years collaborated with cytogeneticists and has a thorough understanding of the underlying problems; timely in that we are now in the new atomic age, where radiation will play an increasing and not always beneficent role in human, animal, and plant biology.

Two new journals have been founded in the past year: *Evolution,* published in the United States and edited by Dr. Ernst Mayr, and *Heredity,* published in Great Britain and edited by Dr. C. D. Darlington and Prof. R. A. Fisher.

ENTOMOLOGY

By Roger B. Friend
Connecticut Agricultural Experiment Station

INSECTICIDES

In no field of endeavor during the past year has there been greater activity than in the development of insecticides. Not only have new chemical compounds been made available, but the problems of formulations have been attacked with some success, new apparatus has been developed for applying these insecticides, and field tests have been made with them against the pests of a number of crops, domesticated animals, and man.

As far as chemical structure is concerned, probably the greatest activity has been with chlorinated hydrocarbons and organic phosphates. Among the chlorinated hydrocarbons, particular emphasis has been given to benzene hexachloride, Chlordane, a chlorinated camphene known as Toxaphene, and such materials as Methoxychlor and DDD, analogues of DDT. Progress has also been made, of course, in the utilization of DDT itself. As for organic phosphates, particular attention has been given to a material known as Parathion (o,o-diethyl o-p-nitrophenyl thiophosphate). This compound was first utilized in Germany for insect control and high insecticidal efficiency has been indicated on a number of pests. It is highly toxic to warm-blooded animals when taken orally, and in organic solvents it can be highly toxic when applied to the skin. Vapors are also toxic when inhaled. The compound acts on the parasympathetic nervous system. Another organic phosphate, hexaethyl tetraphosphate, has been widely investigated. This material was also developed by the Germans during the war, and the common name Bladan given to it. Hexaethyl tetraphosphate does not exist as such but is a fortuitous mixture of organic phosphates, the active agent being tetraethyl phosphate (Hansen, *Jour. Econ. Ent.,* 40:600). Synergists for rotenone and pyrethrum compounds have also been investigated, and piperonyl compounds have shown promise.

Frear and Seiferle (*Jour. Econ. Ent.,* 40, p. 736) have published an interesting paper on chemical structure and insecticidal efficiency. They summarize the published and unpublished results of tests of 6,155 chemical compounds. The chemical groupings present in these compounds have been studied in relation to these results. Certain of these groups are regularly associated with low toxicity. The findings are presented as a guide for workers who are interested in the synthesis of compounds of insecticidal value.

The use of airplanes to apply insecticides is expanding rapidly. Among recent developments is the use of airplanes to control grasshoppers in the western states. In the ten-year period 1936-45 grasshoppers destroyed $400,000,000 worth of crops. During this same period control measures saved crops worth $600,000,000 at a cost of less than $25,000,000. Brown (*Jour. Econ. Ent.,* 40, p. 607) carried out a series of tests designed to determine the efficacy of an oil-base bran-sawdust bait containing commercial Chlordane for grasshopper (*Melanoplus mexicanus*) control when dispersed from a light airplane. He obtained a population reduction in six days of approximately 95 per cent. Brown (*Jour. Econ. Ent.,* 40, p. 606) also tested an emulsion of 3,5-dinitro-orthocresol for the control of *Camnula pellucida* by aircraft and obtained a population reduction of approximately 75 per cent.

Probably the largest forest-insect control project of its kind ever undertaken was carried out in the summer of 1947 in an attempt to control a severe outbreak of the Douglas fir tussock moth in the western part of the United States. Between May 22 and July 2, 390,881 gallons of DDT solution were sprayed by airplanes over 413,469 acres nearly all of which was in mountainous country. A few days after spraying, it was almost impossible to find living caterpillars in the area. Although a polyhedral virus disease killed mature caterpillars almost completely in the area infected and not sprayed, nevertheless had not the spray been applied in the areas involved severe defoliation would have ensued and many trees would have died.

Hawes and Eisenberg (U.S.D.A. *Bibliographical Bul. No. 8*) have compiled a bibliography on aviation and economic entomology. The material is arranged in chronological sequence, starting in 1919 with an anonymous contribution entitled "Bee-farmer Uses Airplane" and ending with a contribution of Wisecup brothers and Eide in 1945, which paper is entitled "Airplane Spraying of Rice Fields with DDT to Kill Mosquito Larvae."

Some conception of the extent to which airplanes are used for insecticidal dispersion in this country can be obtained from the reports from a few states. There are said to be 75 firms or individuals licensed to perform pest control by air in California where 296,000 acres were treated in 1946, and 500 custom rigs in Iowa and in southern Indiana, one to five rigs per county, which contract for anything from spraying an orchard to chemical weed control in corn.

The practical utility of chemical agents in controlling insect pests is indicated by the results of tests reported during the year. It is not possible to review more than a relatively small number of typical cases.

Those pests that affect corn are of paramount importance when we consider the amount of damage insects may do to this plant. For example, in 1946 the European corn borer cost American farmers at least $37,000,000. Eighty-four per cent of this damage occurred in Iowa, Illinois, Indiana, and Pennsylvania. This insect is one of the number of insect pests which destroy the crop or reduce the yield. (See "Insect Pests and Plant Quarantines.")

FOREST AND SHADE TREE PESTS

One of the most difficult tree pest problems in the country at the present time is that of controlling the bark beetle that transmits the Dutch elm disease. This disease is spread from the original source of infection, and in 1947 investigators at the University of Massachusetts stated that infected trees were found up to Jan. 1, 1948, in Massachusetts from Mt. Washington on the west to Raynham on the East. As far as the entomological aspects of the disease are concerned, it appears that there is a good chance that DDT sprays may be applied to elm trees and will protect them from bark beetle attack and hence inoculation. The exact dosage and the best method of application has not been determined, the matter still being in the experimental stage. However, the proper care of elm trees appears to reduce the risk of disease infection.

There is great promise that a solution to the gypsy moth control problem has been developed, as the application of small quantities of DDT by airplane gives excellent control and can be carried on efficiently and very cheaply. Some conception of the extent of these control operations and their success is contained in a report by Corliss (*Trees,* Nov.-Dec. 1947, p. 7). In 1944, 5,000 acres were sprayed, in 1946, 82,000 acres were treated, and in 1947, 163,000 acres, in all cases DDT being the insecticide employed. The treatment has been very effective and at the dosages now used no hazard to watersheds is involved. The earliest experiments employed DDT at five pounds per acre, which caused a minor mortality to birds, but further experience indicated that a dose of one pound of DDT would be adequate and in some cases even less would suffice. At one pound per acre no mortality or disturbance to birds was noticed. Insects other than the gypsy moth are killed, but the areas treated are rapidly populated with these other species and not with the gypsy moth. The damage to fish in brooks and ponds when DDT is used at one pound per acre is negligible. No burning of the foliage of forest trees has been noticed when the recommended rates of application are used.

Among forest insect pests are several species of sucking insects which cause peculiar injury to the tree. Anderson has investigated the injury caused by the Saratoga spittle bug to jack pine and red pine in northern Wisconsin. The adults feed on the needle-bearing portions of the branches, and the location of feeding is indicated by necrotic spots in the inner bark. The resin infiltrates into the conductive tissue and apparently interferes with water conduction. The ultimate result is the yellowing of needles and the death of branches. This injury under natural conditions is associated with heavy spittle bug attack, and prevention of insect feeding prevents the injury from taking place. A further report of Anderson's investigation is contained in the same journal. He finds that eggs of the spittle insect are laid in the needle sheaths of pines and in buds, several species of hardwoods also being utilized by the insect. Nymphs are found on a total of 36 species of herbaceous plants and low-growing woody plants, and adults feed chiefly on the needle-bearing twigs of pine. Any cultural practices in the plantation which reduces the number of nymphal host plants assist in depleting the population of this pest.

The allegheny mound building ant, *Formica exsectoides,* is a serious pest of white pine plantations in northeastern United States, being particularly abundant on sandy soils. The biology and control of this insect has been investigated by Elizabeth Haviland. This author obtained the best results with sodium fluoride, a barrier being placed around each mound. However, unpublished results of others indicate that Chlordane is probably the best chemical for the control of this species yet developed.

GREENHOUSE PESTS

Many of the newer insecticides developed within the last few years have been particularly valuable in controlling insect pests in the greenhouse, not only when the material was applied by the conventional methods of spraying or dusting, but also when aerosols were employed. Ludvik and Decker have investigated the toxicity of certain esters of phosphoric acids to aphids, particularly species of Myzus. Eight of the 46 compounds tested, all of them derivatives of phosphoric acid, and including hexaethyl tetraphosphate, were superior in toxicity to nicotine alkaloid. The most promising of these were tetraethyl pyrophosphate, tetrapropyl pyrophosphate, and tetrapropyl phenyl triphosphate. All of these may possess commercial possibilities. Pyrophosphates and triphosphates in general are extremely toxic to aphids.

Metcalf has reported on the relative toxicity of isomeric hexachlorocyclohexane and related materials to thrips. The gamma isomer was approximately 10 times as toxic by weight as p-p′ DDT, 25 times as toxic as Toxaphene, 50 times as toxic as hexaethyl tetraphosphate. The relative toxicities of the five hexachlorocyclohexane isomers to the greenhouse thrips were found to be gamma 1, alpha 1000, delta 10,000, beta and epsilon greater than 10,000. Certain other chlorinated compounds were found to be relatively non-toxic to thrips.

Smith, Fulton, and Brierley (*Agricultural Chemicals,* Vol. 2, No. 12, p. 28) have reported on the use of DDT and hexaethyl tetraphosphate applied as aerosols in control of certain pests of greenhouse plants. DDT settled on the plants and killed by contact or residual action. Five grams of DDT or 100 grams of aerosol solution per 1,000 sq. ft. of greenhouse space, equivalent to 10 pounds of solution per acre, appeared to be adequate. Hexaethyl tetraphosphate behaves in part as a fumigant. Hence the dosage is determined on the basis of the volume to be treated. One gram of this material, or 10 grams of aerosol solution per 1,000 cu. ft. of greenhouse space, was adequate. Hexaethyl tetraphosphate is soluble in methyl chloride, and this solvent, as well as Freon-12, was used in the tests, the formula containing approximately 10 per cent of hexaethyl tetraphosphate in anhydrous methyl chloride. The toxicant ingredients of the compound dissipated by the morning after an all-night exposure. To avoid plant injury, temperatures above 70° F. should be held.

According to a press release by the U. S. Department of Agriculture, aerosols containing hexaethyl tetraphosphate have given unprecedented control of the two-spotted spider mite on roses in greenhouses. The treatment increased the length of rose stems as much as 30 per cent and gave as much as a 30 per cent gain in bloom production.

PRODUCTS PESTS

Insect pests take a tremendous toll of grain from the farm storages through the warehouses and to finished products made from the grain. According to a recent report by the U. S. Department of Agriculture, insects living in farm grain bins, destroy 5 per cent or more of our nation's stored grains and cereal products every year and cause an annual loss estimated at 300,000,000 bushels of grain, worth over $600,000,000 at today's prices. This terrific loss is being carried principally by the farmers. In Mississippi alone, the loss to corn by the next summer may be total and is probably 25 per cent or more of the grain stored on the average. Unless the 1947 southern crop is fumigated, it stands a very poor chance of being of any value next spring. The problem of the proper treatment of grain is therefore acute at all times and anything which will add to the efficiency of the treatment is of great value.

According to Carpenter, preliminary tests indicate that a spray containing benzene hexachloride may possibly be used effectively on some of the more common stored insects in food processing plants and in warehouses. This material has both fumigating and contact effect. Srivastava and Wilson report that the residual effect from benzene hexachloride is considerable 24 hours after the chemical itself has been removed. In every case the addition of benzene hexachloride to another fumigant made it possible to reduce the amount of the fumigant required alone. In some instances the reduction was nearly 50 per cent. The contact effect is more effective than the fumigating effect because only when the material is well distributed through the grain is high control obtained in a short time.

PESTS AFFECTING DOMESTICATED ANIMALS AND MAN

Many of the recently developed insecticides have been found effective in the control of insects affecting man and domesticated animals. Benzene hexachloride has proved to be one of the most effective chemical agents now known for the control of certain animal parasites on cattle. A mixture of 3 to 5 per cent in pine oil squirted into a cow's ear has not only killed all the spinose ear ticks present, but has kept the ear clear of the ticks for at least 17 days. Furman reports that two species of cattle lice were eradicated by dipping in a 0.3 per cent suspension of benzene hexachloride. A third species of louse was completely eliminated by a single dip in .15 per cent benzene hexachloride. Complete kill of all motile stages, high ovicidal action, and failure of any emerging nymphs to survive on the treated animal were noted. Sweetman found that spray applications containing 0.2 per cent DDD and 0.2 per cent Chlordane were effective in controlling lice with no irritation or harmful effects on hogs. Chlordane acted the more rapidly of the two insecticides tried, causing the lice to begin to drop in a few minutes. According to Hixson and Muma, benzene hexachloride appears to be a very promising control for hog mange, caused by *Sarcoptes scabiei suis*. The low toxicity to the animals and the very good possibility of lice control make the chemical worthy of extensive testing. It is economical.

The control of flies in hog barns has always presented a difficult problem, but according to Munro, Post and Hoyman (*North Dakota Agricultural Bimonthly Bulletin*, Vol. 9, p. 109), a 50 per cent wettable powder of benzene hexachloride applied at 0.5 of 1 per cent concentration gave excellent control of the flies in those barns where the flies were abundant, but the objectionable musty odor detracted from its use in dairy barns or near food products. The hogs apparently suffered no ill effects, and no ill effects were observed on beef animals likewise thoroughly drenched. Dichlorodiphenyl-dichlorethane (DDD) was also quite effective in reducing the abundance of flies in beef cattle barns and sheep pens. Benzene hexachloride, according to Hixson and Muma, had a disagreeable and persistent odor and affected the flavor of eggs for a short period of time when used in poultry houses for the control of the chicken mite. Among the insecticides tried, azobenzene was the only one tested that acted as an ovicide. Pentachlorophenol also gave excellent results.

Fales, McGovran and Fulton state that a commercially prepared 100 per cent gamma-benzene hexachloride proved superior to DDT in killing both houseflies and mosquitoes and also superior to the standard cyclohexanone-lubricating oil-pyrethrins formula. Fay, Cole and Buckner have also studied the effects of various insecticides in controlling houseflies and malaria mosquitoes. These insecticides were compared as xylene or kerosene sprays on the basis of 100 and 200 mg. of the insecticide per square foot with the exception of pyrethrum combinations with piperonyl butoxide and piperonyl cyclohexanone which were tested at the manufacturer's recommendations. In order of their residual effectiveness over a 26-week period the insecticides were DDT, benzene hexachloride, Chlordane, Toxaphene, and DDD. The pyrethrin combinations had little residual effectiveness and di-2(ethyl hexyl) phthalate exhibited no residual effectiveness against *Musca domestica* or *Anopheles quadrimaculatus*. Cutkomp has published the results of certain experiments with residual sprays to control *Anopheles quadrimaculatus*. The type of surface was found important for residual insecticide application. After 29 weeks DDT was more effective than benzene hexachloride or Chlordane applied on a beaver wallboard. Benzene hexachloride produced more rapid toxic effects than DDT when residues were not so old. On a clay subsoil surface DDT formulations were not as effective as benzene hexachloride. The toxicity of Chlordane on clay was very low after one week. All three materials were much more effective on wallboard than on clay.

TOXICITY TO MAMMALS

Furman has reported that commercial benzene hexachloride of 12 per cent gamma isomer content has a relatively low autotoxicity when administered orally or to the skin of laboratory mice as a water suspension. There is no marked evidence that an accumulative action on mice occurs. No indication of toxic action to cattle was found when the material was administered orally in doses well above the range of probable ingestion in dipping procedures. No toxicity to cattle was apparent when dipped in suspensions of a concentration up to 0.5 per cent.

It has been reported by the U. S. Department of Agriculture that in the control of disease-carrying insects, it is possible in some cases to kill these pests by feeding certain chemicals to animals that will make the blood of the animals deadly to the blood sucking insect pests that prey on them. Body lice and yellow fever mosquitoes have been killed in this way. Of the compounds tested, benzene hexachloride was definitely poisonous to the rabbits used.

Twinn (*Scientific Agriculture,* 27:3, p. 97) has given a general discussion of insecticides, repellents and rodenticides of value in the field of public health. This discussion includes practically all of the more recently developed compounds of importance.

APICULTURE

The development of new insecticides for the control of insect pests has been of great concern to the beekeeping industry in the country because of the possible effects on the bee population. According to Eide, who tested a number of materials, using honeybees as an experimental animal, 2,4-D, piperonyl cyclohexanone, xanthone, Chlordane, and phenothiazine were non-toxic. Rotenone and dianisyl trichloroethane were toxic under certain conditions. Cryolite, calcium arsenate, dinitro compounds, DDT, sabadilla, hexaethyl tetraphosphate and benzene hexachloride were highly toxic.

The use of sulfa drugs to control American foul brood disease of honeybees continues to be investigated. Johnson has reported continued success, using sulfathiazole as a treatment. Eckert states that in certain cases the use of sulfathiazole or other sulfa drugs may be justified and advantageous. In other cases it may not be so. The disadvantages of such treatments are the masking of the foul brood disease of bees in areas particularly where the shipment of package bees is an important industry, as for example, in Mississippi, where the authorities have refused to permit the sulfa treatment to be carried out in many apiaries. Reinhardt states that sulfathiazole appears to have bacteriostatic or bactericidal action on the bacillus causing foul brood. There is a cessation of brood mortality in the presence of an adequate inoculum of the pathogen. A drug having such properties is all that is required to achieve a temporary cure because the bees normally remove dead brood. Permanent cure of American foul brood with drugs requires that infective material within the hive be removed or consumed while the drug is effective in preventing brood mortality.

TAXONOMY

During the year, a large number of taxonomic papers were published dealing with various families and orders of insects, and it is impossible to mention them all in this publication. A few of the more significant as related to their importance to economic entomology may be mentioned. Gurney (*Psyche,* 54, p. 145) published "Notes on Dilaridae and Berothidae, with Special Reference to the Immature Stages of the Nearctic Genera." These are predaceous terrestrial forms of Neuroptera. Ross (*Transactions of the American Entomological Society,* 73, p. 125) has given descriptions and records of North American Trichoptera, describing several new species and in some cases including keys to species. Sampson (*University of California Publications in Entomology,* 7, p. 365) has published a generic classification of California aphids by means of first instar nymphs. This is an important paper, as our descriptions of immature insects are all too few.

Walcott (*Fieldiana* 32, p. 61) has written a catalogue of North American beetles of the family Cleridae. These are predaceous, many of them preying upon pine bark beetles. Buchanan (*Proceedings of the Entomological Society of Washington* 49, p. 41) has published a key to the species of curculios attacking hickory in this country. Davis (*Proceedings of the United States National Museum* 96, p. 483) has reviewed the weevils of the tribe Ophryastini of America north of Mexico. Several new species are described. Dieke (*Smithsonian Miscellaneous Collections* 106) has published an important taxonomic paper on ladybeetles of the genus Epilachina, a genus which is phytophagous in habit and many species of which are of great economic importance.

Several papers of interest in taxonomy concern the order Hymenoptera. Banks has published a Synopsis of West Coast Cerceridae (*Psyche,* 54, p. 1). These digger wasps prey most commonly on beetles. Strandtmann has reviewed the North American species of Philanthus north of Mexico, a genus belonging to the family Sphecidae (Ohio State University Graduate School Studies). This covers 31 species of this genus of wasp, the bulk of the book being devoted to its taxonomy. Another group of Pemphilidine wasps has been studied by Pate (*Transactions of the American Entomological Society,* 73, p. 1). This author discusses the genera and species of this group, and includes descriptions of several new species. The area involved is the Caribbean.

Cushman has published "A Generic Revision of the Ichneumon-Flies of the Tribe Ophionini" (*Proceedings of the United States National Museum,* 96, p. 417). This group is parasitic on lepidopterous larvae. Another group of ichneumon flies of the genus Casinaria has been studied by Walley (*Scientific Agriculture,* 27, p. 364). This article concerns those species occurring in America north of Mexico. The several species of *Casinaria* play an important role in the economy of forest insect pests, particularly Lepidoptera.

Although ants constitute one of our most numerous groups of insects, the taxonomic work on the different groups has always presented certain difficulties. Smith (*The American Midland Naturalist* 37, p. 521) has published a generic and subgeneric synopsis of the ants of this country, based on the workers. In this she recognizes 61 genera. There is a key to subfamilies and under each subfamily a key to genera and to subgenera. Smith has also published "A Study of Polyergus in the United States, Based on the Workers" (*American Midland Naturalist* 38, p. 150). This genus includes the obligatory or true slave-making ants, commonly referred to as Amazons, the workers being entirely dependent on slaves for the construction of nests and for the feeding of themselves and their brood. There are only three recognized species and about a dozen subspecies and varieties of *Polyergus* in the world, but these ants have a wide distribution in the Holarctic region. A third paper by the same author (*Proceedings of the Entomological Society of Washington* 49, p. 29) deals with the genus Cryptocerus, a group of neotropical ants occurring in southern United States where three forms have been recorded. These ants are arboreal in habit, forming small colonies in the cavities of plants and feeding largely on honeydew and the flesh of small arthropods. Weber (*Annals of the Entomological Society of America* 40, p. 437) has published "A Revision of the North American Ants of the Genus Myrmica." This genus is holarctic in distribution and Weber gives a key to the North American species and subspecies of workers.

One of the most important contributions to the taxonomy of insects published in this country during the year is Hubbard's *Fleas of Western North America* (Iowa State College Press). This is an impressive contribution and covers 236 species and subspecies of western fleas. The first chapter is historical and deals with early and present-day siphonapterists and the research contributions to the subject. The second chapter deals with the medical importance of fleas in connection with bubonic plague and typhus, and also with fleas as household and farm pests. Directions for field collecting and laboratory technique appear in Chapter 3. The anatomy of the flea in relation to its taxonomy is discussed in Chapter 4. This completes Part I of the volume. Part II, which occupies 331 pages, covers the systematic classification of the 236 species and subspecies and includes keys to the families, genera and species. Part III, comprising 120 pages, is an extensive annotated host index. This is a very interesting and useful piece of work and will be welcomed by all those interested in medical entomology as well as those interested in taxonomy.

BOTANY

By Howard J. Dittmer
Professor, University of New Mexico

EVOLUTION

Oskar Kuhn, a radical opponent of the theory of descent, claims that the fossil faunas and floras show only a succession in time but no true evolution. He bases his premise on the Algonkian fossils which have all types of invertebrates represented among them.

The presence of vestigial organs in the plant kingdom were discussed by Mahabale under four main types: the embryonic organs, later vestigial; the rudimentary organs exceptionally functional; arrested organs; internal vestigial tissue. Examples from the main groups of pteridophytes in terms of evidence from Devonian Floras, comparative developmental anatomy, and studies of mutation and natural selection were included.

CYTOLOGY

Chromosome mutations were induced in *Aloe arborescens* by Camora using X-ray with dosages ranging from 100 to 700 units. Analysis of the collected data shows that there are weak points in the chromosomes where breakage is more likely. Translocations may occur as a consequence of the formation of chromatic bridges.

Warmke reports that the treatment of living excised roots in vials partially filled with water at O° C. for 1½ hours before fixation in cold Benda's fluid was found to shorten chromosomes and to preserve details of chromosome morphology in a number of plant species.

Cytological studies of the Alismaceae and Bambuseae families were made by two different investigators. The action of colchicine, nicotine, temperature, and x-ray were observed on the root tips of *A. cepa*. Chromosome counts for various species of *Cassia, Hippeostrum, Gasteria,* and Aloe were also reported.

Four species of the genus *Coffea* were included in a study which investigated polyembryony, embryoless seeds, and double embryo sacs. All conditions were observed in members of this genus.

GENETICS

Some of the facts and theories as to the genetic basis for hybrid vigor and its relation to corn breeding are reviewed by Richey. He concluded: (a) that the interaction of dominant favorable genes remains the most probable explanation for hybrid vigor, (b) that the relative importance of hybrid vigor and of inherent productiveness as causes of the high yields of corn hybrids is not known, but (c) that the evidence continues to accumulate that the highest yields tend to be obtained when the best products of selection are used in hybrid combination.

A study was made by Guard of a tomato plant bearing abnormal fruits. These fruits consisted of an excessive number of carpels which did not fuse. The inheritance of this character indicated that it was due to the effect of a single recessive gene.

A significant increase in X-ray induced mutations in *Aspergillus terreus* and *Trichophyton mentagrophytes* was observed if the spores were previously irradiated with infrared radiation from 7,000 to 18,000 Å, with a maximum effect of 10,000 Å. The infrared alone did not produce mutation.

Colchicine was ineffective in inducing polyploidy in *Penicillium notatum* for Sansome and Bannan.

ECOLOGY

Baxter described the occurrence and role of fungi in plant succession in the major forest types of Alaska. The series included (1) forest and fungus succession of interior river valleys with meandering streams, (2) forest and fungus succession after the retreat of a mountain glacier, (3) forest and fungus succession where flora includes species characteristic of both coastal and interior forests, (4) forest and fungus succession of Kodiak Island, and (5) forest and fungus succession after the retreat of a glacier in the Pacific Coast region.

The timberlines of northern America were interpreted by Griggs as well as a study of recession of Mt. Washington, New Hampshire. He states that the size of the trees gradually decreases on higher slopes until it reaches a scrub 2-3 feet high. In the most exposed habitats, all upright branches are killed back, reducing the trees to completely prostrate carpets. The author concludes that the trees are slowly losing ground and that this is evidence that the climate is now more severe than formerly. The need for studies of tension zones between ecological units generally is emphasized so that such a study might provide a basis for the forecast of climatic change. Understanding of local trends of climatic change is important in shaping many long range human policies such as forest management, irrigation, and even city planning.

Douglass estimated the age of the General Sherman Sequoia tree to be 3,500 years, ± 500 years from cores taken on a burnt face. A study of other fallen trees in that vicinity showed that resistance to decay was greatest in the outer heartwood. The bark and sapwood often decay completely in 60 years. Vertical uniformity of ring growth was excellent up to within 30 feet of the top in a 265-foot tree.

Life zones based on climate or physiography proved less satisfactory than one based on the dominant species of the climax vegetation. In the northern intermountain region, between the divides of the Rocky Mountains and the Cascade Mountains, south to 45° N. latitude, 10 vegetation zones may be recognized: sedge-grass zone, above upper timberline; spruce-fir zone; arborvitae-hemlock zone; Douglas fir zone; Ponderosa pine zone; juniper-pinon zone; fescue-wheatgrass zone; wheatgrass-bluegrass zone; needlegrass-grama grass zone; and sagebrush-grass zone. Daubenmire made the above classification and further states that most plants are subordinates that depend on the presence of the few dominants which control the micro-environment. Animals, likewise, are usually subordinates, because they depend on the plants, directly or indirectly for food and shelter.

SYSTEMATIC BOTANY

A French paper recorded the success of growing the common mushroom, *Psalliota campestris*. Manures from horses which have had molasses mixed with fodder brought about a more complete ammoniacal fermentation.

The explanation for the reasons of using scientific and common names in plants was given a popular presentation by Svenson in "What's in a Name?"

Although the early followers of Buddha Gautama were not devoted to horticulture, certain plants native to India have been widely dispersed because of their connection with the religion. Burkill recounts the history of some of these plants, including *Nelumbium nelumbo*, the Sacred Lotus which was especially venerated as an honorific; *Ficus religiosa*, the tree under which Buddha attained enlightenment; and *Shorea robusta*, the species of tree under which Buddha was presumably born.

This section includes the most diverse papers and also the most numerous. Taxonomy of the algae, fungi, lichens, liverworts, mosses and ferns is included in addition to the work on the seed plants and articles on Paleobotany.

MORPHOLOGY AND ANATOMY

Relations between tissue organization and vascularization in leaves of certain tropical and subtropical dicotyledons were studied by Wylie. He observed that differences in the organization of the nonvascular tissues are related to intervascular transfer and are significantly correlated with the vascularization of the leaf blade.

Laticiferous tubes were described in *Eucommia* by Varossiean who found them quite different from those of the *Euphorbia* and *Cannabis* types. They were located in the primary bark, pith, and secondary phloem—a situation different from such tubes found in any other plants.

Following the formation of the root apical meristem, the stele and cortex promeristems enlarge mainly by intercalary growth to form the embryonic stele and the embryonic cortex, respectively, of the dormant embryo. Allen continues his description of the apical meristems of *Pseudotsuga* by describing the shoot apex as it arises from the free apex of the embryo as a result of the activity of surface cells. There is no "dermatogen" present at any stage of embryogeny. The root apical meristem is divided into three mother-cell zones and from each zone is derived respectively the embryonic stele, embryonic cortex, and the column, the latter giving rise to the bulk of the root cap.

WATER RELATIONS

A new method which makes it possible to measure cell permeability to water by single weighings was proposed by Homes. He found that the cell permeability of Dahlia roots to water increases with the level of protoplasmic hydration.

A critical study of the Torsion balance method of measuring transpiration was made by Weinmann and LeRoux. Their study of cut plants and intact plants of grains showed a correlation of only + 0.319 which indicated that determinations of water loss from cut plants can not be used as indices of true transpiration rate of the intact plant.

MINERAL NUTRITION

Aiyar observed the effect of soils deficient in PO_4 on root development of rice. There was an extraordinary elongation of the primary roots and an absence of secondary surface roots. The roots were deep reddish brown in contrast to the white color of the roots of fully matured plants. The addition of N or K did not alter this situation unless PO_4 was also added.

Mineral nutrition studies include a wide variety of plants in relation to many factors of growth. Included were such titles as, "intensified cropping to diagnose mineral element deficiencies"; "a method to determine relative borax contents of soils"; "the influence of soil aeration on the growth and absorption of nutrients by corn plants."

The significance of trace elements in plant growth assumes greater importance as methods of diagnosis become refined. Boron, for this reason, is now being thoroughly studied in relation to nitrogen metabolism and also in relation to the distribution of all major elements in plant tissue.

Magron reported that seedlings of *Solanum tuberosum* grow vigorously in virgin soils, permeated with mycorrhizal fungi, as long as their roots retain symbiotic association with the endophytes, through the agency of which they may obtain K, even from K-deficient soils, as well as N from organic nitrogenous soil matter.

The effect of rubidium, vanadium, copper, potassium, magnesium, calcium, phosphorus, sodium, zinc, and lead were investigated in their connection with absorption, growth and toxicity in plant development.

The role of zinc in Florida crop production was observed by Rogers. The content of virgin soils is about two pounds per acre and even though the yearly losses are small, it may be necessary to apply 10-20 lbs. per acre or to use a spray with 2-4 lbs. of $ZnSO_4$ per 100 gallons of water. Of the quantity applied, only a part is fixed by the soil, the remainder being leached away or used by the plants. Some of the zinc may be made unavailable to the plants by being changed to zinc carbonate, so that many users prefer to spray the plants directly.

The interrelations of the soil, atmosphere, and the plant and animal cycle in relation to health and disease was discussed by Anchter. Bonner described the role of organic matter in the nutrition of rice. He also confirmed earlier investigations that rice seedlings utilized ammonium rather than nitrate as a source of nitrogen.

PHOTOSYNTHESIS, PIGMENTS

Various papers were written on the position of chlorophyll and the carotinoids within the plastids of the leaf and the effect of these pigments of food synthesis. Strain summarized much of the work in this field in pointing out that xanthophylls and carotenes in conjunction with chlorophylls help maintain the universe of living organisms. Altogether, in the past 50 years, some 70 to 80 xanthophylls and approximately a dozen carotenes have been isolated. Strain gives a résumé of these pigments, their sources, both in animal and plant matter, their function in plant, fishes, birds, and man, the complexity of their mixtures as they occur in pigments, the isolation of xanthophylls and carotenes from the petroleum extraction method to the separation by chromatographic adsorption procedure, properties and chemical structure of these pigments and their action in living organisms.

RESPIRATION, FERMENTATION

Prevót measured the respiration of different regions of the root for several species and found the rate higher in the apical region than the distal regions. The fruits of *Hedera helix L.* were observed by Ulrich to have a gradual increasing rate of respiration in inmaturity up to a certain weight. After that point, the rate decreased until in the ripe fruits almost no CO_2 was produced.

The effect of inhibitors on the respiration and storage of cottonseed was investigated in Louisiana and disclosed that most deterioration which takes place in stored cottonseed is due to the action of enzymes in the seeds rather than to microbial activity.

GROWTH, REPRODUCTION

Slankis cultivated tomato roots in White's nutrient solution and reported best results at a pH 4.2-4.7. The peak of optimum growth was at pH 4.3-4.4. He also found that sterilization of the solution at 120° for 30 minutes instead of 15 permitted better growth—while sterilization at temperatures between 143-151° C. so altered the composition of the medium (split products of sugar) that root growth was depressed.

Mosses were successfully cultured in the dark on nutrient solutions containing glucose. No chlorophyll was formed but shoots developed on the protonemata from existing buds but light seems to be required for the origin of buds.

A review of the literature on plant tissue culture was made by White, bringing his review on the same subject, published ten years earlier, up to date.

GROWTH SUBSTANCES

Roots of young pecan trees were treated with indolebutyric acid and naphthaleneacetamide by Blackmon, who reported better growth from these substances than other growth-promoting chemicals, however, neither of the chemicals proved effective in preventing the shedding of pecan nuts.

W. J. Robbins has maintained tomato root tips in culture solutions through 125 transfers covering a period of more than ten years. The roots will synthesize biotin and pyridoxine if the solution is supplemented with thiamine or thiazole. There has been no evident change in the genetic nature of the tomato roots after ten years of culturing.

In a recent review, Went discussed the Avena method for the analysis of auxins, the chemicals which comprise the auxins, the form in which the auxin is found, auxin transport, the enzymatic aspects of auxin, and the processes in which auxin takes part.

RADIATION EFFECTS

Experiments concerning photoperiodism and sex in corn, bromegrass, oats, tobacco and *Kalanchoe* were reported by a number of investigators. In most cases the length of day has not only an inhibiting physiological function in the production of sex tissues but it may under some circumstances cause a sex reversal.

The relation of the photoperiod on the absorption and utilization of various soil nutrients was also considered with very definite results associated with changes in length of day.

Tubbs investigated the photoperiod of *Artemisia vulgaris* and induced it to flower under longer periods of illumination than the 12-12½ hours of daylight it normally received in Ceylon. The average extra illumination given was 6¾ hours daily.

OSMOSIS, PERMEABILITY

Plants of the Characeae were used in an experiment to determine the effect of heavy water and methyl alcohol (5 per cent solution). Cells of the plant were killed at a lower pressure with the alcohol than with heavy water.

Wieler set forth a theory of the growth in thickness of plant cell membranes in stating that it is purely a mechanical process, exactly comparable to spheritic precipitations with a honeycombed structure, *e.g.*, of zinc phosphate. These spherites are Traub cells, and their laws of development, which can be studied directly, are applicable without change to plant cell membranes. Their envelope is a precipitation membrane by which the solution penetrates in droplets and is precipitated in the inner solution, likewise in the shape of spheritic droplets, thus causing the honeycombed structure. The droplets assume an angular shape by their own pressure and that of the vesicle, and adhere to one another in radial and tangential direction, thus causing stratification. Wieler concludes that all honeycombed structures occurring in organic nature are of mechanical origin, *e.g.*, starch grains.

GERMINATION, DORMANCY

The effect of penicillin on seed germination was studied by Smith who reported that the various compounds of this substance had no inhibiting effect. When in an impure state, along with phenylacetic acid, indoleacetic acid, and furoic acid it may have an inhibiting effect and stunt root growth but this is owing to the aromatic acids rather than penicillin.

Orchid seeds were found to require a fungus for growth but seeds will germinate and grow for a time in soils in which the fungus has grown but was killed off, but will not develop in soils where the fungus has never grown. This indicates that the fungus secretes some substance into the soil which the orchid seeds require.

A new scarifying method for small seeds was described by Bledsoe, who claims it can be adopted for scarifying other seeds.

Other papers in this section included studies on temperature extremes in the germination of seeds, various storage methods, viability and vernalization.

Studies on seed coat impermeability of the Leguminosae by the Boyce Thompson Institute disclosed some subfamily differences. Seeds of members of the Papilionoideae were made permeable by shaking in a glass bottle 20 minutes, but soaking in absolute alcohol was without effect. Seeds of the Caesalpiniodeae were made permeable by soaking in absolute alcohol for 72 hours but, with one exception, were not affected by shaking. Seeds of Mimosoideae were intermediate in position, some responding to shaking and some to alcohol soaking.

TRANSLOCATION, STORAGE

Balas and Selman studied the movement of substances in 8-leaf tomato plants and noted that the total dry matter formed by leaves is greater in summer than in winter. This per cent differs little between morning and afternoon, suggesting that most translocation takes place concurrently with assimilation.

TOXICITY

Herbicidal effectiveness of many of the new hormone compounds, especially 2,4-dichlorophenoxyacetic acid, was investigated by many research workers. Allard and Swanson noted the effect of this substance on the seedlings of 22 crop plants and compared its reaction to several of the other herbicides. DeRose pointed out the danger of using such compounds too freely because of its lasting qualities in the soil and its inhibiting reaction on the germination of newly planted seeds.

The influence of artificial rainfall on the effectiveness of 2,4-D in oil or an aqueous solution of its ammonium salt indicated that in regions of heavy rainfall, the oil base should be used since the aqueous solution is much more easily washed from the plant and greatly inhibits the action of 2,4-D. With aqueous solutions, however, the effectiveness is not greatly retarded if the rain occurs at least six hours after the plants were sprayed according to controlled greenhouse studies. Field studies show that rain will inhibit the effectiveness of this hormone if it occurs within 24 hours of the time the plants were sprayed.

ECONOMIC BOTANY

By M. T. Henderson
Associate Professor, Pennsylvania State College

HYBRID CORN

Attempts have been made recently to estimate the value of hybrid corn in the United States. The percentage of total corn acreage planted to hybrid corn in this country increased from 0.1 per cent in 1933 to more than 50 per cent at present, and the acreage continues to increase. In 1947, several of the "corn belt" states devoted 95 to 99 per cent of their corn acreage to hybrids. Adapted hybrids yield 10 to 30 per cent more than the best open-pollinated corn varieties, with an average increase of about 25 per cent. It has been conservatively estimated that the total national production of corn during the critical war years of 1942-1945 was increased by approximately 1,800,000,000 bushels through the use of hybrid corn. The money value of this increase is in excess of $2,000,000,000. A specialized industry devoted to production and sale of hybrid corn seed has grown up in the past 10 years with an annual turnover of about $75,000,000.

The tremendous value of hybrid corn is a remarkable example of the application of knowledge gained from fundamental research. The basic principles underlying the superiority of hybrid corn were discovered during the course of experiments on a very modest scale conducted at Cold Spring Harbor, Long Island, and at the Connecticut Experiment Station in the early part of this century. (*Economic Botany 1,* 1947).

POTATOES

Since 1932, at least 34 new varieties of potatoes have been distributed to growers in the United States. Most of these new varieties are resistant to one or more of the major potato diseases and possess other desirable characteristics, such as high yielding ability and cooking quality. Based on the quantity of seed certified in 1946, the most widely grown of the new varieties are Katahdin, Chippewa, and Sebago.

One of the most serious diseases of

the potato in the United States is late blight. Although some degree of control is obtained by spraying with bordeaux mixture, the control is expensive and time-consuming, and all growers will not resort to this means of control. The ideal method of control should come from the development of highly resistant or immune varieties. This procedure became a possibility with the discovery of late blight immunity in a wild potato species, *Solanum demissum,* from Mexico. Through hybridization of this species with commercial varieties of potatoes, varieties have been developed which possess late blight immunity plus high yield and quality required of a variety for commercial production. Recently, the New York Experiment Station has released 11 new varieties which are immune to late blight (*American Potato Journal 24,* 1947).

The ring rot disease of potatoes was reported in the United States in 1932. It has spread rapidly until it now is present and causes appreciable losses in most of the potato growing areas of this country. Since seed stocks with only a trace of the disease may give rise to serious outbreaks wherever susceptible varieties are grown, ring rot has proved to be very difficult to eradicate. The most satisfactory solution to the problem would be the development of resistant or immune varieties.

Although breeding stocks with immunity to ring rot have not been found, a fairly high degree of resistance exists in a few varieties. These sources of resistance are not suitable in themselves for commercial production but, through hybridization with high quality susceptible varieties, strains which combine good quality with resistance to ring rot have been developed. One of these strains has been released for commercial production with the name "Teton" (*Phytopathology 37,* 1947).

WHEAT

The common bread wheat possess 21 pairs of chromosomes which fall into three groups or genomes, each having seven pairs of chromosomes. These chromosome groups are designated as A, B, and C. Cytogenetic research indicates that bread wheat has a highly complex evolutionary history. Knowledge of this history has been valuable in wheat improvement. The three chromosome groups were probably derived from three different species, none of which has economic value. Many valuable characteristics have been transferred from the durum and emmer wheats to bread wheat types through interspecific hybridization. The durum and emmer wheats are known to have the A and B chromosome groups present in bread wheat. Stem rust and leaf rust resistance transferred from emmer to bread wheat has brought a saving to the farmers in the spring wheat belt of the United States of more than $135,000,000 in a single season. Recently, a single variety of spring sown bread wheat which has resistance to stem rust transferred from a durum wheat was being sown on 15,000,000 acres in the spring wheat section of the United States and Canada. In addition to resistance to stem rust and leaf rust, resistance to loose smut, stinking smut, mildew, and Hessian fly has been transferred successfully from durum and emmer wheats to bread wheat (*Journal American Society of Agronomy 39,* 1947).

WHEAT—MOLDY

Sick or moldy wheat is a condition in which the kernels have a dull appearance, discolored or blackened embryos, low germination, high fat acidity, and usually show mold growth. Species of *Aspergillus* and *Penicillium* appear to be the chief causative agents involved. Inoculation of sound wheat with fungi isolated from sick wheat at high moisture levels resulted in development of all the symptoms of sick wheat. However, sick wheat does not appear to be due entirely to the growth of fungi, though the metabolic activity of fungi favors the condition. Some of the changes associated with sick wheat can occur at high moisture levels without the development of fungi (*Cereal Chemistry 24,* 1947).

FLAX

Rust constitutes one of the most serious diseases of the flax plant. Not only do varieties of flax vary considerably in their reaction to rust but the flax rust fungus shows a high degree of variability in its pathogenicity on various flax varieties. More than 100 distinct physiologic races of this fungus, distinguished by their pathogenicity on 16 varieties of flax, have been identified. No variety of flax has been found that is resistant to all races found in North and South America. However, it may be possible to develop such a variety by combining through hybridization genetic factors for resistance to flax rust found in several varieties. Genetic research on the inheritance of resistance to rust in flax indicate that most of the genes for resistance occur in three series of alleles or three linkage groups. This simplicity of inheritance will make more difficult the tasks of combining resistance from different varieties due to its interference with the occurrence of new combinations (*Journal Agricultural Research 74,* 1947).

TOBACCO

The blue mold disease of tobacco seedling beds is a cause of serious damage in the southeastern tobacco growing states of Georgia, North and South Carolina, and Virginia. Epidemics of the disease have occurred each year since 1931, causing both loss of plants and delay in transplanting seedlings to the field. In 1945, 90 per cent of the seedling crop of some areas was delayed 10 to 20 days in transplanting to the field.

Research has been underway for several years in an effort to discover an effective control for blue mold which is easy to apply and inexpensive enough to be feasible. Results with some of the organic fungicides have been very promising. Effective control of blue mold in greenhouse and plant bed tests was obtained with sprays of bismuth subsalicylate, benzyl salicylate, acetyl salicylate, salicylamide, salicylic acid, sodium salicylate, benzoyl peroxide and Fermate (ferric dimethyldithiocarbamate). Of even greater interest, certain of these fungicides were just as effective when used as dusts for the control of blue mold. Compounds which were fungicidal as dusts and were physically suitable for dusting included bismuth subsalicylate, zinc salicylate and Fermate. Combinations of the salicylates and Fermate proved more effective than either of the components alone. These organic fungicides are relatively inexpensive and, when used as a dust, are easily applied (*Phytopathology 37,* 1947).

TOMATOES

Although the occurrence of the late blight disease on tomatoes has been reported repeatedly, it had never reached epidemic proportions until 1946. The disease has caused tremendous losses in potatoes for a long period but resulted in only slight damage to the tomato crop. However, in 1946 tomatoes in the entire east coast of the United States suffered severe losses from late blight. Some of the factors contributing to the epidemic are now becoming known. It appears evident that the disease began its development on tomatoes in the fall crop (1945) on the west coast of Florida and became destructive in the winter seedling beds, continuing into the spring. Inoculum of late blight was moved northward up the coast with the shipment of young plants in the spring where favorable weather conditions made possible the serious occurrence of the disease. Analysis of the causes of the epidemic indicate that rainfall was not as important in spread and development of the disease as were prolonged periods of high humidity since the casual fungus was relatively inactive unless the relative humidity was 95 to 100 per cent for more than 15 hours. During periods of favorable weather spores of the late blight fungus were carried distances of 30 miles or more by the wind (*Phytopathology 37,* 1947).

SOYBEANS

The Lincoln variety of soybeans produces three-fourths of the total soybean crop of the United States and is still increasing in importance. The variety originated from a natural cross between two introduced varieties at the Illinois Agricultural Experiment Station. It is outstanding in yield, quality of seed, standing ability, and oil content. The variety is adapted to the north-central area.

CHINESE CHESTNUTS

The Chinese chestnut appears to have more value than any other species of chestnuts for growing in the United States. This species and the unpalatable *Castanea mollissima* are the only species that are effectively resistant to chestnut blight. Chinese chestnut trees reach about the same size and shape as the apple tree, and it is similar to the peach in climate and soil requirements. Trees usually do not bear their maximum yield of nuts until they are 10-12 years old (*American Nurseryman 85,* 1947).

BERMUDA GRASS

Plant breeding research with Bermuda grass at the Georgia Coastal Plain Experiment Station, Tifton, Ga., beginning in 1937, has resulted in the development of a new superior variety of that important southern pasture grass. The breeding program was begun with 5,000 seedlings from common, Tibt, and two South African Bermuda grass strains. One of the best of these plants was increased vegetatively and has been named Coastal Bermuda. The Coastal variety equals or surpasses other Bermuda in all characteristics. It appears to be immune to the root-knot nematode, makes good quality grass hay, has exceptional longevity and produced nearly twice as much beef as common Bermuda grass in grazing trials (*Journal American Society of Agronomy 39,* 1947).

SEED YIELDS IN FORAGE GRASSES

Several investigators have reported increased seed yields in forage grasses from burning the sods, although the cause of these increases was not determined. During 1947, a report of results from burning the dead grass on sods of red fescue indicate that the increased seed yields obtained were probably due to a reduction in disease and insect injury. Burning in plantings where the disease incidence was less than 10 per cent had no effect on yield, whereas, on plots having severe disease infection burning increased seed yields materially (*Journal American Society of Agronomy 39,* 1947).

WEED CONTROL—2, 4

Dichlorophenoxyacetic acetic (2, 4-D) is effective as a herbicide when applied as a spray or dust on the foliage of various broad leaved weeds or to the soil in which these plants are growing. In general, most lawn grasses, such as bluegrass, red top, and red fescue, are relatively resistant to 2, 4-D but show some temporary degree of checking in their rate of growth. To hasten recovery of lawn grasses from the depressing effect of 2, 4-D, it has been found helpful to apply a readily available form of nitrogen fertilizer at the time of application of the herbicide. Experiments are now being conducted to determine the effectiveness of using a mixture of 2, 4-D and complete fertilizer in dry form for weed control in lawns. Preliminary results indicate that weeds can be controlled effectively in this manner (*Botanical Gazette 108,* 1947).

Interest is being shown in the possibility of controlling certain broad-leaved perennial weeds in small grains with 2, 4-D. If a crop of grain can be obtained simultaneously with the weed control measures, the cost of the control will be reduced. Spraying wheat, oats, and barley in the jointing and boot stage with the concentration of 2, 4-D required for weed control caused considerable depression in yields. However, the same applications made before jointing or after heading stages of growth did not seriously reduce yields (*Journal American Society of Agronomy 39*, 1947).

WEED CONTROL—2, 4-D.

Preliminary experimental results on the use of 2, 4-D for pre-emergence weed control in corn have been promising. The corn was planted May 31, and 2, 4-D was applied to the soil surface June 7, two days before emergence of the corn seedlings. Annual grasses as well as broad-leaved weeds were effectively controlled for about six weeks. An application of 2.7 lbs. of 2, 4-D per acre had no detrimental effect on the yield of corn (*Journal American Society of Agronomy 39*, 1949).

NEW TECHNICAL PERIODICAL

Publication of a new technical periodical entitled *Economic Botany* to be devoted to applied botany and plant utilization was initiated in 1947. The new journal is being published quarterly with E. H. Fulling of the New York Botanical Garden as its founder, manager, editor, and publisher. In addition, there is a staff of six advisory editors. The first edition was for the period January-March 1947. In the first issue, W. J. Robbins, Director of the New York Botanical Garden and one of the associate editors of the periodical, states briefly the justification for a new botanical magazine devoted solely to economic botany. It is pointed out that man is dependent on plants for all of his basic needs—food, oxygen, fuel, clothing, shelter, medicines, and many comforts and conveniences. In fact, the animal kingdom could not exist without plants. Yet there are relatively few periodical magazines devoted exclusively to the economic value of plants. The new magazine is designed to bridge the gap between knowledge gained from fundamental research and its application.

BOOKS

Root Disease Fungi—S. D. Garrett, Chronica Botanica Co.

Viruses and Virus Diseases of Plants—Melville T. Cook, Burgess Publishing Co.

Elements of Soil Conservation—H. H. Bennett, McGraw-Hill Book Co.

MEDICAL SCIENCES

MEDICINE, PATHOLOGY, PHYSIOLOGY

By Hamilton Southworth
Assistant Professor, College of Physicians and Surgeons,
Columbia University

GENERAL

In the medical sciences, the year 1947 was the first really to emerge from under the shadow of the recent war. University teaching centers were beginning once more to hit their normal stride, and that part of the flow of scientific articles which had formerly been stimulated somewhat artificially by the grants of the Office of Scientific Research and Development had almost died away. It appeared that the significant new work was scattered over a wider range of subjects, and it was obvious that it emanated from a greater number of centers. Scientific workers in the Middle West and the South were much more active than before the war.

Chemotherapy remained the chief field of endeavor, but work with new antibiotics, such as penicillin and streptomycin, was outdistanced by the use of anticoagulants and of such a physiological blocker as caronamide. In addition, the new tool for biochemical and physiological research which the isotopes furnish began to produce interesting results. The tracing through its metabolic course of the molecule labelled by an isotopic atom may well open up the next big field of medical discoveries.

ANTICOAGULANTS

The clotting of exposed blood is nature's chief protection against hemorrhage, but undesirable clotting within the blood vessels is the cause of thrombosis and embolism, which together are responsible for more deaths of persons over 50 than any other process. Coagulation of blood often begins insidiously in a small vein of the foot or calf and spreads upwards. This process is called thrombosis. The free end of the clot, which is soft and friable, floats in the blood returning to the heart. If it breaks loose, it is swept through the heart and into the lungs, where it lodges in one of the tapering arteries to cause pulmonary embolism.

How the body prevents the clotting of its normally circulating blood is imperfectly understood, but one of the agents is heparin, a substance first discovered in 1916. It is a mucoitin polysulfuricester containing 45 per cent sulfuric acid, and its action may be dependent on its strong negative electric charge. Heparin has been prepared in pure form and may be administered either intravenously or intramuscularly. Unless its absorption is artificially delayed, its effect is of only 2-3 hours duration, and continuous or prolonged administration is therefore necessary. Its anticoagulant effect can be quantitated by measuring the clotting time of blood drawn from a vein, and dosage can be adjusted so as to reduce any tendency to thrombosis and yet to prevent overt bleeding. An overdose can be neutralized by the injection of protamine sulfate, which may act because of its basic charge.

Blood clotting can also be reduced by means of dicoumarol, a substance discovered as the result of study of the bleeding disease in cattle that is caused by eating spoiled sweet clover. It acts by blocking Vitamin K, which is necessary for the synthesis by the liver of prothrombin, an essential portion of the natural clotting system. Dicoumarol can be given by mouth, but the mechanism of its action means a delay of 36 to 48 hours before a significant effect is noted. The dosage of dicoumarol can be quantitated by daily measurements of the prothrombin time of the blood, and an overdose can be temporarily corrected by a transfusion of whole blood or plasma, and overcome, after the essential lag period, by a large intravenous dose of Vitamin K.

For several years the thromboembolism which is particularly common in patients kept at complete bed-rest has been treated or at times prevented in a number of hospitals by surgical ligation of the leg veins in which the phlebitis usually develops. This is a simple procedure, and the edema which at times follows it is of no great importance. But the facts (1) that it does not correct the fundamental thrombotic tendency, and (2) that the clot may have formed insidiously above the point at which the veins are tied, have shifted the therapeutic emphasis during 1947 to the use of anticoagulants. Successful treatment of the following conditions has been reported.

VENOUS THROMBOSES

Of patients with venous thromboses treated by the old conservative program of bed-rest and elevation, 12 per cent had subsequent thromboses, 19 per cent subsequent pulmonary emboli, and 6 per cent subsequent fatal emboli. In contrast, a summation of 13 reports of cases treated with heparin and/or dicoumarol showed 1.1 per cent having subsequent thromboses, 1.2 per cent subsequent pulmonary emboli, and 0.3 per cent subsequent fatal pulmonary emboli.

PULMONARY EMBOLI

In one large series treated conservatively, of patients who had suffered one non-fatal pulmonary embolus, about ⅓ had further pulmonary embolization, 18 per cent had fatal pulmonary emboli, and further thromboses occurred in 14 per cent. In the cases treated with anticoagulants, 1.1 per cent had subsequent pulmonary embolization, 0.9 per cent had fatal emboli, and 1.1 per cent had further thrombosis.

CARDIAC INFARCTION

Myocardial infarction due to arteriosclerotic coronary thrombosis has a high mortality during the first few weeks both because of the development of further thrombosis and because mural thrombi developing within the heart where its wall is damaged cause emboli. Anticoagulants would appear to be the logical preventatives for these complications, and a large study of their effects is now under way. Preliminary reports indicate that the mortality of cases complicated by the presence of repeated thromboses or emboli can be reduced by anticoagulants to that of the average case, and that, in a small series, the mortality of the uncomplicated case can be approximately halved.

ACUTE PERIPHERAL ARTERIAL OCCLUSIONS

A preliminary report on the combined use of anticoagulants and measures to relieve reflex vascular spasm shows survival of the extremity in 80 per cent when aggressive therapy was started within 24 hours.

FROSTBITE GANGRENE

In this condition, a sludge of red blood cells forms in the capillaries following the exposure to cold and leads to thrombosis and gangrene. It has been shown in animals and in human volunteers that heparinization as late as 48 hours after exposure will prevent ischemic necrosis. Control animals and humans exposed similarly to cold invariably developed gangrene.

EMBOLI IN ASSOCIATION WITH AURICULAR FIBRILLATION AND RHEUMATIC HEART DISEASE

Reports, though favorable, are fragmentary, but the logic for the use of anticoagulants in this condition appears sound. At the present time, there is difference of opinion as to the relative indications for anticoagulants and vein ligation in thromboembolism, but it is generally agreed:

(1) Early thrombosis without pulmonary embolism should receive anticoagulants.

(2) When the thrombosis is not below the common iliac veins, anticoagulants should be given.

(3) Anticoagulants are contraindicated in recent central nervous system operations, subacute bacterial endocarditis except in the presence of an embolic arterial occlusion, hemorrhagic blood dyscrasias, recent threatened abortions and post-partum cases within six weeks of delivery. When phlebitis appears in these conditions, vein ligation becomes the treatment of choice. In general, it is customary to initiate treatment with dicoumarol and to cover the 36 to 48 hours before this drug takes effect by means of heparin. The patient is kept on strict bed-rest for about six days and then ambulated progressively. In uncomplicated cases, the dicoumarol is continued for a total of 12 to 13 days, and two to three days later the patient is discharged.

Bleeding is about the only toxic manifestation of the anticoagulants and has been recorded as occurring in 2 to 4 per cent of cases. Careful attention to controlled dosage and to the contraindications for therapy should keep toxicity nearer 2 per cent and make real hemorrhage very rare. Furthermore, the appropriate antidotes as described above are promptly effective in controlling the bleeding.

ISOTOPES

When an isotope is introduced into a compound utilized by living matter, the compound becomes tagged and the course of its metabolism can be traced by mass spectrophotometric or by radiographic means. By using H^2, N^{15}, C^{13}, I^{131} or other isotopes, it may well be possible to solve many of the biochemical problems of metabolism.

HEMOGLOBIN FORMATION

The synthesis of protoporphyrin, which is the iron-containing component of the blood pigment, hemoglobin, has been investigated by means of N^{15}. Rats were fed with ammonia and also with glycine, glutamic acid, and other animo acids in each of which N^{15} had been incorporated. Two weeks later their hemoglobin was tested for its N^{15} content. It was found that the isotope concentration of the protoporphyrin was 5 to 13 times higher in the glycine fed animals than in all the others. It could then be calculated that the nitrogen in protoporphyrin is directly derived from glycine.

In further experiments glycine labelled with N^{15}, was fed to a man in large doses for three days, and the isotope concentration of his hemoglobin followed for the next seven months. It was found that the concentration curve rose rapidly for about 25 days, remained almost flat for the next 70 days, and then fell along an S shaped curve. This curve could not be the result of a single process in which molecules were synthesized and degraded at random. Instead, it appeared that the probability of a hemoglobin molecule being degraded depended on its age, and the obvious explanation was that the hemoglobin, once formed within a red blood cell, remained there until the cell was destroyed. Measuring from the midpoint of the rising to that of the descending curve gave an average life span of 127 days for the red cell. The S- shape of the descending curve made it clear that the protoporphyrin of the broken down red cells was not reutilized for new hemoglobin.

RADIOACTIVE IODINE

Of the five radioactive isotopes of iodine, I^{131} is proving the most useful in physiological studies, because it has the convenient half life of eight days. It has been known for some time that the thyroid collects far greater amounts of labelled iodine than do the other tissues. The uptake after an oral dose can be measured by a Geiger counter over the thyroid area or, conversely, by the percentage of the administered dose excreted in the urine, in as much as the quantities taken up by tissues other than the thyroid are small and relatively constant. Thus a so-called tracer dose of I^{131} is proving to be a new and reliable test of thyroid activity, provided the patient has received no other iodine in recent weeks.

Radioactive iodine has also proved useful in studying the physiology of the thyroid. In chicks treated with increasing doses of thyrotropic hormone, the uptake of I^{131} at first increases, but a point is soon reached above which further increases lead to progressive increments in the size of the gland but to no further augmentation of uptake. In other experiments on thyroidectomized rats, there is very suggestive evidence that thyroxin can be newly formed even when the thyroid has been totally removed histologically.

Another group of workers has produced goitres in rats by means of thiouracil and has shown that, though there is some transient initial uptake of I^{131}, the percentage retained is only about 10 per cent. This furnishes good evidence that thiouracil operates by blocking the introduction of iodine into any organic combination.

It has long been known that thyroid hormone depresses the elaboration of thyrotropic hormone by the pituitary and thus indirectly decreases thyroid activity. In hypophysectomized rats, however, it has now been shown that, whereas the administration of thyrotropic hormone leads to an active uptake of radioiodine, the administration of thyroxin plus the same amount of thyrotropic hormone greatly diminishes the uptake. This suggests that thyroid hormone also inhibits the action of thyrotropic hormone on the thyroid.

Radioactive iodine has been used successfully in the treatment of Graves' disease, but its exact place in relation to thyroidectomy has yet to be determined as well as its optimal dosage. In the detection and treatment of thyroid tumors, it has also been shown to be of value, especially in better differentiated tumors which have a high iodine uptake. From one rather limited series it has been estimated that roughly 15 per cent of thyroid carcinomas may be expected to accumulate radioiodine to a significant degree. This property has proved invaluable not only in locating early metastases by means of the Geiger counter but also in the therapy of such lesions.

CARONAMIDE

Little evidence has accumulated that large doses of penicillin are any more toxic than small ones. However, the cost of the drug makes doses of over 1,000,000 units a day an appreciable item of expense. Administration of penicillin by mouth has a less predictable effect on blood concentrations of the compound than has intramuscular injection and is more apt to give unpleasant side-effects, but its chief disadvantage is that about five times as much penicillin is required to have a systemic action. For these reasons much effort has been devoted to developing some means of preventing the body from eliminating so rapidly the penicillin it absorbs and thus of allowing smaller doses to be more effective.

It has been found that caronamide, which is 4^{1-} carboxyphenyl-methanesulfonalide, blocks the excretion of penicillin by the renal tubules. It seems to act as a substrate competitor with penicillin and has the clinical advantage that it can be given by mouth. Its acute toxicity for animals is low, the LD_{50} for dogs for instance being 1575 mg/kg. Given to children in oral doses of 0.1 to 0.4 gm/kg/day for one to three weeks, the only toxic symptom was an occasional skin rash. Adults taking two to four gms. orally a day showed no unpleasant side-effects save for rare instances of mild gastrointestinal complaints, which may with equal likelihood have been due to other medications simultaneously administered.

Volunteers were given an intramuscular injection of 100,000 units of penicillin both before and while they were receiving four grams of caronamide orally every four hours. In every one the penicillin level in the blood was higher while they were on caronamide, but the effect was variable. After four hours the penicillin level was from four to 22 times higher than it had been without caronamide. The duration of an appreciable penicillin blood level was also considerably increased. Experiments were then carried out to determine how much more penicillin had to be given without caronamide to achieve a blood curve comparable to that with caronamide. Except at the time of the initial peak, it was found that 100,000 units with caronamide gave significantly higher levels than 300,000 units without the blocking agent.

In another study the effect of caronamide was tested when penicillin was given by mouth. Blood samples obtained one and two hours after the ingestion of 100,000 units showed an increase of at least two-fold over the controls in 80 per cent of the volunteers and an increase of four-fold or more in 40 per cent.

It may be doubtful whether caronamide will prove useful in the treatment of the great majority of infections which respond to relatively small parenteral doses of penicillin, but in the drug-resistant case it may be very valuable, and there is the possibility that it may extend the field of usefulness of orally administered penicillin.

THE LESSER CIRCULATION OF THE KIDNEY

By means of an X-ray technique whereby the course of injected radio-opaque material can be traced in the animal body and especially through the renal circulation, a group of workers at Oxford have contributed fundamentally to renal physiology. They started with crush injury and observed in this condition not only a diminution in caliber of the femoral vessels but one of the renal arteries as well. The renal changes could be produced equally well by stimulation of the sciatic or the splanchnic nerves and did not occur when splanchnicectomy had been performed. It was thus apparent that neurogenic mechanisms were responsible.

Turning next to a more detailed study of the kidney, the Oxford workers showed that under normal conditions radio-opaque material introduced *via* the renal artery first fills the cortical area and then drains back into the renal vein, lingering longest in the medulla. In the stimulated kidney, however, the radio-opaque material never reached the cortex but rather concentrated in the medulla, and its appearance in the renal vein was accelerated. By studying the exposed kidney it was then shown that a thin stream of red arterial blood could be seen entering the renal vein in the stimulated kidney so rapidly as to indicate the presence in the medulla of some channel whereby blood could bypass the more usual renal circulation.

A difference in the circulation of the blood going to the cortical glomeruli and the juxtamedullary glomeruli had been described, but further histological studies supplemented by vascular injections of neoprene with subsequent digestion of the renal tissue to leave casts of the vascular trees, emphasized its importance. Whereas the efferent vessels of the cortical glomeruli break up into a fine, capillary net-work between the tubules, those of the juxtamedullary glomeruli open instead into a number of straight venules of large caliber called the vasa recta. These course in bundles down between the tubules of the medulla and loop back without a capillary bed to enter the interlobular veins. In stimulated kidneys these vessels were engorged, and the medullary by-pass which they formed provided an alternative, "lesser circulation" for the kidney. Study of human kidneys revealed a similar anatomical structure, and in some older and more diseased specimens atrophy of the juxtamedullary glomeruli was occasionally seen with replacement of their capillary beds by a single vessel, thus further simplifying the potential shunt.

The impact of these findings on current concepts of renal physiology may be enormous. With two potential circulations a further variable is introduced into the relationship between renal blood flow and glomerular filtration rate. Moreover there is the intriguing possibility that inasmuch as the vasa recta are anatomically in close connection with the thin segments of the loops of Henle the lesser circulation may play a special role in water reabsorption. Clinically an explanation is given for the mechanism involved in cases of bilateral cortical necrosis and for the acute renal failure of shock and crush injury. It is tempting, moreover, to speculate whether in so-called essential hypertension overactivity of the sympathetic nervous system may not result in excessive operation of the normal mechanism by which blood flow is diverted from the cortex with resulting chronic cortical anoxia.

HUMAN STARVATION

Reports of semi-starvation in the prison camps of Germany and Japan led to the setting up in 1943 at the University of Minnesota of a controlled experiment in human starvation, the final results of which have now been largely published; 36 healthy young males served as subjects and for three months were standardized on the average daily intake of about 3,150 calories which was needed to maintain balance. Then for six months they went on a semi-starvation diet of 1,760 calories, planned to correspond with that reported from Germany and noticeably low in both protein and fat. At the end of this period, they were rehabilitated on a full diet and their recovery quantitated.

During the starvation period there was a mean weight loss of 37 pounds, which represented 24 per cent of the control body weight. Most of the weight loss was from the muscles, and there was a notable shrinking of the heart as seen by X-ray. The loss in strength for a single, voluntary, muscular contractation was about 30 per cent, but the loss in ability to continue exhausting work amounted to nearly 80 per cent. The loss in neuromuscular coordination was less than that in strength.

The average pulse rate under basal conditions declined to 35 per minute, and the average basal oxygen usage from 229.2 to 140.6 c.c. per minute. Both arterial and venous blood pressures fell, and the oxygen content of the mixed venous blood decreased 35 to 40 per cent.

Sensations of hunger, weakness, and depression were constant, and there was a marked sensitivity to cold. Sexual function was decreased, but visual and auditory acuity was unimpaired. There were practically no vitamin deficiencies, but peculiar brownish-grey patches appeared on the skin, and the normal vascularity of the conjunctiva and sclera disappeared.

Most interesting of all, however, was the appearance of edema without any significant fall in the serum proteins. Studies of blood volume revealed a 21 per cent decrease in the hematocrit as a result of anemia, but the total blood volume decreased only 8.6 per cent. The absolute plasma volume actually increased 8.9 per cent, but relative to the body weight the plasma volume increased 41.7 per cent. Estimates of the extracellular fluid volume, which includes the plasma volume, were made by measuring the thiocyanate space. Relative to the body weight, the thiocyanate space increased from 23.5 to 34 per cent, but actually the total absolute space remained remarkably constant. It appeared, therefore, that famine edema is primarily due to the disproportion created by the inability of the body to reduce its extracellular fluid when wasting of its cellular tissue is marked. Whether this is due to the fact that shrinkage of the cells reduces the elastic hindrances to expansion of the intercellular spaces is a matter for conjecture. Clinical edema did not ordinarily appear until the "thiocyanate edema" amounted to more than 8 to 10 per cent of the body weight.

In the period of rehabilitation, calories were of primary importance, and only when calories were restricted did extra protein prove of especial value. With an average daily intake of 3,000 to 3,500 calories, it was estimated that 50 per cent restoration to normal could be anticipated in 3-4 months and perhaps 70 to 80 per cent in six months. Depression, apathy, edema, and bradycardia were rapidly corrected. Weakness, anemia, and lack of endurance proved more persistent.

METOPON HYDROCHLORIDE

Since 1929, with funds provided by the Rockefeller Foundation, the National Research Council has coordinated a program to study drug addiction and search for a non-addicting analgesic comparable to morphine. Drug number 359 of this systematic study is metopon hydrochloride, which is methyldihydromorphinone. It is derived from morphine and probably will remain more expensive than morphine.

Metopon, however, possesses certain advantages which fit it peculiarly for the relief of severe chronic pain such as that caused by cancer. Studies indicate that its analgesic effectiveness is at least double, and its duration of action about equal to that of morphine. It is nearly devoid of emetic action. Both physical dependence and tolerance to it appear to develop more slowly. In analgesic doses it produces little or no respiratory depression and much less mental dullness than does morphine. Finally, it is relatively highly effective by oral administration.

At the present time, metopon hydrochloride is being distributed by the National Research Council in 3 mg. capsules for the treatment of cancer alone. An initial dosage of two to three capsules is recommended, to be repeated only on the recurrence of pain. Reports have been received of its use in about 500 cases, and in only one instance has nausea seemed attributable to the drug. In two or three cases there has been unusual sweating. The principal difficulty has been the substitution of metopon where dependence on morphine or demerol was well established. Allowing, however, for this difficulty, 75 per cent of cases have had satisfactory relief of pain, and in many there has been striking improvement in the patient's general comfort together with a clearing of the dopiness and nausea due to morphine.

POTASSIUM DEFICIENCY IN DIABETIC ACIDOSIS

For several years, the customary treatment of diabetic coma has consisted chiefly of large doses of insulin, the replacement of lost fluids and electrolytes by the parenteral injection of isotonic sodium chloride, the correction of acidosis by means of sodium bicarbonate or lactate, and generally the infusion as well of 5 per cent glucose solution. In spite of these measures, a few cases have died due to a secondary collapse after the blood sugar, the CO_2 combining power, and the blood pressure have been restored to relatively normal values. Some of these patients have been described as showing shallow, labored respirations, extreme weakness, and dysphagia.

It has now been shown that in some of these secondary collapses the serum potassium falls to extremely low values (2-3 milliequivalents per liter), and prompt relief of symptoms follows the administration of potassium salts by mouth or intravenously. It has long been known that diuresis and dehydration are accompanied by loss of intracellular water and potassium. It has been demonstrated that insulin withdrawal leads to an increase in urinary potassium, and diabetic acidosis produces a particular drain on the body's reserves of fixed base. Also known has been the fact that an injection of insulin leads to a lowering of serum potassium values. When extra glucose and extra insulin are given, this process is magnified as glycogen reserves are built up again in the depleted liver. Finally, the customary use of normal saline while furnishing sodium ions further dilutes the body's potassium stores. Thus by the combination of several different mechanisms, the serum potassium level is selectively lowered.

The final picture is not unlike that seen in periodic familial paralysis and has also been described in chronic renal acidosis. One university clinic in reviewing its cases estimates that 4 per cent of its mortality in uncomplicated cases of diabetic coma could have been prevented by potassium replacement.

RICKETTSIALPOX

In June 1946, reports of an unclassified acute febrile disease were received from a single housing development in Kew Gardens on the outskirts of New York City. Within six months, 144 cases, all non-fatal, in greater New York, were worked up, and the epidemiology and symptomatology of a new disease entity were reasonably well understood. To the disease the name of rickettsialpox was given.

The disease is characterized by an abrupt febrile onset with chills, fever, headache, sweats, and backache. About one week prior to the fever, however, an initial lesion can be detected in about 95 per cent of cases. This consists of a firm, red papule which becomes vesiculated and then develops into a black eschar. Within a day or two of the fever, a generalized rash appears, which at first consists of maculopapular, discrete, and erythematous lesions following no definite pattern of distribution. Later a deep-seated vesicle develops in each papule, and eventually a black crust forms. There is no itching and no pain. Mucous membrane lesions are occasionally seen, but the palms and soles appear to be spared. The rash lasts nearly a week, and at no time does the patient appear dangerously ill.

Laboratory studies show a moderate leukopenia with little or no elevation of the sedimentation rate. The common agglutinations including those for the usual Proteus strains are essentially negative. Blood drawn from one of the early cases, however, was shown by mouse passage to contain a rickettsial organism, and sera from convalescent patients all show complement fixation in high titre for this organism. The rickettsia of Rocky Mountain spotted fever seems closely related antigenically, for there is an 80 per cent overlap in complement fixation.

The rickettsia obtained from the patients has been named rickettsia akari. It has also been isolated from allodermanyssus sanguineus, an ectoparasite of mice. It therefore appears that the new disease originates in mice and is transmitted by their parasites to man.

The chief differential diagnosis is between rickettsialpox and chickenpox, but the deep, firm type of vesicle in the new disease and the presence of the initial lesion are clinical points of distinction, while complement fixation serves as the final proof.

SURGERY

By Edwin J. Pulaski
Brooke General Hospital, Brooke Army Medical Center

CHEMOTHERAPY OF CANCER

In the progress of surgery in 1947, several inhibiting agents have been found which are more or less effective in the treatment of tumors of man and animals. They may be divided into three groups, according to their action.

Necrotizing Agents.—It has been known for many years that certain bacterial products when administered parenterally to individuals with sarcomas produce severe hemorrhage in the tumors within a very short time with subsequent necrosis of the affected area of the neoplasm. The best known of these products is the polysaccharide derived from cultures of B. prodigiosus. Unfortunately, in most cases, the necrosis of the tumor is not complete, and, while certain of the tumors regress, some of the tumor usually remains viable.

Competitive Inhibitors.—It has been shown in cancer of the prostate that androgen is often an essential for the nutrition of the malignant cell. Tumors grow vigorously when androgens in appropriate dosage are administered, and the cells tend to wither away when the androgen supply is removed by orchiectomy, or when estrogen is administered. The effect of castration on carcinoma of the prostate gland is now well known. The use of estrogens with or without castration in such cases has resulted in varying degrees of success. Generally speaking, an increased survival rate prevails in treated cases. Equally important is the concommittant relief from pain, gain in appetite and weight, and the renewed vigor of the patient.

There is widespread current interest in treatment of cancer of the breast with hormones. It must be emphasized at the outset that the treatment is palliative and not curative. Radical surgery, with or without X-radiation, is still the only procedure recommended for curable lesions. Hormone treatment is presently reserved for trial for those patients whose disease has progressed too far to be amenable to operation. *Androgen* (testosterone propionate) appears to be useful chiefly in arresting the progress of bony lesions of cancer of the breast in some, but not all cases. Beneficial effects on the primary tumor or its spread to soft tissues are only inconstantly observed. The overall effects are best noted in pre-menopausal women. One undesirable feature of the treatment may be so-called chemical castration. *Estrogen,* in contradistinction to androgen therapy, may produce favorable but not necessarily lasting effects on soft tissue manifestations of cancer in older patients. The most suitable patients for estrogen therapy are 60 years of age or over. The treatment is contraindicated in patients who still menstruate or have recently done so, as it accelerates the growth of the cancer. At present, estrogen therapy seems useful as a palliative measure in older women with soft tissue manifestations of advanced cancer of the breast.

Agents Producing Nuclear Damage.—The damaging effect of irradiation on the cell nucleus has long been established. Certain radioactive isotopes, with a short period of half-life, now afford a means of presenting soluble radioactive chemicals to the organism as a whole. Radioactive phosphorus is probably the best therapeutic agent which is now available for polycythenia vera, and seems valuable in chronic lymphatic and myelogenous leukemia. The nitrogen mustards are another development in the cancer problem. They have been used in the treatment of Hodgkin's disease, with beneficial effects in selected cases. Still another agent capable of producing regression in cancer and leukemia is Urethane (ethyl carbamate). This compound is able to repress the growth of human prostatic cancer, probably in patients where a relapse has occurred after hormonal treatment with orchiectomy and estrogen. This drug is toxic, and great care must be exercised in its administration.

These advances represent a beginning of no small magnitude in the treatment of cancer. The main problem is to find an agent which is more specific for the cancer cell and less toxic to the human organism as a whole.

PLASTICS IN SURGERY

The use of plastics in the body is an outgrowth of tremendous expansion in the plastics industry. Plastics have been employed for years in the production of surgical and medical diagnostic and therapeutic instruments. The use of plastic materials in the body, however, is a recent application. The principle agents on which much experimentation has been done are methyl methacrylate (lucite and plexiglas); nylon; vinyl risins (Vinylite); polyethylene (Polythene); and regenerated cellulose (cellophane).

Methyl methacrylate is obtained by the polymerization of derivatives of acrylic acid. It is chemically inert and stable, is non-porous, transparent, and is easily sterilized. In repeated reliable experimental and clinical studies, it has been shown to be well tolerated in both animal and human tissues. Methyl methacrylate was found during the war to be well suited for the repair of defects of the skull, and various reports of its use in cranioplasty attest to its value. The properties of inertness in the presence of tissue juices, little or no resistance to X-rays, and no immediate or late tissue reaction make it admirably suitable for the closure of skull plates. Other uses found for methyl methacrylate are, in plastic surgery for sculpturally molded implants in facial deformities; and in the scrotum, for cosmetic and psychologic comfort, in patients who had had previous orchilectomies.

Nylon is a name applied to a group of polyamides, and chemically they resemble natural proteins. In the form of a filament, they have been used to fabricate such articles as parachutes. The use of parachute nylon as an inert, non-toxic wound dressing was described in the 1946 review. It has toughness, elasticity, impenetrability to granulation tissue, inertness, and ability to withstand repeated autoclaving without deterioration. Clinical trials of nylon as suture material have been reported in the literature. The principal objection to its use is the greater tendency of knots tied with the material to slip than when silk sutures are used.

Vinylite is a trade name applied to a variety of vinyl resins. The vinyl compounds have found extensive use in the formation of prostheses in plastic surgery, and in forming protective layers over the skin, as around ileostomies and colostomies.

Polyethylene, a polymer of ethylene, is a tough, thermoplastic resin that has a slightly cloudy appearance. It is flexible, resistant to water, and chemically inert. Its flexibility, translucency, toughness, and the facility with which it can be made into any size of tube or any thickness of film suggest multiple uses in the field of surgery. At the present writing, polyethylene is being evaluated in experimental animals to determine tissue reactions. In dogs, it has been found most promising as a permanent prosthesis in the repair of various organs, particularly in reconstruction of the common bile duct, in replacement of blood vessel segments for anastomosis, and as a dural substitute when this membrane was sacrificed. Polyethylene, after varying intervals of contact with tissues, appears unchanged, non-adherent, and does not become imbedded in dense scar tissue. Blood clotting is greatly delayed in polyethylene tubes, and penicillin is not inactivated in them after contact for more than 24 hours.

Cellophane has been evaluated in man and animals, but the reports to date are contradictory. It appears, however, that cellophane is, in general, a severe tissue irritant, of use in the body only to incite scar tissue.

TELEVISION IN SURGICAL OPERATIONS

During the year, surgical operations were televised for the first time at certain hospital centers and at a Clinical Congress of Surgeons. Generally, two cameras are used. One is fixed four or five feet above the operating table, and the second is installed in the gallery to give a general view of the operating room. The surgeon provides a running commentary through a microphone. The experiments have proved to be eminently successful. Images on the viewing screens were so sharp that, in one experiment, the numbers on a dollar bill placed on the operating table could be clearly read. Thus, demonstration of operations to a group of more than four may now be satisfactorily effected through the medium of television, even though, for the moment, reproduction is only in black and white.

BLOOD VOLUME AND THE CHRONICALLY ILL SURGICAL PATIENT

Intensive studies of chronically ill patients with infection and malignancy have defined a syndrome known as "chronic shock." This is characterized by weight loss, decreased blood volume, decreased blood proteins, increased interstitial fluid volume, and increased susceptibility to shock correctable by transfusion replacement of the blood volume deficit. For some time it has been known empirically that the chronically ill patient required blood preoperatively because it was the usual experience that, unless the patient received blood before operation, he could not withstand a major surgical procedure without developing complications. By determination of the blood volume, the actual deficiency can be measured quantitatively and corrected by the administration of adequate amounts of whole blood.

The plasma dye technic is used to determine blood volume, and the patient's usual weight is used on the normal reference standard. The mechanism of reduced blood volume in the protein-depleted patient is as follows: Osmotic pressure of the blood protein and tissue tension are perhaps two of the most important factors which regulate the interchange of fluid across the capillary walls. Inadequate protein intake affects not only the concentration in the blood but that in the tissue as well. Reduced total mass of hemoglobin and plasma proteïns is known to favor a loss of fluid and protein from the vascular to the interstitial fluid compartment, and reduced blood volume is a consequence. Studies on depleted patients have demonstrated the existence of a correlation of reduced body weight, reduced plasma volume, and reduced total mass of circulating blood proteins, both hemoglobin and plasma proteins.

The deficiency in blood volume represents a deficiency in hemoglobin and reserve stores of protein. The rate of synthesis of new hemoglobin is known to be limited despite its priority on protein. The administration of whole blood is the only means by which anemia can be corrected rapidly enough to permit urgent surgery. Transfusion of whole blood also deviates available protein to the more rapidly accomplished synthesis of tissue and plasma protein. Application of quantitative correction of blood volume deficits by whole blood transfusions in malignant disease and in chronic sepsis has yielded fruitful results.

EFFECTS OF WHOLE BLOOD TRANSFUSION ON PROTEIN METABOLISM

It seems that the use of whole blood transfusions as the only source of protein intake may obtain a positive nitrogen balance in patients during short but critical periods when oral protein feeding is inadequate or not feasible. From a nutritional viewpoint, whole blood transfusions exert multiple effects. The plasma proteins soon leave the circulation and become immediately available for body protein needs. By supplying preformed red blood cells, body protein, which by priority would have been used for hemoglobin formation, is made available for other body needs. The proteins of the red blood cells are not directly and immediately available for body protein needs. The red blood cells remain in the circulation of the recipient and produce an increase in blood volume almost entirely due to an increased red blood cell mass. However, with an increased red cell mass, more red blood cells reach the end of their life span, and their contained protein then becomes available for general body protein needs. That this protein so liberated is reutilized by the body is indicated by the finding that with an increased red blood cell mass, no increased urinary nitrogen excretion was noted.

D.F.P. (DI-ISOPROPYLFLOURO-PHOSPHATE)

D.F.P. is a compound developed during the war, which inhibits the cholinesterase of serum, red cells, muscle, and brain. It is cholinesterase that hydrolyzes the acetylcholine released at nerve endings. D.F.P. is a colorless, oily liquid which is prepared in peanut oil or propylene glycol as a 0.1 per cent or 0.2 per cent solution, in which it is relatively stable. Aqueous solutions are unstable. In this concentration it can be injected intramuscularly or applied to the eye without irritation. D.F.P. probably facilitates excitatory transmission in the cord and brain stem. The administration of 2 to 3 mg. intramuscularly decreases plasma and erythrocyte cholinesterase, and since the action is irreversible, even after a single dose the plasma esterase does not return to normal for many days.

Studies in man have included trials in myasthenia gravis, glaucoma, and postoperative ileus of the intestine. In myasthenia gravis, D.F.P. has proved less effective than prostigmine; the drug may be useful, however, as a supplement to prostigmine, diminishing fatigue when the patient first awakes. D.F.P. is about five times more potent and persistent a miotic than physostigmine. In concentrations of 0.05 to 0.1 per cent, which are non-irritant, it usually lowers the intraocular tension of glaucomatous eyes even where pilocarpine and physostigmine have failed. On the intestine, D.F.P. exerts a powerful stimulant action, with increase in tone, rate, and amplitude of contractions; this can be abolished by atropine. In postoperative paralytic ileus, present studies suggest it is at least as powerful as prostigmine; the two drugs given together have a potent cumulative action. D.F.P. appears to have a promising future both in therapeutics and for the light it may throw on the mechanism of neuromuscular transmission.

VAGOTOMY FOR PEPTIC ULCER

Mention was made in the 1946 review of the operation of complete division of the vagus nerves to the stomach for treatment of intractable duodenal ulcer. Numerous reports in 1947 attest to the profound influence of this procedure on the surgical management of ulcer, and further evaluation is now possible. The operation is based on the concept that ulcer is a phenomenon of hyperacidity and that, in patients with peptic ulcer, the excessive, continuous secretion of gastric juice is neurogenic in origin. This hyperacidity is abolished by complete division of the vagus nerves of the stomach. The clinical results of the operation, in the main, have been excellent, but there are some untoward effects. One is a profound decrease in motility of the stomach postoperatively. This is managed by decompression with stomach tube for five days following the vagus section. Where considerable retention of food has been noted before operation, it would seem wise to do a gastro-enterostomy in conjunction with vagus section. Other complications and undesirable sequelae which have been encountered are intercostal pain and neuralgia, pleural effusion, pulmonary atelectasis, and diarrhea. For the most part these have been mild and self-limited. Careful attention to postoperative care reduces the incidence and severity of most of them.

Where symptoms of ulcer persist after operation, it is postulated that not all the vagus nerves were divided. A second operation may be necessary or desirable under these circumstances. Vagus section seems effective in controlling recurrence of ulcer in patients following subtotal gastrectomy. The operation is not recommended for treatment of gastric ulcer because the surgeon is never sure that an ulcer of the stomach is not malignant. There is still no unanimity of opinion as to whether the operation is best performed through the abdominal approach or the trans-thoracic approach. The former route has the advantage of permitting a direct approach to the pathology, and to the stomach should gastroenterostomy be decided upon.

PERITONEAL LAVAGE FOR ANURIA

Acute renal failure and uremia occur in certain cases in which irreversible renal changes can not be demonstrated. Transfusions with incompatible blood, sulfonamide intoxication, renal injury from poisoning with heavy metals or other substances, toxemia of pregnancy, hemolytic reactions, shock and anuria for certain urologic and surgical procedures, all may produce acute renal insufficiency. The treatment of insufficiency by extrarenal excretion of waste products was found practicable in experimental animals as early as 1914. The method consisted in using the peritoneum as a dialyzing membrane. Within the year 1947, experimental and clinical reports appeared on peritoneal lavage as a means of treating acute renal insufficiency. Advances contributing to the feasibility of employing this technic successfully are: 1) the finding of a lavage fluid that has the proper electrolytic pattern and tonicity (modified Tyrode's solution); 2) the prophylactic value of antibiotics (penicillin and streptomycin in the dialysate against peritoneal infection); and 3) elimination of clotting difficulties by adding heparin to the irrigating solution.

Peritoneal dialysis is a more or less formidable procedure, and for this reason its use is restricted to cases of acute renal failure associated with reversible renal changes which have not responded to adequate trial of routine intravenous therapy and supportive measures designed to promote excretion of urine. If these routine measures fail and it appears that fatal termination may result, extrarenal excretion by peritoneal dialysis is indicated, and may, indeed, be life saving.

SOME PHYSIOLOGICAL EFFECTS OF WOUNDS

Reports in the recent literature describe new principles in the treatment of the severely wounded, based on study of more than 1,600 battle casualties in the Mediterranean Theater of Operations in the Second World War. Most severely wounded men do not suffer acute pain; three quarters of those arriving at the most forward hospital, even though they have had no morphine for five hours or more, were discovered not to be suffering enough to want anything done about it. On the other hand, those with shock due to blood loss nearly always complained of severe thirst. Patients with this condition were tided over, wherever possible, with plasma. It is noted, moreover, that, in Italy, the plasma was much less depleted than the red blood cells—so much so it was postulated there must be some unknown reservoir in otherwise healthy males of proteins in the body which is drawn upon in an emergency.

It was shown that the quantity of blood and plasma needed for resuscitation can be reduced to about half of that called for by older and slower methods. At the same time, delay in undertaking surgery because of shock can be cut about two-thirds by whole blood transfusions while the surgeon is at work. The importance of these studies is paramount. This economy of time and material will clearly be essential if military action ever takes place in inaccessible regions of the world, such as the polar regions, or if large numbers of the population should ever be subjected to atomic radiation, with consequent great blood loss from serous surfaces.

TOXOID IMMUNIZATION IN EXPERIMENTAL GAS GANGRENE

Cumulative experiences in both World Wars threw considerable doubt on the efficacy of gas gangrene antitoxin as a prophylactic for contaminated traumatic wounds. During the past five years, work in connection with the protection from gas gangrene wound infection has been intensified. The development of a toxoid against Clostridium welchii was one of the high priority projects of the Committee on Medical Research during the war. A toxoid has now been produced which is effective in producing immunity against a severe form of gas gangrene developed in experimental animals. The success of tetanus toxoid was excellently demonstrated in the Second World War. Fewer than a dozen cases of tetanus developed in tetanus toxoid immunized battle wounded American soldiers. It remains to be proved whether the same measure of success can be achieved with organisms producing gas gangrene. This first stage of the development of gas gangrene toxoid gives promise as to its worth in humans, but a large scale clinical experiment will have to be carried out to give clear-cut demonstration of its value. In total war, and with the atomic bomb, the civil population will need such protection as much as, or more than, the armed forces.

BACTERIOSTATICS IN BILIARY DISEASE

The sulfonamides, penicillin, and streptomycin are excreted in the bile of healthy men and animals. Theoretically, they should be of value as a substitute or adjunct to surgery in cholangitis and empyema of the gallbladder, and they might cure those chronic typhoid carriers in whom the gallbladder has proved to be the reservoir of the organism. Unfortunately, it has been shown that, where there is clinical or laboratory evidence of liver disease and dysfunction, excretion of chemotherapeutic drugs may be absent or reduced; whereas if the biliary tract is returning to normal function after surgical drainage these drugs are excreted in the bile. The bacteriostatic agents reach the gallbladder through the cystic duct. When the cystic duct is obstructed, the drugs are not found in the gallbladder bile, showing that they enter the gallbladder through the biliary ducts and not through the blood stream. The prospect of cure by chemotherapy in acute or chronic infections of the biliary tract is therefore not very bright since neither penicillin nor streptomycin nor the sulfonamides will be excreted in the bile in significant amount if there is intrahepatic or extrahepatic biliary disease. Furthermore, concentration in the gallbladder will depend on potency of the cystic duct, which can not be relied on in the type of patients among whom chronic typhoid carriers are usually found.

ANTISEPTICS

G-11 as an antiseptic for surgical scrubbing.—G-11 chemically is 2, 2′-dihydroxy-3,5,6,-3′,5,-6′ hexachlorodiphenyl methane. Several studies indicate that a 2 per cent solution of G-11 in neutral soap exerts a definite antiseptic action on the skin when used in a surgical scrub. The results are even more striking on the gloved hand, in that, while ordinary soap effects on bacteria are lost within a short time, the effects of G-11 are maintained during the usual period (one hour) of wearing gloves for surgical operations. There is, accordingly, a considerable enhancement by G-11 of the efficiency of the soap in reducing the possibility of wound contamination following puncture or tearing of a glove. Furthermore, scrubbing with 2 per cent G-11 in neutral soap produces the same reduction in bacterial counts of hands and arms in 90 seconds as is obtained in six to ten minutes of scrubbing with ordinary neutral soap when and provided G-11 soap is used routinely throughout the day. There are no reports thus far of skin irritation from G-11 in subjects who have been using it repeatedly. G-11 shows promise as a valuable addition to the surgeon's antiseptic armamentarium.

Furacin.—Penicillin and streptomycin partially, but not completely, meet the need for antibacterial compounds against surgical infections. Among the new compounds showing promise as a supplement to penicillin are the nitro-furans, of which furacin is a member. This compound exerts a bacteriostatic action on numerous gram-positive and gram-negative bacteria, is innocuous when applied locally, and does not appreciably retard the healing of experimental wounds. The compound is yellow in color, sparingly soluble in water, but more soluble in glycol compounds such as carbowax. Furacin is thermostable. It has been used successfully as a topical dressing in infected wounds, burns, dermatoses, and infected ulcers.

STREPTOMYCIN

The position of this antibiotic in the therapy of infections was clarified during the year. The bacteria more susceptible to streptomycin than to any other chemotherapeutic agent are the gram-negative bacilli, the non-hemolytic streptococci, and the tubercle bacilli. Streptomycin is indicated in the therapy of urinary tract infections, bacteriemia, including endocarditis, and bacterial meningitis caused by susceptible gram-negative bacilli. It is the most effective agent available for all types of tularemia, and, possibly, for lymphogranuloma inguinale. Dysentery caused by Shigella and Salmonella organisms when resistant to sulfonamides is usually resolved by streptomycin. This antibiotic has been found helpful in the treatment of otitis externa and chronic suppurative otitis media, ophthalmic infections due to gram-negative bacilli, chronic suppurative pulmonary infections, peritonitis of fecal origin, thrombopylephlebitis, and certain types of wound infections. The drug is complementary to penicillin in several of these conditions, and the two antibiotics may be given simultaneously to secure maximum effects. Streptomycin has a potent suppressive action on bacterial flora in the gastro-intestinal tract only when administered orally, and may be valuable for the preparation of patients for intestinal resection. The drug is proving an effective aid in the treatment of selected types of tuberculosis, both surgical and nonoperative.

Certain limitations make streptomycin less likely to be as important as penicillin in the treatment of infections. One limitation is the wide variety of sensitivity of bacteria to the agent in the test tube and the occurrence not uncommonly of naturally resistant organisms. A more serious drawback is the rapidity with which drug-fastness occurs in the test tube and in the body to this antibiotic when the infection producing organisms are not eliminated rapidly. Once drug-fastness has occurred, further streptomycin therapy is of no avail. A third limitation of this drug is that it seems hindered from entering an infected focus once actual necrosis has occurred. This limitation does not preclude its use as an adjuvant to indicated surgical measures. At the present time, streptomycin is expensive, a limitation of practical importance. The other factor which makes caution mandatory in the prescribing of streptomycin is the toxic effects it may produce, particularly when it is used in large doses for over long periods of time. These effects are mainly on the vestibular apparatus and are manifested by a disturbance of the gyroscopic function of the body. Fortunately, the symptoms of dizziness and staggering are usually not permanent. These objections notwithstanding on the basis of current experience, the use of highly purified streptomycin which is now available, is justified in all types of serious infections due to susceptible bacteria. Treatment certainly can be continued with safety for ten days. It may be that smaller doses, currently being evaluated for infections requiring prolonged treatment, may delay the onset of untoward reactions, lessen their severity, or eliminate them entirely.

XXIII. MEDICAL SCIENCES

PUBLIC HEALTH

By William R. Willard
Assistant Professor, Yale University School of Medicine

THE NATION'S HEALTH

Judged by mortality rates, the health of the United States in 1947 was excellent. For the first ten months there were slightly less than 3,000,000 deaths, and the provisional mortality rate was 10 per 1,000 population compared with 9.9 for the same period in 1946. The provisional infant mortality rate was 32.1 per 1,000 live births, a decrease of 11.6 per cent over the same period in 1946. (1)*

In the experience of the Metropolitan Life Insurance policyholders, the first nine months of 1947 set a record low death rate, 7.3 per 1,000 policyholders compared with 7.5 for comparable periods in 1945 and 1946. Among acute communicable disease deaths, new lows were reported for measles, scarlet fever, and whooping cough. Compared with 1946 deaths, however, poliomyelitis was lower, but diphtheria did not change. Despite an unfavorable spring, influenza and pneumonia reached new lows. These two diseases accounted for only 4 per cent of the total deaths compared with 10 per cent ten years ago. For tuberculosis also, a record low mortality rate was experienced. The favorable trend in maternal mortality continued. The appendicitis death rate dropped and was less than one-third of that of 10 years ago. Diabetes dropped slightly. However, the cardiovascular-renal diseases, now responsible for about half of all deaths from disease, increased slightly; and cancer, which accounts for about one-sixth of all deaths, reached a new high. The death rate from motor vehicle accidents was the lowest for any peacetime year since 1922, and home accidents reached the lowest point in history. (2)

The birth rate for the first 10 months of 1947 climbed to a new high of 26.2 per 1,000 population, 18.6 per cent higher than the corresponding period in 1946. An estimated 3,140,000 births were registered. (1)

COMMUNICABLE DISEASE PREVALENCE

The communicable disease picture was generally favorable according to reports through Nov. 15, 1947. Infantile paralysis outbreaks occurred in a few states; there were 10,071 cases reported compared with 23,894 for the comparable period of 1946. For the United States, smallpox gave promise of reaching a new low in 1947 (153 cases). However, an outbreak of 12 cases in April in New York City resulted in the vaccination of 6,350,000 persons in that city and thousands in the surrounding area. Diphtheria, with 10,511 cases, remained a problem, but there was a substantial reduction from 1945 and 1946. Whooping cough was prevalent. Substantial reductions occurred also for meningococcus meningitis, scarlet fever, typhoid, and paratyphoid fever, tularemia and endemic typhus fever. (3) (6)

LEGISLATION PROPOSED

President Truman, in a special message to Congress, emphasized the need for (1) adequate public health services, including an expanded program for maternal and child health; (2) additional research and medical education; (3) more hospitals and doctors in all areas where needed; (4) insurance against the costs of medical care; and (5) protection against loss of earning from illness.

A bill to create a National Science Foundation (S.526 Ammended) was passed by Congress but vetoed by the President who declared the bill was administratively unsound. "Full Government authority and responsibility would be placed in 24 part-time officers whom the President could not effectively hold responsible for proper administration." Furthermore, most of them would be employees of institutions eligible for Foundation grants. The President recommended the enactment of a basically sound bill on this subject.

---

* Numbers in parentheses refer the reader to the published references listed at the end of this review.

The President's Scientific Research Board recommended that 1 per cent of the National Income, or about $2,000,000,000, annually should be expended on research, half by Government, half by industry, education, and privately financed organizations. Expenditures for health and medical research would be tripled in the next decade. President Truman endorsed this recommendation. (10)

S.140 ammended, a bill to create a Department of Health, Education, and Security with a Secretary in the President's Cabinet, was reported favorably by the Senate Committee on Expenditures and Executive Departments and recommended for immediate action. The proposed Department would have three undersecretaries, one each for a Bureau of Health, for Education, and for Public Welfare. The Bill commanded wide support from many organizations but was opposed by the American Medical Association which urged a cabinet department for Health alone with a physician as Secretary.

No action was taken on S.1320, the successor to S.1600, the Wagner-Murray-Dingle Bill of the last session on Compulsory health insurance. Its sponsors say that it incorporates the major constructive suggestions made in the course of hearing on S.1606.

Hearings were held on S.545, introduced by Senator Taft as an alternate proposal to S.1320. Under this bill, if enacted, grants would be provided to states to develop programs which would provide hospital, surgical, and medical services in institutions, homes, or physicians' offices for those unable to pay, estimated to cover about 20 per cent of the population. Senator Taft said the program would cost about $200,000,000 a year, but it is believed by many that this sum would not be adequate.

The hearings on these two bills have shown definite areas of agreement between those favoring the Taft Bill and those favoring the Wagner-Murray-Dingle Bill. Both favor some type of medical insurance; both acknowledge the need for Federal funds; both are opposed to top-heavy Federal administration; both favor better distribution of medical services and in some instances more facilities and personnel. Both agree that those who can not pay for medical care should receive first call on whatever facilities are provided. Opinion is widely split on whether tax supported medical care should be available to all or limited to the medically indigent. (14)

The Senate Committee on Labor and Public Welfare reported favorably on S.176, designed to promote a national research program on dental illness. Preliminary hearing on a bill (H.R. 1980) to provide grants-in-aids to states for the diagnosis and treatment of physical and mental defects of school children were held.

FEDERAL APPROPRIATIONS

To implement previously authorized programs, Congress appropriated for the United States Public Health Service: (1) $17,399,500 for Venereal Disease Control plus $516,500 for grants to states for the operation of Rapid Treatment Centers; (2) $8,000,000 for Tuberculosis Control, plus $1,000,000 for research in streptomycin; (3) $15,682,000 for grants-in-aid to states for general public health purposes (this includes $3,000,000 for Mental Health); (4) $4,250,000 for research and training of personnel in Mental Health; (5) $7,500,000 for Communicable Disease Control; (6) $14,500,000 for the National Cancer Institute; (7) $9,626,000 for the National Institute of Health (includes $1,000,000 for streptomycin and cancer studies and is included in the Tuberculosis Control and National Cancer Institute figures); (8) $2,650,000 for the construction of research facilities at the National Institute of Health; (9) $4,500,000 for nurses training under the Bolton Act (this program is scheduled for termination in 1948); (10) $275,000 for International Health Relations; and (11) $3,600,000 for the United States Public Health Service management expenses, including Vital Statistics.

The Mental Health Appropriation will provide $400,000 for research; $1,000,000 for training grants in psychiatry, clinical psychology, psychiatric social work and nursing; $3,000,000 for grants to states to develop community mental health services; $850,000 for the site and plans for a National Mental Health Institute to be located in the vicinity of Washington, D. C.; and $2,250,000 for the operation of the United States Public Health Service mental health centers. An ultimate goal is to aid the states in developing a mental out-patient clinic for each 100,000 population and to serve residents of sparsely settled areas with traveling clinics.

The cancer program will be expanded with the appropriation of $14,000,000, of which $10,000,000 will go for research; $1,500,000 will be devoted to improving the teaching of cancer. Medical schools are eligible for grants of $10,000—$25,000 each for this purpose. Physicians will be trained in the diagnosis and treatment of cancer, and research expanded at the National Cancer Institute; research grants will be given to Universities, health agencies, and other professional non-profit agencies, and grants-in-aid for states will be provided to assist them in developing cancer control programs.

The Atomic Energy Commission received $5,000,000 for cancer research, limited to the nuclear aspects of the problem.

In budget hearings, Congress took cognizance of the fact that 30 per cent of all deaths between ages 20-59 were caused by heart disease in contrast to 11 per cent from cancer, and that 9,000,000 to 10,000,000 cases of chronic illness in the United States are caused by heart disease. Therefore, $2,000,000 of the National Institute of Health Budget will be devoted to research in heart disease, a substantial increase in expenditures for this work.

The Children's Bureau received for grants-in-aid to states $11,000,000 for maternal and child health services, $7,500,000 for crippled children, and $3,500,000 for child welfare activities. In addition, $3,000.000 was appropriated for grants to states for the Emergency Maternity and Infant Care program. This war program is being liquidated. Servicemen's wives pregnant prior to June 30, 1947 are eligible, and their infants are eligible until they are one year old. The program should end in April, 1949.

Congress appropriated $65,000,000 to the Department of Agriculture for the School Lunch program. It was reported that 19 states (incomplete returns), 50,000 schools, and 8,000,000 out of 26,000,000 school children were participating in the benefits of the program. However, from the evidence presented, many Congressmen concluded that most states were not contributing their fair share to this program. Congress served notice that states could no longer expect Federal help of this magnitude for the school lunch program, and that in the future, they would have to assume greater financial responsibility.

STATE LEGISLATION

Numerous laws were passed by the states related to various aspects of medicine and public health. The following may be mentioned: (1) Cancer: appropriation of $250,000 for research to be expended by the University of California; (2) Tuberculosis: authorization for an institute of research under the direction of the Municipal Tuberculosis Sanitorium of Chicago and the University of Illinois, provision for additional sanitoria in Illinois, Florida, and Tennessee, free care for tuberculosis patients in Iowa and Tennessee, examination for tuberculosis of school employees annually in Maine and biennially in Arkansas; (3) Venereal Disease: authorization for free hospitalization of cases in Vermont; premarital examinations required in Alabama, Delaware, Kansas, and Montana, prenatal blood tests in Arkansas, Kansas, and New Hampshire; (4) Licensing, inspection and regulation of hospitals required in Arizona, Florida, Idaho, Iowa, Kansas, Montana, Nebraska, New Hampshire, North Carolina, North Dakota, Oregon, South Carolina, Tennessee, Utah, Virginia, and West Virginia; (5) Physical Examinations: sight and hearing examinations required of school children in California; examination of school children and school employees may be required by school districts in Wisconsin; food-handlers examinations required in Wisconsin; (6) Surveys of Diseases: surveys for cerebral palsy in New York and Washington, rheumatic heart disease in California, and mental health in Pennsylvania are called for; (7) Vaccination: Diphtheria toxid and whooping cough vaccine for children under 12 may be provided free in Maine by health officers; smallpox vaccine may be distributed free in New Jersey.

LOCAL HEALTH UNITS

The National Conference on Local Health Units called by the American Public Health Associations Subcommittee on Local Health Units, was held at Princeton University in September. The 100 delegates from 65 voluntary agencies represented no fewer than 50,000 local organizations. It was pointed out that only 66.2 per cent of the population in the United States was served in 1947 by full-time Health Units, an increase of only 4.4 per cent since 1942. Of 3,070 counties in the United States, 1,372 were served by full-time Units, only 152 more than in 1942. The representatives of the 65 agencies declared they were ready to urge their organizations, through national, state, and local branches, to work toward complete Health Unit coverage in the United States. (35)

HOSPITAL DEVELOPMENTS

Under the terms of the Hill-Burton Hospital Construction Bill enacted in 1946, money was appropriated by Congress for the use of states in making hospital surveys. As of Nov. 15, 1947, the plans of 18 states (Alabama, California, Colorado, Florida, Idaho, Illinois, Indiana, Kentucky, Mississippi, New Mexico, North Carolina, North Dakota, Oklahoma, Tennessee, Texas, Utah, Washington, West Virginia) had been approved by the Surgeon General of the United States Public Health Service. Plans for five other states (Arkansas, Georgia, Louisiana, South Dakota, and Wisconsin) were either in Washington or the District Offices of the United States Public Health Service awaiting approval.

Congress established a contractual obligation against the Government of the United States for $75,000,000 for hospital and health center construction for the fiscal year 1947-48. This is the first of what is anticipated to be five annual appropriations of this amount. This money is for allocation to states as state plans are approved in accordance with a formula which recognizes the financial need of the states. This money must, however, be matched by state or local money in a two-to-one ratio. The allotment for approved plans totals $32,531,025 and the potential allotment of the five plans awaiting approval is $8,084,825.

The intention of the Hospital Construction Act is to give priority to rural areas and those in need of additional facilities. That this objective may be reached is indicated by the first applications for hospital construction submitted by Nov. 15, 1947, 86 per cent of them originating in communities of less than 10,000 population. Applications for projects in the following states had been received by mid-November: Mississippi, Oklahoma, Illinois, Indiana, Texas, Alabama, Kentucky, and Washington.

The average size hospital is 48.6 beds as determined from 33 applications in which the number of beds was stated. The cost per bed, as calculated from six applications for non-profit hospitals, is estimated at $12,318.79. (16)

REPORT OF THE COMMISSION OF HOSPITAL CARE

The Commission of Hospital Care published a report August 1947. It presents an "inspiring view of an integrated hospital system in place of today's crazy quilt . . . . of a general hospital which would offer care for all kinds of illness, instead of just acute medical, surgical and obstetrical patients." Affiliation of all hospitals with medical schools is urged. The Commission estimates a need for 45,000 tuberculosis beds, 195,000 general hospital beds, and replacement of 25 per cent of present hospital beds which are outmoded. The public would be better served by 40 per cent fewer but larger hospitals. At present costs, the Commission estimates $1,800,000,000 would be necessary to construct and equip hospitals to meet current deficiencies, and that operation at 75 per cent occupancy would add $375,000,000 to the nation's annual hospital bill. Also recommended were fewer but larger nursing schools, more diagnostic clinics in hospitals, Federal aid for low income states to lift the level of hospital care, and coordinated hospital and public health services. (19)

Additional courses in hospital administration have been organized at Yale, Johns Hopkins, and Toronto. This has been made possible by grants from the W. K. Kellogg Foundation. It is significant that they have been placed in schools of public health.

BLUE CROSS AND MEDICAL SERVICE PLANS

During the second quarter of 1947, Blue Cross enrolled 1,428,605 new members, the third highest quarter in its history. As of July 1, the total enrollment exceeded 25,000,000. More than 20 per cent of the population of the United States and 16 per cent of Canada were covered.

The Blue Cross Commission released the first enrollment report of affiliated or non-affiliated non-profit medical care plans. It listed 64 approved medical and/or surgical plans, 49 of them affiliated with Blue Cross. As of July 1, the total enrollment was 6,353,845. In 32 states served by 59 non-profit plans, 6.3 per cent of the population was enrolled; in six states more than 15 per cent; Delaware with 40.9 per cent and New Hampshire with 27.8 per cent were the leaders. (17)

Relationships between Blue Cross organizations and hospitals have been strained for some time. Blue Cross plans have grown tremendously in enrollment, benefits have been increased, and in 1946, the incidence of admissions and average period of hospitalization increased. During five years, rates to subscribers have been raised 15 per cent, but reserves have declined and a steadily rising per cent of earned income has been used. Blue Cross payments have not kept up with the cost of hospitalization. A Joint Committee of nine, representing the Board of Trustees, the Council of Administrative Practice, and the Blue Cross Commission produced the first of two reports aimed at re-adjusting relationships between hospitals and Blue Cross. The Committee adopted three principles: (1) plans should provide complete hospital care on a service benefit basis; (2) subscription rates should be adequate to provide plans with sufficient income to pay hospitals the amounts necessary to finance comprehensive hospital care; (3) subscription rates should be increased rather than benefits reduced when current plan incomes are not adequate. (11)

The United States Public Health Service issued a survey report of Blue Cross and Medical Plans prepared by Louis Reed, which concluded that the plans are beneficial to subscribers, hospitals, and the medical profession. The plans by themselves do not have the potentialities of providing comprehensive health service to the whole population, but with a high degree of governmental cooperation and assistance they might succeed. (26)

PERSONNEL PROBLEMS

The shortage of qualified professional personnel remained a serious problem. The United States Public Health Service, in studying 12 states, reported 1,847 unfilled positions of all types, an increase of 590 since July 1945. Other studies have confirmed the shortage of personnel. (4)

Low salaries was considered one reason for this shortage. Forty-eight physician candidates were asking $5,860 a year as the average minimum acceptable salary, but the average beginning salary was only $4,900. (7)

In an "Urgent Message to the Employees of Public Health Nurses," the N.O.P.H.N. on May 29, 1947 recommended that no nurse in public health work should receive less than $2,400, and that staff nurses who have completed approved training should receive $2,520 and up. The Executive Board of the American Public Health Association recommended that no physician in public health work with an internship and two or more years successful full-time experience should receive less than $6,000 and that those who have completed graduate training in addition should receive $8,500 or more, depending upon their experience and responsibility. Annual increments ranging up to $12,000 were recommended. (8)

The American Hospital Association and the Advertising Council in cooperation with other agencies conducted a national drive to attract 45,000 qualified girls to enroll in schools of nursing. (16) The National League of Nursing Education reported that by the end of 1947, 38,210 students will have been admitted to state accredited schools of nursing, an increase of 24 per cent over 1946.

PROFESSIONAL EDUCATION

Tulane University was accredited by the American Public Health Association to give the degree of Master of Public Health, thus increasing the number of accredited schools for this degree to 11. (27)

As reported in 1946, all schools are crowded to capacity and have a substantial number of foreign students. Figures for 1946, released by the Committee on Professional Education of the American Public Health Association, show that 1,468 students received degrees, 353 in public health, 63 in public health engineering, and 1,052 in public health nursing. The enrollment in Schools of Public Health increased by 90 per cent over the low of 1942-43, but while degrees granted in public health and public health engineering doubled, those in public health nursing increased by only one-third. (9)

Presidents of 19 American Universities joined March 15 in warning of the uncertain future of medical education. Dr. Alan Valentine, president of the University of Rochester, said: "Expenses of medical schools run as high as $4,500 or more per student per year. Few, if any, of the seventy recognized medical schools in the United States can be confident with present resources of maintaining in the future their programs at the essential high level." The presidents called upon the citizens of this country for "prompt and generous aid." (12)

New University centers for teaching occupational medicine and Hygiene were established at Yale, New York University, Jefferson, and the universities of Washington (Seattle) and Cincinnati.

HEALTH SURVEYS AND REPORTS

A report on the medical survey of the Bituminous Coal Industry, conducted by Rear Admiral Joel T. Boone, MC, U.S.N., was issued in accordance with the Krug-Lewis agreement. (20)

Important surveys in Alaska and among the Navajo and Hopi American Indians revealed serious health problems. (21) (22)

The Food and Nutrition Board of the National Research Council took cognizance of the fact that several species of animals (notably dogs) are susceptible to a toxic factor in nitrogen trichloride treated (Agenized) flour. Agene is used commercially for bleaching flour. The possibility of injury to human beings exists, though such injury has not been demonstrated. The Board recommended that alternative processes and suitable commercial equipment and controls should be made available to the mills as soon as possible, meantime reducing the use of nitrogen trichloride, but drastic or immediate restrictions were not indicated. (23)

A conference of six interested official and non-official agencies in April recommended that the United States Public Health Service, the United States Department of Agriculture and the United States Fish and Wildlife Service coordinate a campaign on a national scale to eradicate rabies, which has become a serious problem. (5)

THE CHRONICALLY ILL

A report entitled "Planning for the Care of the Chronically Ill" was issued jointly by the American Hospital Association, American Medical Association, American Public Health Association, and American Public Welfare Association. It noted that 25,000,000 persons in the United States have a chronic disease, that 7,000,000 have appreciable disability, and 1,500,000 are invalids; that chronic disease causes nearly 1,000,000 deaths and the loss of 1,000,000,000 man-days annually from productive activity. Recommendations were formulated covering research, prevention, facilities, home care, integration, and coordination of services. This statement focuses attention on planning to meet this large problem. (25)

OCCUPATIONAL DISEASES

The production and use of radioisotopes present a potential health hazard of tremendous proportions, particularly if nuclear energy becomes a source of power in general use and the present facilities for the disposal of radioactive wastes become inadequate. As part of this large potential problem, as yet unsolved, research institutions have been forced to consider the protection of their workers and others who may be exposed. Control measures include replacement and periodic medical and laboratory examinations, personnel monitoring to detect exposure of individuals to excessive radiation, bio-assy of excreta of persons who may have inhaled or ingested radioisotopes, area and research procedure monitoring; engineering to control dusts, fumes, and gases; and proper methods of disposal of radioisotopes. (32)

Although there are comparatively few reports in the literature, a new occupational disease is believed prevalent among beryllium workers. (33)

ENVIRONMENTAL SANITATION

The year 1947 witnessed the practical demise of Federal public housing programs, but Senator Taft plans to introduce in 1948 another bill for Public Housing. The Committee on the Hygiene of Housing of the American Public Health Association issued its manual of instructions on appraisal techniques for housing.

Hearings were begun on S.418, a bill to authorize $100,000 for grants-in-aid and loans to states for water pollution control and $1,500,000 for state surveys on stream pollution. (14) There is increased interest in septic tank design as evidenced by extensive research projects at the United States Public Health Service laboratory at Cincinnati and the University of Michigan. The American Public Health Association issued the 9th edition of *Standard Methods of Water Analysis,* containing many improvements in methods of water anaylses. Numerous articles on the newer insecticides and rodenticides have appeared in the literature. Much of the work was done during war years, but publication was withheld for security reasons. The emphasis in the field of environmental sanitation is gradually shifting from the classical problems of water and sewage to the broader social problems exemplified by housing.

INTERNATIONAL HEALTH

The constitution of the World Health Organization was ratified by 17 nations as of Sept. 29, 1947. Twenty-six countries must ratify to bring this organization into formal existence. The United States Senate unanimously passed a resolution favoring participation, and it is believed that a similar resolution will pass the next session of the House of Representatives.

Meantime, the World Health Organization is working actively through an Interim Commission which now has merged the technical functions of UNRRA, the Health Organization of the League of Nations, and the Office International d'Hygiene Publique. The 12th Pan-American Sanitary Organization voted to act as the Regional Office of the World Health Organization in the Western Hemisphere in accordance with the constitution of the WHO and the terms of an appended agreement. This change will take place when the agreement has been approved by the WHO and 14 of the American Republics.

Some of the activities of the year are as follows: (1) 192 students were selected from various countries for postgraduate training in public health, medicine, sanitation, and nursing; (2) medical literature was provided for Yugoslavia and will be provided for other countries; (3) missions of technical experts have been maintained in China, Greece, Italy, and other countries to assist the public health authorities and to train native personnel; (4) a committee of six was sent to the Middle East to study health problems incident to the pilgrimages to Mecca, and to make recommendations for the consideration of the WHO; (5) seven tons of medical supplies and vaccines were provided for Egypt within three days after their request by the Egyptian Health Ministry to fight the cholera epidemic which by Oct. 19th had resulted in 4,785 confirmed cases and 2,150 deaths; (6) ten technical committees have been appointed, including one to prepare a revision of International List of Diseases and Causes of Death, to study malaria, venereal diseases, and standardization of biological products; (7) plans for the first World Health Assembly to be held in the Western Hemisphere in 1948 were approved; (8) current epidemiological information was provided (toward this end the Singapore base, controlling 12 radio stations in the Far East, was taken over to relay epidemiological and technical information to public health and maritime personnel in that part of the world); (9) a limited program of technical publications was started; (10) negotiations with the International Labor Organization (ILO), United Nations Educational, Scientific and Cultural Organization (UNESCO), International Food and Agriculture Organization (IFAO), International Children's Emergency Fund and International Civil Aeronautical Organization (ICAO) were started to ensure a coordinated attack on mutual problems and to avoid overlapping (the cooperative attitude exhibited by all parties in such negotiations augers well for the success of the work).

The work of the International Children's Emergency Fund, designed to aid the suffering children of war-torn areas is significant. Priority aid will be the daily provision of one pint of milk to 5,000,000 children in Europe and China. As of Aug. 5, a budget of $20,000,000 was available. The United States committed $15,000,000, with a promise of $25,000,000 more, with a ratio of $57 for every $43 subscribed by other governments. Voluntary contributions will supplement this.

The United Nations Narcotic Commission has reviewed the problems of illicit drug traffic since the war, and made appropriate recommendations to the various governments. Especially important is the development of new synthetic narcotics which can be synthesized easily from readily available raw materials. One of these, demerol, is habit forming. Another, amidone, probably is also. Neither is covered by international conventions at the present time. Appropriate steps to draft a protocol covering the new synthetic narcotics and to circulate it among the various governments have been initiated through the

Economic and Social Council of the United Nations upon recommendation of the Narcotic Commission. (28) (29) (30) (31)

DENTISTRY

By Houghton Holliday
Professor, School of Dental and Oral Surgery, Columbia University

POST-WAR INCREASE IN ENROLLMENT IN DENTAL SCHOOLS

During the past 20 years, many of the dental schools of this country have not been filled to capacity in spite of the opportunities in the profession and the need for more dental service on the part of the public. However, in 1947, there were many more applicants than the schools could accommodate. The enrollment in the first-year classes of all the schools in this country for 1947 is 3,022. This higher appreciation of dentistry as a profession affords the schools an opportunity to select their student body with greater care and will undoubtedly be reflected in the standards of dental education and the caliber of those entering the profession.

In the past, the better students gravitated and were directed toward the more inclusive field of medicine. There was little allure for the prospective student in the unpublicized, undramatic, though very essential field of dentistry. Now for the first time all of the dental schools find themselves deluged with applicants for admission. On the basis of conversations with large numbers of applicants, it is evident that a very important factor in this sudden influx is the fact that veterans may now engage in professional study with substantial financial aid from the Government. The course of training is long and expensive, and this fact alone has prevented many well qualified individuals from applying in the past. This is not the entire answer, however, as to why so many are desirous of entering dentistry, for the veteran has free choice of the entire field of education.

Before the war it is estimated that only about 25 per cent of the population availed itself of any dental service. During the early days of the war, dental defects accounted for the highest number of rejections. It became necessary to change the policy and provide dental service after the recruits were inducted. As a result, many young men received dental service for the first time in their lives. The value of such service and the lack of dentists to provide it has been well publicized, and, as a result, many who previously were oblivious to dentistry, but who had an interest in the biological sciences and a desire to be of service to their fellows, decided upon dentistry as the field offering the greatest opportunities. In many instances, an important factor in this decision was the opportunity afforded enlisted men assigned to the medical corps to assist officers of the dental corps and to learn first hand something of the nature of the service rendered and its importance in the whole field of public health.

APTITUDE TESTING PROGRAM

The increase in the number of applications to dental schools has stimulated the move toward providing uniform and adequate aptitude tests for those desiring to enter this field. Some of the schools have developed their own testing program. Some use the results of tests administered by the Graduate Record Office, designed primarily for those seeking admission to medical schools. In 1947, dentistry instituted its own nationwide testing program. This program was planned by the Council on Dental Education with Shailer Peterson, Ph. D., serving as director of educational measurements, and is sponsored by the American Dental Association. The tests aimed to measure quantitative intelligence, linguistic intelligence, physical science vocabulary, biological science vocabulary, object visualization, reading ability in natural sciences, word dexterity, correctness and effectiveness of expression, carving dexterity. It is hoped that, as the program continues, it will be possible to determine in which of these areas competence is important. Some of the tests have been used widely in colleges and other professional schools, and thus the results provide a basis for comparison between entering dental students and those in other fields.

The scores of the year's entering class shows the group as a group to be very superior, in all but English composition, to the groups in other fields with which it was compared. In this case, the group score was slightly below the national average established by students who more recently had had work in this subject.

DECLINE IN NEGRO DENTISTS

The Director of Public Health and Preventive Medicine at Howard University has been engaged in a study of the distribution of Negro professional personnel in the United States. The report on the distribution of Negro dentists was made during the year by Dr. Paul B. Cornely. The report shows that, during the decade 1930-1940, the number of Negro dentists decreased from 1,773 to 1,471, or 17 per cent. During this same period, the Negro population increased by approximately 8 per cent. Thus, in 1940, there were 1,471 Negro dentists serving a Negro population of almost 13,000,000 or a ratio of 8,745 persons per dentist. The national average was one dentist to 1,800 persons. There was a decline in the total number of dentists during this period of .6 per cent. The 17 per cent decline in Negro dentists is also considerably in excess of the decline in the number of Negro physicians. The greatest decline occurred in the west central area of the United States. From 1940 to 1945, there was an overall increase of Negro dentists of 4.2 per cent over 1940, but this is still short of the 1930 figure.

This decrease in the number of Negro dentists parallels the decrease in the number of Negro students in dental schools. The slight increase since 1940 is attributed to improvement of the economic conditions of Negroes during the later period making it possible for more Negro students to apply to dental schools.

Dr. Cornely makes four suggestions aimed to relieve the situation: (1) develop the two schools for Negroes, providing fellowships, scholarships, and loan funds; (2) the other dental schools should assume a more liberal attitude and admit a larger number of Negroes to their classes; (3) a program of vocational guidance is needed in the Negro high schools and colleges of the south to stimulate qualified Negroes to enter the field; (4) the institution of a program whereby Negro youths of promise will be sent to dental school at community or foundation expense with the understanding that they return to their community on completion of their training.

SPECIALTIES IN DENTISTRY

Prior to the war, the Council on Dental Education had begun a study of the question of specialties in dentistry, but because of the war suspended action; it has resumed it in the past two years. In the meantime six states (Illinois, Kansas, Michigan, Oklahoma, South Carolina, and Tennessee) have enacted laws limiting the practice of a dentist as a specialist to those who meet the qualifications of the respective state boards of examiners. In the remaining states, it still is possible for any graduate dentist to set himself up as a specialist without having had training beyond that required of the general practitioner. However, the situation is not improved, and the public would be as much in the dark as ever when trying to avail itself of the services of a specialist, if the requirements for certification were to be left to the legislatures in each of the 48 states. The definition and preparation of a specialist must not mean one thing in one state and something else in the next.

In the medical profession, the Council on Medical Education took the view in 1933 that it was essential that uniform standards exist throughout the country and that if the states were to assume the function of designating qualified specialists only confusion would result. The Council on Dental Education, guided by the experience of the Council on Medical Education, which has approved 15 specialty boards, took the same position, declaring that any method of certification must be national in scope and must be under the control of each specialty board, with responsibility for determining the qualifications of one who claims to be a specialist resting upon the specialists themselves.

The Council on Dental Education has recognized the need for specialists in five branches of dentistry: oral surgery, orthodontics, pedodontics, prosthodontia, and periodontia. To qualify for the examination before the boards in each of the above fields, one now must be a graduate of an accredited dental school, a citizen of the United States, a member of the American Dental Association or the National Dental Association, be licensed to practice dentistry, take two years of advanced training, and have engaged for three years in practice devoted primarily to the specialty field.

RESEARCH ON DENTAL PROBLEMS

During 1947, dentistry made notable progress toward the solution of some of its basic problems. Research into the causes and prevention of tooth decay, and into the cause and prevention and treatment of diseases of the soft tissues of the mouth has resulted in considerable progress. Much of the research has been made possible by grants to universities from the U. S. Public Health Service, such grants being authorized by Congress in Public Law 410. Unfortunately, very little private money has found its way into studies on dental problems. The result has been that a large amount of potentially very important research has not been done. Many of the dental schools have staff members and other personnel who have the talent, training, and interest necessary for scientific investigation, but have been prevented by the deflection of practically all private funds to medical schools. It is encouraging that public funds are being allotted to research on dental as well as on medical problems.

It is not possible to predict which studies may ultimately prove to be most valuable, and it is equally impossible to present here a review of all those which show promise. One study which brings to light some important factors was conducted by J. F. Volker and D. M. Pinkerton. It is generally recognized that tooth decay (dental caries) is related to the retention of refined carbohydrates about the teeth and their subsequent breakdown into acids by the action of saliva. Accordingly, those forms of carbohydrates which were retained longest would have the most harmful effect on the teeth and should be avoided. Glucose was selected for the experiment because it can be detected by reliable quantitative methods and not because it is of any greater importance in the production of caries than other sugars.

Six young adults were used in the study. After testing the content of the saliva of each subject, the glucose was administered in 500 mg. quantities in the following forms: (1) wafer to be dissolved by sucking; (2) a cube to be chewed; (3) 4 cc. of a water solution to be churned in the mouth for one minute prior to swallowing; (4) with a gum base to be chewed for 30 minutes. An examination of the saliva, following the administration of the glucose, indicates that the mouth was cleared of glucose most rapidly when it was used as a rinse and slowest where sucked in the form of a wafer. There may be a definite relationship between the form in which we consume our sugars and the tendency to decay of the teeth. The findings bear out the often observed fact that caries is frequently rampant in people who habitually hold a candy wafer in their cheek. In a further study, the same investigators found that the carbohydrates present in various foods were converted to acid by a saliva mixture at a rate similar to those observed for refined sugars. It has been a common belief that the consumption of refined carbohydrates should be discouraged but that natural carbohydrates can be used with impunity. This investigation indicates that the question is one of quantity and concentration rather than kind.

PENICILLIN IN DENTISTRY

Penicillin is frequently referred to as the miracle drug, and it has proven to be a remarkably effective therapeutic agent against a variety of serious infections. On the other hand, it is ineffective in combating many others. Its great value does not lie so much in its action on a great variety of bacteria as it does upon the fact that there is so little danger in its use. There is an almost complete lack of serious toxic complications.

Orally administered, penicillin is highly effective in the treatment of Vincent's infection during the acute stage. Relief from pain is afforded in a matter of hours, and the inflammation subsides in a few days to the point where scaling of the teeth may be carried on without pain. Where the administration of penicillin has not been followed by scaling, the beneficial results have been transitory. The routine use of penicillin lozenges is severely condemned. The result may be an incomplete cure or the development of a tolerance for penicillin which renders future treatment ineffective.

In oral surgery, penicillin is efficient in the treatment of acute lesions, especially spirochetal infections, and seems to be more effective if given intramuscularly than by mouth.

From a study conducted by F. J. McClure and W. I. Hewitt, it seems that penicillin may be effective in the inhibition of dental caries. These investigators found that it was effective in inhibiting the development of a caries-like lesion which was induced in the teeth of rats. The L. Acidophilus organism has long been associated with the development of dental caries. It was found that penicillin, administered orally, reduced the concentration of this organism and greatly inhibited the development of the rat caries. The study suggests that human dental caries may respond to penicillin therapy.

PERIODONTAL DISTURBANCES

Dr. Isaac Schour and Dr. Maury Massler made an examination of the gingival tissue around the teeth of 3,905 Italians following the war. These examinations were part of a general medical survey conducted in various Italian cities by the Italian Medical Nutrition Mission. The dental examinations were made in the four communities of Naples, Varese, Cagliari, and Catanzaro. Those examined in the first two cities were from a particularly low economic level, were unclean, and suffered from various ailments. Those in the other two communities were slightly better off. The ages of those examined ranged from six to 60 years, and all suffered more or less from malnutrition.

Inflammation of the gingival tissue was found to be very prevalent, ranging from 40 per cent in the 6-10 year group to 98 per cent in the 51-60 year group. The severity of the disease increased with age, the acute forms being more prevalent in the young, and the chronic types in the old. The prevalence and degree of the disease appeared to be greater in the more poorly nourished groups, and considerably greater than has been observed in comparable age groups in this country.

While periodontal disease appears to be somewhat less prevalent and less severe in this country than in areas suffering from malnutrition, a very large percentage of the cases here might be prevented by early treatment of systemic diseases predisposing to periodontal disease (pyorrhea). Dr. B. O. A. Thomas, as a result of a study, advocates the institution of a program of preventive periodontia in conjunction with one of preventive orthodontics.

In discussing various conditions in childhood that lead to periodontal disease in the adult, Dr. Thomas refers to diabetes. In untreated cases of this disease, there is a lowered resistance to infection, and a gingivitis develops which progresses until the deeper tissues are involved and the disease is out of control. The degree to which diabetes may affect the periodontal tissue depends upon the damage suffered prior to the institution of treatment for the diabetes.

The thyroid gland, by regulating the metabolic rate, is extremely important in the maintenance of normal growth. Abnormalities of alignment of the teeth due to hypothyroidism are often responsible for periodontal as well as orthodontic problems in later years. Also, hypopituitarism is often responsible for delayed and irregular eruption and malalignment of teeth predisposing to food impaction with gingivitis resulting from trauma to the soft tissues.

The soft tissues of the mouth are often the first to exhibit signs of nutritional deficiencies. Scurvy is no longer common in the United States, but vitamin C deficiencies that are less severe result in a definite periodontal disease with loosening and drifting of the teeth and the formation of pockets. There is no apparent direct relation between the periodontal condition and epilepsy, but the seizures which are characteristic of this disease may be controlled by the use of sedative drugs which in many cases causes serious hyperplasia of the gingivae. Also, there are many local factors which, if neglected in the young, are responsible for the development of pyorrhea alveolaris in later life. Some of these are Vincent's infection, caries, trauma, faulty dentistry, poor mouth hygiene, malocclusion.

REGISTERED DENTAL HYGIENIST

As the importance of a clean mouth became more and more evident in the correction and prevention of dental disease, the dental profession endeavoured to find a way in which the teeth might be cleaned and patients educated in the care of the mouth without taking the dentist from work which demanded his greater skill and more extensive training. Years ago, Dr. Fones of Bridgeport, Conn., advocated the assistance of women, especially trained under dentists, as a solution of the problem. The idea developed in spite of the opposition of some in the profession who could not get away from the notion that a dentist must render every dental service with his own two hands. Today, the dental hygienist is recognized and registered in 38 states, the District of Columbia, and Hawaii.

In order to practice, she must graduate from an accepted school, pass state board examinations, and hold a license to practice in the state in which she is employed. In all types of positions, she must work under the supervision of a licensed dentist, and her work on patients is limited to the removal of calcareous deposits, accretions, and stains from the exposed surfaces of the teeth. At first, the dental hygienist was employed in dental offices, serving the dentist much as a nurse serves the physician, in addition to her special service to the patient. Later, it was found that her services could be more far-reaching when she was employed in the public schools.

Originally, the course of training was one academic year, but gradually it has been expanded to include more courses aimed to equip the graduate to take her place along with other public school teachers. Today there are 14 schools, ten of which provide a two-year course of training. In 1947, the Council on Dental Education set up requirements for the accrediting of these schools and made plans to inspect them in the near future. In general, the requirements specify that, to be accredited, a school for dental hygienists should be affiliated with a dental school, the course should be not less than two academic years in length, will be expected to maintain a standard of academic discipline that will permit full credit in all courses toward a bachelor of science degree. At the present time, there are eight universities that grant the bachelor of science degree in dental hygiene or health education following four years of work, two of which are in the schools for dental hygienists.

VITAL STATISTICS

By Halbert L. Dunn
Chief, National Office of Vital Statistics,
U. S. Public Health Service

BIRTH RATES IN 1946 AND 1947

In 1946, the first year after the war, the crude birth rate rose to a 25-year high of 23.3 per 1,000 population, including the armed forces overseas. In 1947, the rate increased still further and reached an estimated rate of 25.9 which is higher than any annual rate recorded since the birth-registration area was established in 1915. These rates are considerably higher than the wartime high of 21.5 set in 1943 and the rates for the last two war years, 1944 (20.2) and 1945 (19.6).

The importance of the increase in the birth rate during the post-war period for planning school facilities, housing, etc. becomes more apparent when the numbers of birth recorded for recent years are examined. Prior to 1946, the greatest number of babies born in this country occurred in 1943. During that year, 2,934,860 live births were registered. In 1944, the figure was 2,794,800, and in 1945 it fell to 2,735,456 which, nevertheless, was more than 200,000 above any year prior to 1942. An estimated 3,260,000 births were registered in 1946, but even this high figure was considerably outdistanced by the estimated number of 3,730,000 for 1947. When non-registered births are added to this last number, it seems likely that births will total 3,900,000 in 1947.

July 1946 marked the beginning of an extraordinarily rapid rise in the birth rate which continued to the end of the year and resulted in the high rate indicated above. The provisional rate for each month, starting with that of 27.9 for September, was higher than any previously reported in the history of the birth-registration area, and in December it reached 29.5. These provisional monthly rates are based on the number of birth certificates received by 46 states and the District of Columbia during a reporting period and are expected to differ slightly from the final rates. They contain an adjustment which places them on an annual basis, thereby making it possible to compare the rate for one month with that of another and with the rate for the entire year.

The birth rate in the early months of 1947 showed a tendency to decline from the monthly high set at the end of 1946. This downward movement was of short duration, and much of the variation in the following months was due to seasonality in the birth rate. The provisional birth rates for the last few months of 1947 were: 26, July; 25.8, August; 26.8, September; 26, October; and 24.4, November. December data are not available at this writing.

During 1946, every region of the country experienced substantial increases in the crude birth rate over 1945, with the largest increases occurring in the Middle Atlantic and East North Central regions. Present indications are that every state also experienced a rise in the birth rate from 1946 to 1947.

Contributing factors to the rapid increase in the birth rate at the end of 1946 and the high rate in 1947 are undoubtedly the heavy demobilization of the armed forces which began shortly after V-J Day and extended through the first half of 1946, the record-breaking number of marriages in 1946, and the high level of employment.

PERSON IN ATTENDANCE AT BIRTH

The proportion of births attended by physicians in hospitals has more than doubled since 1935. In that year, only 36.9 per cent were so attended as compared with 78.8 per cent in 1945, the latest year for which final figures are available. It is estimated that in 1946 and in 1947 the proportions were 81.5 per cent and 83.5 per cent, respectively. The proportion of births attended by physicians outside of hospitals declined from 50.6 per cent in 1935 to 14.7 per cent in 1945.

There has been less change in the proportion of births attended by midwives. Of all births in 1945, 6.1 per cent were attended by midwives, a reduction of nearly one-half from the 1935 proportion (10.7 per cent). The net result of these changes is that 93.5 per cent of all births in 1945 were physician-attended as compared with 87.5 in 1935.

National totals obscure the large differences between states which exist in the proportion of births occurring in hospitals. In 1945, there were 10 states in which more than 95 per cent of all births took place in hospitals, but there were six states in which less than 50 per cent of the births occurred in hospitals.

In both the white and nonwhite groups, there has been a continued upward trend in the proportion of births occurring in hospitals. Over the 10-year period 1936-1945, the proportion of such births in each of these racial groups approximately doubled. In 1945, however, the proportion of births of white infants in hospitals (84.3 per cent) was more than twice the proportion (40.2 per cent) observed among births of nonwhite infants. When births attended by physicians outside of hospitals are included, the disparity between the white and nonwhite groups is reduced, although it is still appreciable. In 1945, 98.0 per cent of all white births were attended by physicians (in or out of hospitals), while 61.9 per cent of the

[2] Includes reported annulments.

[3] Deaths under 1 year of age.

[4] Estimated.

[5] Birth rate and maternal and infant mortality rates are provisional.

— Data not available.

nonwhite births were attended by physicians. Births attended by midwives form a large proportion of all nonwhite births, 37.3 per cent, but are of negligible importance in the white group (less than 2 per cent).

The increase in the proportion of births occurring in hospitals and the decrease of nonphysician-attended births undoubtedly have been contributing factors to the decline in recent years of the maternal mortality and infant mortality rates (see below). The type of attendant and the occurrence of birth in a hospital are two of the more important factors in the preservation of life, since medical supervision at childbirth provides for surgical intervention and assures particular attention to the degree of asepsis and to the surroundings of the new-born.

DEATH RATES, 1946–1947

The crude death rate for the United States declined to a record low in 1946 of 10 per 1,000 estimated population. The previously lowest rate was 10.4, recorded in 1942. The estimated national death rate for 1947, based on data for the first 10 months of the year, was 10.1.

[1] Include entire continental United States, beginning with 1933.
[2] Include "unknown" and ages not stated.
[3] Excludes armed forces overseas.

The general downward movement of the crude death rate was interrupted during the war years. From the low point reached in 1942, the rate rose sharply to 10.9 in 1943, and remained at 10.6 in 1944 and 1945. However, as may be seen in Table B, mortality rates for almost every age group in the population declined during this period. These age-specific rates provide a better indication of changes in mortality risk than do crude rates, since they are less influenced by changes in the age composition of the population. During the war, such changes in population composition were particularly rapid, owing to the transfer of men in the armed forces to and from overseas duty. The mortality figures shown are for the continental United States and do not include armed forces overseas. The overseas population consisted, in the main, of physically fit young men among whom mortality is normally low. Their absence from the country during the war years left an older population, normally having higher mortality rates. Therefore, if no change in mortality risk occurred, the crude death rates for the continental population during the war years would be somewhat higher than during pre-war years. Conversely, the return to the United States of a large number of men in the armed forces may have been one of the factors responsible for the sharp decrease in the death rate during 1946.

DEATHS BY STATE

In 1946, crude death rates for residents of the individual states ranged from 7.5 for Utah to 11.7 for Montana, New Hampshire, and Vermont, with a median rate of 9.8. The number of deaths and death rates for each state are shown in Table C. While true differences in mortality conditions exist among the states, the major part of the variation in state crude death rates probably reflects the differences in the composition of the state populations with respect to age, race, and sex.

DEATHS BY CAUSE

The five leading causes of death in the United States in 1946, the numbers of deaths, and the crude death rates per 100,000 population were as follows: diseases of the heart, 429,230 and 306.8; cancer and other malignant tumors, 182,005 and 130.1; intracranial lesions of vascular origin, 125,646 and 89.8; nephritis, 81,701 and 58.4; and accidents (other than motor-vehicle accidents), 64,622 and 46.2. The first four of these causes also headed the list of leading causes in 1945. Pneumonia and influenza (combined), the fifth leading cause in 1945, dropped to sixth place in 1946 for the first time since the formation of the Death Registration Area (1900). Accidents, other than motor-vehicle accidents, was the sixth leading cause of death in 1945.

For the major infectious diseases, 1946 marked new record lows in the numbers of deaths and crude death rates. The number of deaths from pneumonia and influenza dropped from 68,386 in 1945 to 62,324 in 1946, a decrease of 8.9 per cent in the number of deaths, and the crude death rate declined sharply from 51.8 to 44.6, or 13.9 per cent. Tuberculosis caused 50,911 deaths in 1946 as compared with 52,916 in 1945, and the death rate for this cause was 36.4 in 1946 as compared with 40.1 in 1945. The proportionate decrease in the number of tuberculosis deaths was 3.8 per cent and that in the death rate was 9.2 per cent.

Lower mortality was also recorded for many other communicable causes. For the following diseases, decreases in mortality have been evident in almost every year during the past decade and continued in 1946; typhoid and paratyphoid fever, scarlet fever, diphtheria, dysentery, malaria, syphilis, rheumatic fever, pellagra, and diarrhea, enteritis, and ulceration of the intestines. For cerebrospinal meningitis, 1943 and 1944 had been relatively high mortality years, but decreases were recorded in both 1945 and 1946. The mortality rate for measles increased sharply in 1946 from the extremely low rate for 1945, but the 1946 rate for this cause was still lower than that for 1944. Mortality from poliomyelitis and polioencephalitis (acute), which has been at a relatively high level beginning with 1943, increased again in 1946.

Mortality from motor-vehicle accidents, which has been increasing since the cessation of wartime driving controls in 1944, rose again in 1946. There were 33,411 deaths from this cause, and the rate of 23.9 was 12.2 per cent higher than that for 1945. On the other hand, the mortality rate for all other accidents (46.2) was 10.1 per cent lower than that for the previous year.

Suicide and homicide had been declining during the pre-war and war years but increased sharply in the last year of the war, 1945. In 1946, the national homicide rate again showed a large increase of 12.5 per cent. The rate for suicide in 1946 increased by 2.7 per cent, a much smaller relative rise than that of 12 per cent in 1945.

MATERNAL AND INFANT MORTALITY

Particularly encouraging was the continuation, during 1946, of the declines in maternal and infant mortality. The number of deaths from diseases of pregnancy, childbirth, and the puerperium decreased from 5,668 in 1945 to 5,153 in 1946. This large relative decrease (9.1 per cent) occurred despite the unprecedented increase in the number of births during that year. The maternal mortality rate for 1946 is 1.6 per 1,000 live births (see Table A), 24 per cent lower than the rate for the previous year (2.1) and one-half the rate of five years ago (3.2 in 1941). The estimated infant mortality rate for 1946 is 33.8 deaths per 1,000 live births. This rate represents a sharp decrease of 11.7 per cent from the corresponding rate of 38.3 for 1945. Despite this large decrease in rate, the number of deaths during the first year of life increased by over 6,000 deaths from 1945 to 1946, owing to the increase in the number of births mentioned above.

SIXTH REVISION OF THE INTERNATIONAL LISTS OF DISEASES AND CAUSES OF DEATH

An international conference probably will be held in the spring of 1948 to revise the International Lists of Diseases and Causes of Death. A great deal of work has already been carried out by an Expert Committee for the Preparation of the Sixth Decennial Revision of the International Lists of Diseases and Causes of Death of the Interim Commission of the World Health Organization. The proposal that this Expert Committee has developed is far more extensive than that of any previous decennial revision since it involves the international acceptance of a list and classification which will serve the purposes of both morbidity statistics and mortality statistics. It is also more definitive since it includes a tabular list of inclusion terms as well as an alphabetical index of medical terms. The Expert Committee has had two meetings, the first to prepare the list and the second to consider revisions and suggestions obtained from the various national governments to which the preliminary work was sent.

MARRIAGE AND DIVORCE STATISTICS

Central registers of marriage records are maintained in the state health departments of 31 states and in the Office of the Secretary of State of one state; and central registers of divorce records, in the health departments of 24 states. In the remaining states, statistics of marriage and divorce can be obtained only by special surveys conducted at the local level.

The only official national statistics of marriages and divorces in the United States are composite or estimated, largely because of the difficulty of obtaining adequate statistics under the present limited operating program. Their importance lies in the fact that they serve to indicate broad national trends. Furthermore, the statistics are restricted to enumerations of numbers of marriages and divorces occurring. No detailed data in these two

[1] Excludes marriages of members of armed forces overseas.

[2] Includes reported annulments.

[3] Excludes stillbirths and deaths among armed forces overseas.

[4] Based on population present in the area, including armed forces.

[5] United States rate based on total population, including armed forces overseas. State rates based on civilian population present in the area.

[6] Estimated.

[7] Marriage licenses issued.

[8] Under laws of South Carolina, no divorces may be granted. Figures on annulments not available.

— Data not available.

important fields are available at the national level.

A provisional total of 2,285,539 marriages in the United States was recorded in 1946, and an estimated total of 613,000 divorces (see Table C). Marriage and divorce rates per 1,000 population were 16.3 and 4.3, respectively (see Table A). These were the highest totals and rates on record for the United States for any one year. Revised figures for 1945 were 1,603,139 marriages and 494,000 divorces with respective rates of 12.1 and 3.5 per 1,000 population.

Total marriages increased 42.6 per cent in 1946 over 1945, while divorces increased 24.5 per cent during the same period. The percentage increase in marriages was about four times as great as in 1945 over 1944 when a rise of 10.4 per cent was recorded, while the increase in divorces was only slightly above the 23.2 per cent recorded in 1945 over 1944.

No data on marriages and divorces in 1947 are available as yet. However, provisional figures on marriage licenses issued in the United States during the first nine months of 1947 indicate that the trend in marriages is downward from the 1946 level, but remains well above the 1945 level.

During January-September 1947, a total of 1,526,809 marriage licenses was issued in the United States, a decrease of 13.4 per cent from a total of 1,762,288 issued in the same months in 1946 but an increase of 34.9 per cent over a total of 1,131,982 issued in the same period in 1945.

A breakdown of marriages by occurrence in the four major geographic regions—Northeastern, North Central, South, and West—for 1945-1946 indicates that in general the marriage trend by region followed the pattern observed for the country as a whole in that statistics for all regions reflected successive rises in 1945-1946. However, there was considerable variation between regions in marriage rates and total figures for these years. No estimates of divorces by region have been made because of significant gaps in data and the diverse factors affecting divorce statistics by state, and, hence, by region.

In 1946, marriage rates per 1,000 population were recorded by region from highest to lowest in the order named: South, West, North Central, and Northeastern, with respective rates of 19.6, 18.4, 15, and 13.1. When

TABLE D

NUMBER OF DEATHS AND CRUDE DEATH RATES, 1946; CRUDE DEATH RATES, SELECTED YEARS; FOR SELECTED CAUSES: DEATH-REGISTRATION STATES[1]

(Exclusive of stillbirths. Rates per 100,000 estimated midyear population. Numbers after causes of death are those of the detailed International List of Causes of Death, 1938 revision)

---

[1] Death-registration states include the entire continental United States, beginning with 1933.
[2] Excludes armed forces overseas.
[3] Excludes aneurysm of the aorta for 1920 and includes "Aneurysm (except of heart)" for 193
[4] Excludes cancer of the pancreas.
[5] Excludes diseases of the coronary arteries.
[6] Includes ulcer of the duodenum.
[7] Excludes automobile collisions with trains and streetcars, and motorcycle accidents.
[8] Includes legal executions.

marriage totals were compared, however, the regional pattern shifted in certain important respects. The South reported the largest number of marriages (849,807) as well as the highest rate. The West, however, dropped from second highest with respect to the marriage rate to the lowest number of marriages for any region (323,239); and the North Central and Northeastern regions moved up to second and third with respective marriage totals of 626,955 and 485,538.

The same general changes were observed for 1945 when marriage rates and total marriages occurring were compared by region.

Thus, it may be inferred that during 1945-1946 a smaller proportion of the population married in the more populous regions of the North than in the South and West.

LIFE TABLES

The pamphlet "United States Abridged Life Tables—1945," issued as Vital Statistics—Special Reports, Selected Studies, Volume 23, Number 11, presents abridged life tables for the continental United States by race and sex. From these tables, it has been estimated that the average duration of life (expectation of life at birth) in the United States, based solely on 1945 mortality, was 65.8 years, or 2.2 years longer than it was found to be on the basis of 1939-1941 mortality (the latest data available for comparison). Comparison of similar data for each of the four race-sex groups in the United States shows that there was marked variation between these groups in the increase in the average length of life over this period. Thus, while this increment amounted to only 1.6 years for white males and 2.2 years for white females, it was 3.8 years for nonwhite males and 4.1 years for nonwhite females. However, even though the increment was considerably larger for nonwhites, their average length of life and their survival rates in 1945 still lagged far below those for whites. Similarly, the average duration of life, as well as the number of survivors to every age, continued to be higher for females when compared to the corresponding male group of each racial category.

Because of the considerable effect that the decrease in infant mortality between 1939-1941 and 1945 exerted

TABLE E

COMPARISON OF SELECTED LIFE TABLE VALUES: 1936-1941 AND 1945

	White				Nonwhite			
	Male		Female		Male		Female	
	1939–1941	1945	1939–1941	1945	1939–1941	1945	1939–1941	1945
Average remaining lifetime (in years):								
At birth	62.81	64.4	67.29	69.5	52.33	56.1	55.51	59.6
At age 1	64.98	66.1	68.93	70.8	56.05	58.8	58.47	61.8
Proportion alive at beginning of age interval dying during interval:								
5–10	.0058	.0050	.0044	.0035	.0079	.0055	.0067	.0051
20–25	.0114	.0095	.0080	.0061	.0313	.0241	.0287	.0216
40–45	.0299	.0275	.0210	.0178	.0730	.0606	.0639	.0502
55–60	.0980	.0938	.0653	.0569	.1607	.1444	.1448	.1245
Survivors out of 100,000 live births:								
To age 20	92,293	93,595	93,984	95,196	86,770	90,040	88,505	91,573
To age 65	58,305	60,580	68,701	72,532	35,912	41,856	40,718	47,824
Survivors to age 65 out of 100,000 alive at age 20:	63,174	64,726	73,099	76,192	41,388	46,486	46,006	52,225

on the expectation of life at birth, the improvement in the expectation of life at subsequent ages is significantly less, in each race-sex group, than at birth. Nevertheless, even at age five the expectation of life declined between 1939-1941 and 1945 by amounts ranging between one and three years for the various subdivisions. The continued improvement in the expectation of life at this and later ages is evidence of decline in the rate of dying in childhood, early adult life, and at the older ages.

INTERNATIONAL VITAL STATISTICS CO-OPERATION

Consultation services in vital statistics were carried on in Paraguay, Bolivia, Panama, Cuba, and Guatemala during the year. This is part of the International Vital Statistics Co-operative Program which is one segment of the Department of State Program for Co-operation with the American Republics. In addition to the work of the consultants, a number of students came from Latin-American countries to the United States during the year, receiving both academic and in-service training. The countries represented in this part of the program were Ecuador, Guatemala, El Salvador, Honduras, Bolivia, Nicaragua, Cuba, and the Dominican Republic.

This program involves the detailing of technical experts to the American Republics to act as consultants in vital statistics and public health statistics, and the awarding of intern training grants to selected officials of the American Republics to enable them to study vital statistics organization and administration in the United States and related public health statistics. It is designed to improve and standardize the vital statistics systems of the American Republics in accordance with resolutions adopted by a number of recent Pan American Conferences, especially the resolutions of the Eleventh Pan American Sanitary Conference held in Rio de Janeiro during 1942.

As a rule, the initial work of the consultants detailed to the foreign countries includes the preparation, under the supervision of the proper foreign government officials, of detailed studies regarding: (1) existing organization and methods for birth and death reporting; (2) procedures and operations of the statistical tabulation services concerned with vital statistics; (3) methods and procedures for medical record-keeping and resulting statistical activities of hospitals and other medical service institutions; and (4) government uses and requirements for public health statistics and vital statistics. Upon the basis of the studies conducted, plans and procedures are formulated with regard to vital statistics and related public health statistics, including organization, processing of records, coding and tabulation requirements, designing of forms, and the preparation of instruction manuals. If, after considering the studies and resulting plans and procedures formulated, the appropriate officials of the foreign government desire to proceed with the program of work, the consultant remains in the country as a technical consultant to assist in the development of the program.

The trainees from the American Republics observe and study vital statistics organization and administration under the supervision of officials of the National Office of Vital Statistics. Their program of work, which extends over a nine to 12 months' period, includes: (1) specialized study in an accredited university; (2) study and practical work in the National Office of Vital Statistics; (3) observation and study of organization, methods and procedures in state and local offices of vital statistics; (4) training in morbidity and hospital statistics; and (5) training in population census methods and procedures.

DIVISION XXIV

PSYCHOLOGY, PHILOSOPHY, ANTHROPOLOGY

PSYCHOLOGY

By Wilbur S. Hulin
Professor, Pacific University

GENERAL

Trends.—W. Dennis has edited a series of essays, called *Current Trends in Psychology* (Univ. of Pittsburgh), including such general topics as "Experimental Psychology," "Psychotherapy," and "Animal Psychology." *The Place of Psychology in an Ideal University* (Harvard Univ.), by a Harvard University commission under the chairmanship of A. Gregg, presents a candid recommendation that the subject be taught with an emphasis on the individual rather than upon abstract principles.

Texts.—New general books include those by F. L. Ruch, *Psychology and Life* (third edition; Scott Foresman), with additional chapters on Psychotherapy, World Peace; R. S. Woodworth and D. G. Marquis, fifth edition of *Psychology* (Holt); E. Dichter, *The Psychology of Everyday Living* (Barnes & Noble); C. E. M. Joad, *How Our Minds Work* (Philos. Lib.); M. Sherman, *Psychology for Nurses* (Longmans, Green); R. A. Davis, *Educational Psychology* (McGraw-Hill), which depends greatly upon experimental and classroom observation.

Popular Beliefs.—H. P. Longstaff has compared pseudo-psychological beliefs of college students in 1923 with those of 1947, and learns that present students reduce their belief in telepathy from 60 per cent to 7 per cent; phrenology from 25 per cent to 0 per cent; physiognomy from 55 per cent to 3 per cent (*J. Appl. Psych.*, Feb.).

Testing.—*Psychological Testing* (Longmans, Green), by J. L. Mursell, uses 100 standardized tests to illustrate the principles exemplified. L. E. Tyler, in *The Psychology of Human Differences* (Appleton-Century), supplements the essential statistical concepts with concrete examples from various test methods.

Theory.—Consciousness as physiological functioning is organismic in nature, says W. W. Martin; the basis is in the primary metabolism of protoplasm; it is the "syncytium" of the physico-chemical processes (*Psych. Rev.*, March). M. Sherif and H. Cantril, in *The Psychology of Ego-Involvements* (Wiley), expound the serial re-formations of the ego at different stages in life. W. Köhler has completely rewritten his *Gestalt Psychology* (Liveright); the various formulations of configurationism have been phrased in more intelligible language.

PERSONALITY

Total View.—G. Murphy's *Personality* (Harper) assumes a biosocial approach; wholeness, group membership, and culture are stressed. H. H. Anderson *et al* continue their *Studies of Teachers' Classroom Personalities* (Stanford Univ.), presenting follow-ups of the effects of dominative and integrative contacts on children's behavior. *Effective Personality Build-*

ing (McGraw-Hill), by G. R. Vaughn and C. R. Roth, offers the results of test and follow-up materials for five years on college students; the individual rather than traits is treated; the viewpoint is that of a student planning a business career.

Criteria.—C. R. Rogers urges that, in the clinical approach, the client's perceptual field should be used as the basis of understanding his personality (*Amer. Psychologist*, Sept.). A. Ellis has compared the direct and the indirect phrasing of personality questionnaires and has found no difference in the responses of problem groups of subjects as compared with the non-problem groups (*Psych. Monogs.*, No. 284). N. Stewart believes that the preferences of literary characters is a valid indication of personality traits, although a complete standardized test based upon this criterion alone would be difficult (*Amer. Psychologist*, Aug.). S. S. Tomkins has, from his first-hand clinical experience, assembled a complete historical account of the *Thematic Apperception Test* (Grune & Stratton) which is a current method of analyzing personality traits. The typical personality of the Hopi Indians is influenced by social pressure of the white race in the direction of compulsive neurosis where the ceremonial life is repressed: L. Thompson and A. Joseph (*Amer. J. Sociol.*, July).

Rorschach.—*The Rorschach Exchange and Journal of Projective Techniques* is the official organ of the Rorschach Institute, Inc., Chicago; it is a source of news regarding the projective methods of studying psychological problems induced by stress, brain injury, heart disease, and drug addiction. M. L. N. Northway and B. T. Wigdor show significant relationships between certain characteristic responses of the Rorschach test and the socio-economic status of school children; the unaccepted group show more of the so-called schizophrenic symptoms, while the highly accepted children show more of the psychoneurotic symptoms (*Sociom.*, May).

ABNORMAL

Texts.—*Abnormal Psychology* (McGraw-Hill), by J. D. Page, is a general text which discusses such recent movements as group therapy, hypnoanalysis, and shock therapy. W. C. Menninger's *Psychiatry in a Troubled World* (Macmillan) includes a discussion of international mental hygiene. L. E. Hinsie's *Understandable Psychiatry* (Macmillan) seeks to create a partner relationship between patient and physician. H. A. Carroll offers a *Mental Hygiene* (Prentice-Hall).

Programs.—Psychiatry in the Veterans Administration program recorded 70,000 neuropsychiatric disabilities in the Second World War; now it is recognized that most illnesses carry with them psychiatric implications, therefore in the present medical rehabilitation program the 13,000,000 veterans of the Second World War are receiving closely integrated mental care for all those who need medical attention: P. R. Hawley (*Amer. J. Psychiat.*, July). L. F. Shaffer declares: "The major problem in psychotherapy is its improvement through research. Schools and doctrines, conceived primarily to persuade and to teach, are unlikely to supply us with the basis of this improvement" (*Amer. Psychologist*, Nov.).

Therapy.—E. Klemperer recommends a pleasant and soothing type of hypnotherapy for patients who suffer chronic anxiety due to pathological organic conditions, such as lack of oxygen consumption (*J. Nerv. & Ment. Dis.*, Aug.). Withdrawal of morphine from an addict seldom causes a psychosis unless the patient has a previous history of insanity which may become intensified, advises A. Z. Pfeffer (*Arch. Neurol. & Psychiat.*, Aug.). A critical assessment of the process of beneficial substitute activities, called *Sublimation* (Macmillan), has been brought together by J. T. Davies.

Defectives.—W. Sloan and R. A. Cutts analyzed the performance of 700 mental defectives on the Stanford-Binet Scale and found that the typically difficult tests were those involving verbal ability and abstractions, and the easy tests were those dealing with concrete objects and involving rote memory (*Amer. J. Ment. Defic.,* Jan.).

SENSATION

Color.—W. D. Wright's *Researches on Normal and Defective Color Vision* (Mosby) is a balanced and complete summary of the present knowledge of color vision. The Ishihara color blind test is useful in detecting color weak persons who are receiving vocational guidance; C. E. Jurgensen has prepared a helpful table for the quick scoring of the test (*J. Appl. Psych.,* Feb.). Cebus monkeys seem to be red blind according to R. B. Malmo and W. F. Grether (*J. Comp. & Physiol. Psych.,* June).

Visual Development.—An important experimental study of the year came from the Yale University Primate Laboratory concerning the visual discrimination of chimpanzees which had been reared in darkness for the first 20 months of their life; when tested for vision through conditioning with shock to large yellow and black striped discs the developing of discrimination was very slow as compared with normal animals; discrimination of color and size came first, and discrimination of line and form came later: A. H. Riesen (*Amer. Psychologist,* Aug.). The detection of flicker by humans becomes less acute with increasing age, but no sex differences were ascertained by H. Misiak (*J. Exper. Psych.,* Aug.).

Perception.—R. K. Luneberg's *Mathematical Analysis of Binocular Vision* (Princeton Univ.) is a significant approach to the non-Euclidean geometry of visual depth. Commercial instruments for testing visual acuity, depth perception, and phorias have been found by R. J. Wherry to be sometimes better and sometimes worse than standard ophthalmological devices, and consequently all new devices should be given a rigorous psychophysical calibration before their value is accepted (*Amer. Psychologist,* Aug.). The perception of direction of a tilted straight line, measured by the observer's placing a dot beyond the judged extension of the line, can be radically altered by the field factors which are introduced: A. D. Salomon (*Amer. J. Psych.,* Jan.). W. Köhler has extended his work on figural aftereffect to include the third dimension (*ibid.,* Apr.).

Auditory Acuity.—H. Davis *et al* have published an experimental study of *Hearing Aids* (Harvard Univ.) showing the relative affectiveness of various designs of amplification. Speech hearing furnishes a useful test of auditory acuity in children; the children point to pictures corresponding to spoken words by a high fidelity phonograph record: L. Meyerson (*Amer. Psychologist,* Aug.).

Thresholds.—Sensitivity for intensity of sound is finer for binaural than for monaural hearing, according to W. A. Shaw *et al* (*J. Exper. Psych.,* June). J. M. Doughty and W. R. Garner report that very brief tones, *e.g.,* five-thousandths of a second, sound like clicks with no pitch characteristic; the pitch threshold arrives sooner with higher tones up to 500 v.s. (*ibid.,* Aug.).

Other Senses.—A detailed inventory of the sensations from muscles, tendons, and joints, experienced while piloting an airplane, is listed by E. H. Carnes (*Contact,* May). The aftereffects of cold sensations, aroused by punctiform stimulation, continue for as much as 60 seconds, as observed by trained subjects: N. B. Hall and K. M. Dallenbach (*Amer. J. Psych.,* April). A dirhinnic olfactory stimulator with readily changeable nose pieces for every stimulus and every subject has been designed by D. Foster *et al* (*ibid.*). The sense of taste in fishes is anatomically distinct from the chemical sense, according to E. Scharrer *et al* (*J. Comp. Neurol.,* March).

AFFECTIVE

Emotion.—Fear in aerial combat was counteracted by high motivation until the after-effects were felt at which time a typical neurotic state was commonly experienced: L. F. Shaffer (*J. Consult. Psych.,* May). *Don't Be Afraid* (Wilcox & Follett) is the title of a book by E. S. Cowles. S. Tenenbaum explains *Why Men Hate* (Beechurst). A book on psychodrama, called *The Theatre of Spontaneity* (Beacon House), by J. L. Moreno, the originator of the method, details with charts and action diagrams the analytic procedure intended. M. B. Arnold asserts that emotion is primarily a positive excitation of the thalamus and hypothalamus rather than a release from cortical inhibition (*Amer. Psychologist,* Aug.).

Pleasantness.—H. N. Peters and F. T. Rogers experimentally show that the feeling of pleasantness does not need an accompanying positive response toward the source of the feeling, but only a positive attitude toward the object (*J. Exper. Psych.,* Feb.).

Aesthetics.—In *Painting and Personality* (Univ. of Chicago), R. H. Alschuler and L. W. Hattwick report a study of 150 children between two and four years of age, observed daily, some for more than two years, in their original work with art materials; the meaningfulness of different media was noted; the main psychological evidence concerned a conflict between infantile dependency and developing self-assertiveness. C. E. Seashore opens new avenues of approach to the psychology of music in his book, *In Search of Beauty in Music* (Ronald). R. Arnheim calls art appreciation a process of perceptual abstraction, as illustrated by the detached art expressions of psychotics (*Psych. Rev.,* March). Use of the term, "psychic distance," is reviewed by L. D. Longmaan from the date of its origin in 1912 by Bullouch to its recent extension by Bell to include only a knowledge of form and depth (*J. Aesth. & Art. Crit.,* Sept.). R. Seddon describes two modes of perception and expression performed by artists when painting; one is a compromise between the sense impression of the original object and the sense impressions of the medium employed as the artistic product is being executed; the other is the expression of a mental concept with little modification by the medium employed (*ibid.*).

INTELLIGENCE

Levels.—Biographical *Studies in Genius* (Philos. Lib.) are offered by W. G. Bowerman. E. A. Doll distinguishes feeble-mindedness from intellectual retardation by means of an assortment of tests including those of motor proficiency and social competence from which mere maladjustment can be differentiated from real deficiency (*Amer. J. Ment. Defic.,* Jan.). M. L. Hutt has an "adaptive" method of applying the Revised Stanford-Binet test to poorly adjusted subjects in order to obtain a more valid I.Q. than by the routine "continuous" method (*J. Consult. Psych.,* March).

Measurement.—L. L. Thurstone presents a development and expansion of his statistical treatment of the "vectors of the mind" in his *Multiple-Factor Analysis* (Univ. of Chicago). Oral testing permits an examiner to judge a subject's manner, poise, diction, modulation, group attitude, tact, cooperativeness, leadership, and organizational approach: W. Brody and N. J. Powell (*Educ. & Psych. Meas.,* Summer). R. S. Ellis, in a thorough examination of the measurements of relative variability of mental traits, concludes that many "laws" and generalizations by different writers are not verifiable; many functions are really the sums of simpler functions; changes in the rate of development are correlated with growth and decline; the sexes are more constant in those traits in which each is superior (*Psych. Bull.,* Jan.). D. Simrall finds small correlation between intelligence test scores and the ability to learn (*J. Psych.,* Jan.).

Higher Processes.—F. L. Wells obtained high correlation between a Physical Science Motivations test and ability in quantitative thinking, and between a Sensitive Affect test (or social motivation) and verbal types of thinking; thus the verbal-quantitative dichotomy is significant for determining an individual's aptitudes (*ibid.*). A general increase in the ability to think in both verbal and mathematical terms during the years of college is shown by the results of the American Council on Education Psychological Examination; an average rise of 28 percentile points was found by L. Florence (*J. Educ. Psych.*, Feb.). On the other hand, A. L. Assum and S. J. Levy find little correlation between a college freshman psychology examination and the senior comprehensive examination (taken four years later); students judged to be adjusted to college life reveal as a group better achievement in their academic work (*ibid.*, May). N. Bayley brings to bewildered parents a comforting discovery in her conclusion: "As recorded in test scores, the course of intellectual growth in each child is unique, presenting an over-all pattern of development which rarely parallels the average for more than two years" (*Amer. Psychologist*, Aug.).

LEARNING

Seven Forms.—*The Nature and Conditions of Learning* (Prentice-Hall), by H. L. Kingsley, is organized in terms of seven forms of learning: motor skills, perception, memory, comprehension, solving, emotions, and attitudes. Suggestions for the instruction of first grade pupils are offered in J. J. Loftus' book, *Helping Our Young Children to Learn* (New York Bd. Educ.). H. M. Robinson explains *Why Children Fail in Reading* (Univ. of Chicago). In an examination of the process of "learning to talk," M. Schmideberg points to the relationship of talking with the child's ego-libido, and suggests that sublimations of the ego are revealed in the language habits of the individual during growth (*Psychoanal. Rev.*, July). In a Roundtable discussion of "learning as a psychosomatic problem," S. H. Bartley cites instances in which elementary sensations of seeing are determined by one's personal background of visual experience; E. M. Coles states that the incidence of reading disability by several members of a family indicates a somatic basis of this type of learning (*Amer. J. Orthopsychiat.*, July).

Training.—According to E. B. Jackson, discipline, "in its fine original sense," means the same thing as learning and teaching; it develops from the combined influence of motivation and guidance (*ibid.*, Oct.). In an attempt to condition "spinal" dogs, W. N. Kellogg *et al* decided that the slight changes in the reflexes employed were due to a "sensitization" of the response rather than true conditioning (*J. Exper. Psych.*, Apr.). When recent memories obliterate earlier ones (retroactive inhibition), a new measure in terms of longer verbal reaction-times was noted by L. Postman and H. L. Kaplan (*ibid.*).

PHYSIOLOGICAL

Texts.—The outstanding text of the year is J. R. Kantor's *Problems of Physiological Psychology* (Principia). A new periodical, *The Journal of Neurological Sciences*, edited by L. J. Pollock, has appeared. S. H. Bartley and E. Chute have rendered a significant service in delineating the relation between *Fatigue and Impairment in Man* (McGraw-Hill); the book deals with the facts of sleep, long endured strain, visual performance, and chronic syndromes.

Shock.—Two hundred cases of electroshock therapy showed after five years that 80 per cent of the patients maintained a high degree of recovery: N. K. Rickles (*Amer. J. Psychiat.*, July). E. B. Tietz reports social recovery in 21 out of 46 patients who submitted to at least 12 treatments of "electronarcosis" in which electrodes placed above the mastoid region carried an alternating current of about 125 m.a. for 12 to 30 minutes; the initial shock must be about 200 m.a. (which stops respiration), then within 30 seconds drops to 70 m.a. for 90 seconds, then increases to 125 m.a.; the range between inhibition of breathing and narcosis must be delicately gauged (*J. Nerv. & Ment. Dis.*, Aug.).

Brain.—K. U. Smith describes cases of bilateral integrative action of the human cortex in verbal associations as determined in subjects suffering from certain brain lesions; the results indicate dynamic relationships between areas of the brain, rather than fixed association pathways (*J. Exper. Psych.*, Oct.). T. C. Barnes suggests that good emotional adjustment is found in subjects who give stable electroencephalographic records with deep breathing (*Amer. Psychologist*, Aug.).

Heredity.—In a symposium on the distinctions between heredity and environment, L. Carmichael infers from a study of prenatal sensory development that human nature may be "nine-tenths inborn"; W. S. Hunter points out that man's great variability in behavior obscures the amount of basic inherited patterning that exists (*Psych. Rev.*, Nov.).

Organismic.—When animals are exposed to prolonged stresses, such as hunger, temperature extremes, fear, burns, or surgical interference, an adaptive process is set up by hormones in the pituitary gland which produce changes in both the nervous system and the viscera; when this process is exhausted death follows: B. F. Riess (*Amer. Psychologist*, Aug.). When rats, as infants, are frustrated in feeding they exhibit in adulthood greater tendencies to hoard and to gorge when further frustration of feeding occurs (*J. Comp. & Physiol. Psych.*, Oct.). G. H. Parker reviews 30 years of research on *Animal Color Changes* (Macmillan).

CHILD

Books.—E. Harms edits a *Handbook of Child Guidance* (Child Care) presenting the information needed by the physician, the psychiatrist, the psychologist, and the social worker. Continuing their 25-year follow-up on 1,400 superior children, L. M. Terman and M. H. Oden present a study called *The Gifted Child Grows Up* (Stanford Univ.).

Expression.—The contribution of self-expression and initiative in producing the human individuality is pictured at several age levels by V. Lowenfeld in *Creative and Mental Growth* (Macmillan). The July issue of *The Nervous Child* is devoted to a group of papers on "ego-development" and "ego-deviation"; for example, R. Dreikurs describes four goals of the maladjusted child, namely, to gain attention, to gain power, to get even, and to give up. V. Maxline's *Play Therapy* (Houghton Mifflin) aids parents in the intelligent guidance of children's self-expression.

Environment.—Comparisons between sociometric status and personal problems (such as acceptance by schoolmates) of adolescents indicate that the unaccepted youths have greater restraint and frustration in their home background: R. G. Kuhlen and H. S. Bretsch (*Sociom.*, May). H. L. Goldberg describes *Child Offenders* (Grune & Stratton) he has known in his work as case supervisor in New York City. C. A. Aldrich claims that a pediatrician's understanding of childhood personality must begin with a study of newborn babies who reveal chartable characteristics which can be followed through later environmental modifications (*Amer. J. Orthopsychiat.*, Oct.).

SOCIAL

General.—*Readings in Social Psychology* (Holt), sponsored by the Society for the Psychological Study of Social Issues, includes condensations of books as well as original articles. G. W. Allport complains: "Addiction to machines, rats, or infants leads us to overplay those features of human behavior that are peripheral, signal-oriented, or genetic. Correspondingly, it causes us to underplay those features that are central, future-oriented, symbolic." As a result, the psychologist has not created ideal models for moral conduct (*Psych. Rev.*, July). H. W. Odum's *Understanding Society* (Macmillan) gives a careful treatment of concepts of regionalism and technicways.

Morality.—A timely *Handbook of Correctional Psychology* (Philos. Lib.) has been compiled by R. M. Linder and R. V. Seliger. Racial frames of reference affect moral judgments, and the racial influences should be taken into account in counseling, cautions M. Seeman (*Amer. Sociol. Rev.*, Aug.). T. Parsons includes among the primary sources and patterns of aggression in the social structure of the western world such psychological motives as institutionalization of adolescent values, perceived in the attack upon symbols, and also in the "father-son" type of relationship which produces conflict between solidarity groups (*Psychiat.*, May). W. K. Layton outlines a means by which the techniques of school counseling can be used in the out-of-school community (*Educ. & Psych. Meas.*, Spring).

Opinion.—G. W. Allport and J. Postman, in *Psychology of Rumor* (Holt), summarize the laboratory tests of rumor circulation, distortion, elaboration, and consequent effect on society. Trends in public opinion from 1944 to 1946, derived by the Psychological Corporation's Index of Public Opinion, yield "barometric" changes in America's attitudes on such national issues as war with Russia (on which the affirmative opinion has increased from 43 per cent to 74 per cent: H. C. Link (*J. Appl. Psych.*, Apr.).

Popularity.—In a study of popularity in college, J. W. Reilly and F. P. Robinson found that location in a dormitory, *e.g.*, near to or remote from a popular student, does not influence another's popularity (*Educ. & Psych. Meas.*, Summer). Leadership criteria, as based on tests of 222 boy scouts, were labeled "helpfulness," "serious interest": A. C. VanDusen (*Amer. Psychologist*, Aug.).

INDUSTRIAL

Efficiency.—*Work and Effort* (Ronald), by T. A. Ryan, rounds up the research literature on fatigue, aptitude, and incentive in various industrial jobs. F. B. Davis reports on current employment accomplishments in his monograph, *Utilizing Human Talent* (Amer. Counc. Educ.). D. B. Dill reveals a psychological effect on industrial workers who were administered what were represented to be vitamin pills but were not; 71 per cent of these workers reported gains in health and vitality; compared with these, 77 per cent who were administered real vitamin pills reported gains in health and energy (*Proc. Amer. Philos. Soc.*, Aug.). Visual aids, such as "work simplification blocks," and "job training charts," greatly accelerate the training programs of workers: E. S. Howard (*Factory Manag. & Mainten.*, Oct.).

Personnel.—J. Kaplan has edited *The Encyclopedia of Vocational Guidance* (Philos. Lib.) which gives a wide range of information on the validity and reliability of existing tests, types of advisement for various jobs, and a survey of vocational trends. *New Methods in Applied Psychology* (Univ. of Maryland), by G. A. Kelly, introduces the contributions devised by the military psychologists during the war. A series of papers on improving human relations in industry includes an article by A. H. Leighton on the "applied science of human relations" involving techniques of developing a common purpose cultivated by formal organization or informal organization, such as the grapevine (*Personn. Admin.*, July). Consulting psychologists must acquire techniques of good working relationships with employees in order that the psychological techniques of personnel management be successfully applied: B. J. Covner (*Amer. Psychologist*, Aug.); the counselor must keep in mind the inertia or slowness of all human beings in accepting new ideas (idem, *J. Consult Psych.*, Sept.).

PHILOSOPHY

By Ledger Wood
Associate Professor, Princeton University

PHILOSOPHY AND THE PRESENT CULTURAL CRISIS

The pattern of post-war philosophy in America was further clarified during 1947. The philosophy of the past two or three years can not yet be seen in proper historical perspective, and it would be rash indeed to attempt to predict the shape of things to come in American philosophy. Nevertheless, a number of trends have emerged in the philosophy of the recent past which may be described as historical vectors, pointing toward probable future developments. Perhaps the most significant and encouraging feature of the contemporary scene in American philosophy is the philosopher's urgent sense of his responsibility in the present crisis of Western culture. The philosopher is acutely aware that philosophical ideologies have, in the past, contributed to world conflict and that the primary obligation of philosophy in the present political and social crises is to promote intercultural understanding.

This task, however, can be performed only in the light of an adequate understanding of the ethical and philosophical foundations of our democratic institutions as unfolded in the historical development of the American philosophical tradition. The philosopher has not, however, permitted his sense of responsibility in a cultural crisis to interfere with the pursuit of his distinctively philosophical enquiries as a disinterested seeker after truth. Technical investigations in the fields of metaphysics, logic and semantics, and theory of knowledge, far from having been neglected, have been carried on with intensified vigor in the appreciation that philosophic world-views have, in the past, played a decisive role in determining the course of world history and that survival of our culture may depend in part on the character of our metaphysical commitments. The vitality of philosophical speculation in the present crisis of our social, cultural and political institutions strikingly illustrates Hegel's famous remark in *The Philosophy of Right:* "The owl of Minerva takes its flight only when the shades of night are gathering."

THE AMERICAN PHILOSOPHICAL TRADITION

American philosophers feel a justifiable pride in the richness of our philosophical heritage and the influence which it has exerted in the molding of our democratic institutions, and they realize that American democratic ideals can be defended against alien ideologies only by understanding these ideals in the context of the American philosophical tradition. Professor Herbert W. Schneider's *A History of American Philosophy* (Columbia University Press) eloquently illustrates the theme that philosophical thought in America has never been divorced from social consciousness and social action. Though he does not attempt to read into the history of American thought a "central content, dominant note, or moral lesson," his survey testifies to a pervading sense among American philosophers of the relevance of philosophy to the problems and issues of our democratic society. After a brief survey of The Colonial Period, the author considers in Part II, "The American Enlightenment" and observes that "Never in America were philosophical thinking and social action more closely joined . . . than during this period." In Part III, "Nationalism and Democracy," the reader encounters many relatively unknown figures of the early nineteenth century who represent liberal, utilitarian tendencies in social and political philosophy. The author contends that the "American bourgeois socialism" of this era is "indigenous and not merely an extension of European movements" (p. 207). Professor Schneider in Part IV, "Orthodoxy," and in Part V, "The Transcendental Temper" discusses Emerson, Thoreau, and Alcott and, in addition, revives a number of unfamiliar thinkers of orthodox religion and of transcendentalism. Part VI, "Evolutionism and Human Nature," traces naturalistic tendencies in American thought from John Fisk to William Graham Sumner, E. A. Robinson and George Santayana. Josiah Royce and other American philosophers in the idealistic tradition are discussed in Part VII. The book culminates in Part VIII, "Radical Empiricism," in an account of the development of the pragmatic movement; the teachings of William James' pragmatism and John Dewey's instrumentalism are adequately and sympathetically presented in their psychological context and in their social and educational ramifications. C. S. Peirce, Justice Holmes, T. V. Smith, A. C. Barnes, and other figures associated with the pragmatic movement are also discussed. The chief significance of the book as a whole, and of this part especially, is its wealth of illustration of the theme that American philosophers have rarely neglected the social, political, religious, and humanistic import of their doctrines.

ONE HUNDRED YEARS OF AMERICAN PHILOSOPHY

The *Philosophical Review,* in its July issue (Vol. LVI, 4), inaugurated a new policy of "devoting occasional numbers to symposia on special topics currently of concern to philosophers . . ." The first of these symposia, consisting of papers read at the meeting of the Western Division of the American Philosophical Association at the University of Iowa, May 10, 1947, was devoted to a critical appraisal of the past one hundred years of American philosophy.

Prof. Herbert W. Schneider opened the symposium with a paper on "A Century of Romantic Imagination in America," in which he briefly characterized three forms of romanticism. (1) "Romantic social philosophy and philosophy of history." Professor Schneider interprets the history of American socialism as "a chapter in the history of Romanticism"; he contends that "socialism was for a generation either the ideology of small cooperative communities . . ., or the ideology of the universal spiritual fraternity of mankind . . ." and that "the most popular ideology . . . was the romantic theory of the social Gospel, the coming of the Kingdom of God" (p. 354). (2) "Romantic psychological empiricism." The second variety of romanticism which is psychological in its sources is "an exploration of the sub- and superconscious"; "a century ago this form of romanticism took a wild religious turn —spiritualism . . ." Many of the features of this earlier psychological romanticism are preserved in the psychology of William James. (3) "Romantic metaphysics." The third type of romanticism attains its fullest expression in the metaphysical idealism of Josiah Royce, which Professor Schneider characterizes as "unrealism." Royce gave this form of romanticism its classic formulation when he declared "the impossibility short of absolute experience of uniting the world of description and the world of appreciation . . ."

Prof. Max H. Fisch in his paper, "Evolutionism in American Philosophy," sketches the impact of evolutionism on American thought from early American Darwinism to Dewey (pp. 357-373).

Prof. Arthur E. Murphy, in his article, "Ideals and Ideologies, 1917-1947" (pp. 374-389) undertakes a historical study of selected philosophical ideas of the recent past. This study is intended "not as a preview of what future generations may write about our recent past from the standpoint of a present we cannot share, but as an estimate now for those who have lived through it . . ." Murphy restricts his attention to "the climate of opinion and habits of thought of the period concerning the nature, function, and validity of the ideals by reference to which men normally explain or justify their conduct . . ." Widely as the new realism, pragmatism, personalism, and temporalism of this period diverged from one another, they agreed that the function of philosophical enquiry is "the free and critical examination of the basic assumptions on 'first principles' of morality, religion, science and common sense." "The rediscovery of the efficacy and 'social reality' of ideals as ideologies was an event of major philosophical importance. It carried with it the recognition that the ideals or 'myths' that define the concensus of belief or valuation within any society do make a difference and sometimes a decisive difference in its social behavior." Outside academic circles, the two dominant philosophical doctrines of the period were Marxism and Scholasticism. Murphy shrewdly observes that "What has not been sufficiently noticed is the important respect in which they were in agreement—*viz.* their ideological absolutism."

Prof. Edgar S. Brightman's article, entitled "Philosophy in the United States, 1939-1945," which was prepared "at the request of the American Council of Learned Societies, partly for the information of scholars in other countries," concludes the symposium. It contains a valuable summary of the progress of research during the war period and lists important publications under the headings: History of Philosophy, American Thought, Theoretical Ethics, Aesthetics, Epistemology, Metaphysics, Theory of Value, and Philosophy of Religion. The list, though not intended as an exhaustive bibliography, is an exceedingly useful guide to the philosophical literature of the war period.

PHILOSOPHY AND THE HUMANITIES IN THE CENTURY AHEAD

The Princeton University Bicentennial Conference on "The Humanistic Tradition in the Century Ahead" gave prominence to the role of philosophy in the development of the humanistic tradition and sought to project its future role in the century ahead. Participating in the conference were distinguished European and American philosophers, including George H. Sabine, George Boas, Charles W. Hendel, Werner W. Jaeger, Irwin Edman, Arthur O. Lovejoy, Salvador De Madariaga, Richard P. McKeon, Stephen C. Pepper, I. A. Richards and Theodore M. Greene.

Prof. Donald A. Stauffer in summarizing the conference in a pamphlet published by Princeton University says: . . . "the speakers themselves were in the process of creating new ideas through a kind of reaction in intellectual chemistry, and of giving rich complexity to such old words as 'freedom,' 'democracy,' 'responsibility,' 'synthesis,' 'value,' 'choice,' 'historicity,' 'transcendent,' 'organic,' 'humanistic'—yes, and perhaps to even the most mysterious word of all: 'man.'"

Pepper, a spokesman for philosophic humanism, maintained that a method which, like the Hegelian, seeks to comprehend the whole of life in a single system or theory of organic unity was not truly humanistic; the true humanist accepts all evidence however diverse, rather than impose or assume organic unity. Lovejoy advocated the inclusion in the college program of a course in philosophical anthropology, taught with the philosophy department as center, which should concern itself with the question: "What is man, and what is the matter with him?"

Professor Stauffer's summary of the conference lists the following points which represented the opinions of the majority of the members of the conference: (1) "Nationalism is today the great enemy of humanism since frontiers mutilate or compartmentalize the human spirit, (2) Humanism implies action as well as contemplation, (3) humanism fosters freedom, (4) . . . the humanistic tradition does not foster anarchy, though it respects the individual, it is aware of society, (5) Humanists today are middlemen in a complex democracy."

MAN AND HIS MYTHS

The spirit of humanism pervading the earlier philosophical writings of the late Prof. Ernst Cassirer is reaffirmed in his posthumously published work, *The Myth of the State* (Yale University Press). Professor Cassirer, although he came to America late in his brilliant scholarly career, displayed a profound and sympathetic understanding of democratic ideals and institutions. He appraised the values of the democratic way of life in the setting of the humanistic tradition and sharply defined the basic issues between democracy and that arch-enemy of humanism—Nazi totalitarianism. Professor Cassirer's humanism proposed as the defining trait of man his exercise of the symbolic function in language, art, science, religion, and other "symbolic forms." He replaced the Aristotelian definition of man as "the rational animal" with the conception of man as "the symbol-making animal," a definition which differentiates man from the lower animals as sharply as the Aristotelian.

Among the symbolic functions of man, myth-making is one of the most characteristic and significant. In the first part of *The Myth of the State,* entitled "What Is Myth," Cassirer reformulated his theory of myth as a symbolic form; "myth," he says, "is the art of expressing, and that means organizing [man's] most deeply rooted instincts, his hopes and his fears" (p. 49). In Part II, "The Struggle Against Myth in the History of Political Theory," he traces historically the attempt "to see the whole of human nature in an ethical rather than in a mythical light" (p. 60). Part III, "The Myth of the Twentieth Century" deals with the revival of myth in support of racism and the totalitarian state. "The powers of myth were checked and subdued by superior forces. As long as these forces, intellectual, ethical and artistic are in full strength, myth is tamed and subdued. But once they lose their strength, chaos is come again." (p. 298) Professor Cassirer traces the evils of the Nazi political philosophy to a perversion of the myth-making function of man; the racial and political myths of the Nazis were among their most effective propagandistic weapons. The author at times overstates his case against the political myth in seeming to suggest that the political myth is inevitably a sinister influence in human culture and society. In harmony with his basic definition of the myth in the political sphere, he could very properly have maintained that myths are dangerous only when they are the weapons of an immoral, political group, but have a legitimate function even in a Christian and democratic social order.

Man Against Myth (Little, Brown) is the arresting title of a brilliantly written essay by Prof. Barrows Dunham, which defines myth in radically different terms from Cassirer's book: the myth as defined by Cassirer, is largely an *imaginative* construction; the myths combated by Dunham are errors of the *intellect* similar to the Baconian "idols." His book is a devastating attack on the following prevalent and influential myths of present-day America: that you can not change human nature; that the rich are fit and the poor unfit; that there are superior and inferior races; that there are two sides to every question; that thinking makes it so; that you can not mix art and politics; that you have to look out for yourself; that all problems are merely verbal; that words will never hurt me; that you can not be free and safe. The destruction of each of these "idols" of modern man, though in part factual, is also philosophical; Dunham subscribes to the thesis that philosophy is the proper antidote of myth.

THE NATURE OF MAN

A Panel Discussion of the topic, "The Nature of Man," was a feature of the Forty-Third Annual Meeting of the Eastern Division of the American Philosophical Association, held at Yale University, Dec. 26-28, 1946. A great diversity of shades of philosophical opinion was represented in the four papers, the abstracts of which appeared in *The Journal of Philosophy* (Vol. XLIII, 25).

The naturalistic interpretation of man was defended by Prof. Abraham Edel: "The materialist-naturalist tradition contends that to view man as part of nature brings enrichment of quality and enhancement of value, for it encourages attention to causal conditions whose control alone can make men free." Professor Edel admits that "Mechanical materialism at certain stages carried the values of power, individual success, self-aggrandizement, and theoretically it came to favor ethical relativism," but he argues that "a mature materialist-naturalist outlook no longer interprets its ethical concepts reductively . . . The socio-historical necessities of a given period, *e.g.* global peace today, are capable of supplying criteria which give special structure to the moral field and a scientifically objective basis to moral inquiry. A materialist-naturalist ethic, so far from being committed to arbitrary relativism, provides a firm ground for an all-human ethic, including a deepened democratic outlook and a cosmic vision."

At the opposite extreme, Prof. Paul Tillich developed the philosophical foundations and implications of a theological humanism. Professor Brand Blanchard adopts a moderate, idealistic position which recognizes that man lives on "a hierarchy of levels." "As a body, he obeys the laws of physics. As a body alive, he obeys the laws of biology. As a conscious being, he obeys the laws governing the association of ideas. He is also, though brokenly, a moral and rational being." Prof. Lewis M. Hammond, in the spirit of Leibnizian compromise, suggest that ". . . each of the different views of the nature of man reflects some partial aspect of his nature."

Nature and Man, by Prof. Paul Weiss (Holt), is not, as the title might suggest, an essay in naturalistic metaphysics. It does, indeed, consider man's place in physical nature, but its conception of man and his freedom is far closer to traditional idealism than to reductive naturalism. "What is needed today," says Weiss, "is a philosophy which is adequate to all aspects of existence and thus has room to assert that man is both natural and free" (p. xv). Weiss' delineation of the task of philosophy is reminiscent of Platonic eternalism: "Philosophy speaks of the permanent and essential in undeniable ways, to provide a revelation of the nature of things, holding everywhere and always" (p. xviii). Weiss' ambitious project could well be described in Kantian language as the investigation of the metaphysical foundations of ethics. In the first part, entitled "Causation and Freedom," the reality of freedom and its ultimate compatibility with natural causation are affirmed. He resolves the antimony of freedom by asserting that, though free activity is creative and unpredictable, once it has occurred, it can be viewed retrospectively as necessary and inevitable. In the second part of the book entitled, "The Psyche and the Self," he describes the unfolding of human selfhood and differentiates creative processes of the human self from the conscious and occasionally intelligent activities of animals. The activities of the self, though "expressed in and through the body . . . may be expressed as a mind and as a will" (p. 241). Thus "the self is a self of a natural yet ethical man" (p. 252). The ultimate ethical import of the entire book is epitomized in these words: "A man, because he is responsible, owes it to himself to plumb the foundations of ethics and make evident to himself what he ought to be" (p. 267).

SIGNS, LANGUAGE, AND HUMAN BEHAVIOR

Prof. Charles Morris' *Signs, Language and Behavior* is a systematic attempt within the framework of behavioristic psychology to formulate a philosophical theory of the function of signs, including linguistic signs. Professor Morris' sophisticated version of behaviorism is a far cry from crude Watsonian behaviorism, yet it preserves certain of the most characteristic features of the earlier version. Morris, like Watson before him, seeks to exclude from psychology all explicit reference to thought, consciousness and other "mentalistic" processes and to restrict psychology to the observation and measurement of gross reactions of organism. Watson's theory of language as implicit or subvocal speech, established by a conditioning process, is transformed by Morris into a highly refined theory of signs as dispositions to respond in characteristic ways. But many of the old familiar concepts of Watsonian behaviorism are recognized in their formal dress in the new science of "semiotic."

Semiotic is the general theory of signs and of sign-using behavior. Its aim is to provide "a set of terms to talk about signs taking account of current distinctions but attempting to reduce for scientific purposes their vagueness and ambiguity" (p. 4). In the detailed elaboration of the science of semiotic, Morris first defines such elements of the sign-situation as "interpreter," "sign," "referent" in behavioral terms, and then distinguishes the various types of signs behaviorally. The informative, valuative, incitive, and systematic functions of signs are carefully differentiated, and language is assimilated to semiotic by construing it as a system of signs having relatively constant signification for different users and capable of entering into combination to form more complex signs. Professor Morris' subtle and detailed analysis of the constituents of sign-situations and his elaborate classification of the functions of signs may prove semantically and linguistically valid even though the behavioristic substructure of his theory may be untenable.

Morris' theory of signs, in spite of its behavioristic basis, is not without its humanistic significance. He interprets religious discourse in terms of the prescriptive and incitive functions of signs; science in terms of designative and informative; while poetry is primarily valuative. Philosophy itself is a criticism and systematization of beliefs, differing from science, art, and religion in "the comprehensiveness of the system of beliefs which it presents to us for adoption." Nor does Morris ignore the educational significance of the theory of signs; "an education which gave due place to semiotic would destroy at its foundations the cleavage and opposition of science and the humanities" (p. 246).

The contrast between Morris' behavioristic semiotic and Cassirer's philosophy of symbolic forms (referred to in the section on "Man and His Myths" above) is illuminating. The latter theory, in the tradition of classical idealism, interprets symbols as distinctively mental and human; the former theory, which is in the naturalistic tradition, interprets signs behaviorally and endeavors to establish a continuity between the crude signs which function in animal behavior and the complex signs employed in the scientific and philosophic activities of man. Morris and Cassirer are at opposite poles psychologically and philosophically, yet they are both convinced of the centrality of symbolism and linguistics in the understanding of man's social, political, and cultural activities. Perhaps, in spite of their terminological and philosophical divergences, the insights and analyses of semiotics and the theory of symbolic forms are mutually translatable. In any case, the convergence of the naturalistic and idealistic traditions on issues relating to the nature of symbols and their function in human discourse, is an encouraging trend in contemporary philosophy.

ANTHROPOLOGY AND ETHNOLOGY

By Marian W. Smith
Department of Anthropology, Columbia University

AREA STUDY

Scientific trends may be slow in developing, but once underway they often show surprisingly rapid results. A significant anthropological shift toward work in Asia and related areas, and toward community studies of national or local groups both in this hemisphere and abroad, occurred during the war years. Anthropology was by no means alone in this interest which was coupled with a growing realization on the part of all of the various social sciences that adequate studies of the modern world called for cooperative work. Apparently simple problems in the field of any one of the social sciences were apt to lead directly to some sister science or discipline. As the subject matters of the social sciences come under better control, the need for cross-disciplinary researches becomes more pressing. Persons trained in world areas beyond the boundary lines of Europe and America were pitifully few in number. World area programs which had been of value in training war personnel were continued. Others were initiated and world area study has now become one of the most important developments in the field of higher education.

During 1947, the universities intensified their interest in area study both on the graduate and undergraduate levels, and the national foundations were most generous in their support of such study. Latin America study centers have been in existence for some time and institutes for area study now exist in various stages of development in many of the large universities: Far Eastern Studies, Cornell; Near East, Princeton; Southeast Asia and the Pacific, Yale and Stanford; China, University of Washington, Harvard, and Yale; Japan, University of Michigan; India, University of Pennsylvania; Russia, Columbia, Harvard, and Syracuse. A survey of areal programs was made by Robert B. Hall and published in May as Pamphlet 3 of the Social Science Research Council under the title *Area Studies: with special reference to their implications for research in the social sciences.*

Funds for study and for research in Asian and European areas will be made available under the Fulbright Act (Public Law 584-79th Congress), which amends the Surplus Property Act of 1944. The promise of adequate financial backing has stimulated plans for research in these areas and various attempts have been made to prevent duplication of effort and haphazard planning. The National Research Council, Division of Anthropology and Psychology, set up a Committee on Asian Anthropology under the chairmanship of Lauriston Sharp. The first National Conference on the Study of World Areas, sponsored by the Committee on World Area Research of the Social Science Research Council, was held at Columbia University Nov. 28-30. Area panels covered Latin America, Europe, Soviet Union, Near East, Southeast Asia and India (later changed to Southern Asia), and the Far East. Important as teaching programs in the institutes may be, members of the conference were unanimous in their feeling that priority should be given to research in the areas. The conference also concluded that area work should supplement but not replace the older and basic training in the several social sciences and in the humanities.

FIELD WORK IN ETHNOLOGY

Field work in ethnology involves what may be termed incipient area study but it has too often been limited to the efforts of one or, at best, two persons. Although many plans for area study in Asia were underway, actual work during the year was rather limited. Cornelius Osgood of Yale University spent some time in Korea, and Morton Fried started a Chinese community study under the auspices of the Social Science Research Council. Dorothy Spencer remained in India. The largest single effort still remained the United States Strategic Bombing Survey of Japan. Further work in Japan has been made practically impossible by the occupation.

RESEARCH PROGRAM IN MICRONESIA

One of the most comprehensive research programs yet attempted got underway in Micronesia. The Pacific Science Board of the National Research Council heads up the program which includes 44 anthropologists from 22 institutions. Funds are being provided by the Office of Naval Research, the Viking Fund, and participating institutions. Forty persons are still in the islands or have already returned from field work there. The so-called CIMA or Coordinated Investigation of Micronesian Anthropology is an outgrowth of the recommendations made by the Pacific Science Conference, June 1946, and is the first research program sponsored by the Pacific Science Board. George Murdock is scientific coordinator.

RESEARCH IN CONTEMPORARY CULTURES

A second major research project began in 1947 under the direction of Ruth Benedict at Columbia University. It is a study of certain groups of European and Asiatic origin in New York City with priority given to French, Czechoslovakians, Jews, Russians, and Chinese. The project, Research in Contemporary Cultures, is financed under the Social Science program of the Medical Sciences Branch of the Navy. Margaret Mead, Conrad Arensberg, Ruth Bunzel, Geoffrey Gorer and David Rodnick are anthropologists supervising the research which is being carried on with the cooperation of psychologists, psychiatrists, political scientists, and other social scientists. The project has a field office at 411 East 69th Street, New York.

FIELD WORK IN LATIN AMERICA

Field work in Latin America has reached a new stage. Much work is being done both in ethnology and archaeology by regional personnel, some of whom have been trained in anthropology in the United States. Mexico and Brazil are leaders in this gratifying development. The Smithsonian Institute of Social Anthropology under George Foster has direction of several projects which also include local personnel; Donald Pierson is working with students from the Escola Livre de Sociologia e Politica of Sao Paulo among so-called Caboclo communities; J. H. Rowe began work in collaboration with the Institute Etnologico among the Guambiana Indians near Popayan; Isabel Kelly has charge of ethnological research in Tajin, near Papantla; and A. Holmberg and F. W. McBryde studied the social anthropology of the Viru Valley, Peru as projected in that area several years ago.

Members of other institutions have also continued ethnological field work. Alfred Metraux spent time in various parts of Latin America in connection with plans for UNESCO. Norman McQuown left to gather material on the Huastec language. Oscar Lewis spent the summer in the Mexican village of Tepoztlan in which he worked previously, and N. D. Humphrey of Wayne University continued his work in Tecolotlan, Jalisco. Morris Siegel and Marguerite King led students from the University of Puerto Rico in a study of Naranjito, P. R. An extensive Puerto Rican program, sponsored by the University of Puerto Rico for inquiry into problems of human biology and cultural anthropology, also got underway. Dean Antonio J. Colorado of the University, Clarence Senior of the Social Science Research

Center, University of Puerto Rico, and Harry Shapiro formulated the project, and it is now being carried forward with the help of Columbia University and the American Museum of Natural History. A. E. Rojas, formerly of the University of Chicago, has assumed direction of a four-year ethnological-sociological survey of the Papaloapan River Valley.

ETHNOLOGICAL EXPEDITIONS

The University of California, Berkeley, has an expedition in South Africa. Researches on early man are being carried out in the Makapan Caves under the direction of Charles L. Camp, paleontologist, and E. M. Loeb as a member of the expedition is making an ethnological study of Ovambo and of a Bushman group. Richard Slobodin finished work in the vicinity of Fort McPherson on the Mackenzie River where he was a fellow of the Arctic Institute. Edward H. Spicer continued studies among the Yaqui, interrupted by the war, and also worked on a community study of Potam, Sonara. B. W. Aginsky, director of the Social Science Field Laboratory, reactivated summer research of the laboratory among the Pomo of California. The present problem concerns "Intercultural Relations of Indians and Whites."

Gordon Brown did preliminary work on a research project which he will direct on diet, food habits, and allied sociological problems among the Crees of northern Ontario. The project is being handled by an inter-university committee and is financed jointly by the Dominion Government and the Canadian Life Insurance Officers' Association. Work among North American Indians has by no means decreased and numerous elaborate projects are in the planning stage.

FIELD WORK IN ARCHAEOLOGY

The major single activity in archaeology was performed by the Committee for the Recovery of Archaeological Remains of the American Anthropological Association. Frederick Johnson of this committee, after working with officials of the National Park Service, the Bureau of Reclamation, and the Smithsonian Institution, testified before the Senate Committee on Appropriations and was instrumental in the restoration of funds previously cut from the Missouri Basin appropriation by the House of Representatives. This and other appropriations later passed the Senate so that work started in 1946 in survey and excavation of areas to be flooded was continued.

Field projects in archaeology were numerous and were limited as usual to the Americas. Excavations in other parts of the world remain largely in the hands of classical archaeologists or of local men. Ties between archaeologists in the classical and anthropological traditions in this country have been strengthened during recent years and this trend continued in 1947. The Syrian Expedition of the Oriental Institute, University of Chicago, began a field season in the Near East with an eye toward establishing early village sites of the Syrian coastal strip. The purpose of the expedition is to add to our knowledge of the beginnings of settled, agricultural economies, and it serves to emphasize the similarity of problems now interesting both anthropologists and classical archaeologists.

The Department of Anthropology of the University of Arizona and the Arizona State Museum jointly inaugurated a long-range archaeological study at Point of Pines in the eastern part of the San Carlos Indian Reservation. An archaeological field school was established in connection with this work, and students from Columbia University participated in the first field session. Twenty-five students will eventually be accommodated. The school is directed by Emil W. Haury and E. B. Sayles. The Museum of New Mexico also had a large group in the field excavating prehistoric Indian sites under the leadership of Paul S. Martin. The Southwest Museum, with the cooperation of kindred southern California museums, organized the "Southern California Archaeological Survey Association" for mapping, recording data about, and assembling representative collections from sites between the Pacific Coast and the Colorado River, between Bakersfield and Lower California. R. F. Heizer of the University of California, Berkeley, led a graduate student trip in a series of archaeological investigations in California. One of these is to be continued and completed with the collaboration of the Department of Anthropology of the University of California at Los Angeles. L. S. Cressman started work on the Klamath Indian Reservation as a further step in the investigation of Oregon prehistory. The program will continue for at least three more years.

The Division of Historical Research, Carnegie Institution, under A. V. Kidder, carried on excavations in the western Guatemalan highlands and on the Pacific slope of Guatemala. A party at work at the ruins of Bonampak in Chiapas made a startling discovery of Old Empire Maya wall-paintings found in unusually good preservation. D. F. R. de la Borbolla, M. Covarrubias, and H. de Terra, working on a Viking Fund project in Mexico, have likewise made striking finds of apparently early date which may change present ideas of the archaic cultures.

Numerous other individuals and groups were in the field doing archaeological work. These may be conveniently located in the yearly survey made by *American Antiquity* and need not be repeated in detail here.

ORGANIZATION, MEETINGS, ETC.

The first post-war meeting of the 28th Congress of Americanists was held in Paris, Aug. 24-31. The International Congress of Anthropology and Ethnology scheduled for Prague in August was cancelled. An International Folklore Congress met in Paris July 12-13, and the International African Institute sponsored a conference on African Anthropological and Linguistic Research in London July 2-4. An International Institute of Archaeo-culture (Institut International d'Archeocivilisation) was founded in Paris April 16. J. M. Carriére, president of the American Folklore Society, is a member of the Interim Committee.

The American Anthropological Association held its annual meeting Dec. 28-30 in Albuquerque, N. M. Ruth Benedict gave the Presidential address emphasizing the place of the methods of the humanities in anthropological research, and the President *pro tem,* Clyde Kluckhohn, commented. Robert H. Lowie was awarded the Viking medal and annual prize of $1,000. Two new branches, a Hawaiian and a Western Branch were added to the Association. The Central States Branch and the Society for American Archaeology held a joint meeting at the University of Michigan May 16-17. The American Association for the Advancement of Science, Section H (anthropology), held its largest meeting of many years in connection with the 114th meeting of the Association in Chicago Dec. 27-31. Joint sessions were held with the Linguistic Society of America and the Society for Child Development. The Linguistic Society of America held a summer meeting at the University of Michigan Aug. 1-2 and its annual meeting at Yale in December. The Archaeological Institute of America also met in New Haven Dec. 29-31.

The Linguistic Circle of New York held monthly meetings as did many local groups. The Chaco Canyon Conference met July 28-30, and the Third Conference on Iroquois Research met at Alleghany State Park, New York, Oct. 24-26. The American Folklore Society met with the Society of Modern Languages at Detroit during the Christmas holidays. The School of American Research, the Museum of New Mexico, and the Laboratory of Anthropology met Sept. 4-5 and effected the consolidation of the three institutions.

PUBLICATIONS

The American Ethnological Society explored the possibility of a new journal to be devoted to cross-disciplinary studies but the active members of the committee, Robert Merton, George Murdock, Talcott Parsons and Marian W. Smith, decided to suspend activity until the new journal *Human Relations* had demonstrated its coverage of the field. The Society also sponsored the first Student Conference in Anthropology in May at the American Museum of Natural History. The American Anthropological Association inaugurated a mimeographed *News Bulletin* which is sent to fellows of the Association. Plans are well underway for a *Handbook of Middle America* which will parallel the classic *Handbook of Indians of North America* and the more recent *Handbook of South America*. H. B. Collins, Jr., was made anthropological consultant and advisor for the *Encyclopedia of the Arctic* being edited by Vilahjalmar Stefansson. David Mandelbaum is editing a memorial volume in honor of the late Edward Sapir, and on Oct. 9, the ninety-fifth anniversary of the death of John Lloyd Stevens, a plaque was unveiled in his memory at Marble Cemetery in New York City. Stevens was one of the first great American anthropologists.

LINGUISTICS

Language study received great impetus during the war and now shows no sign of abating. Extensive language programs are integrated with most of the area studies mentioned above; the innovation of using informants in teaching modern languages has now become firmly established; and personnel trained in various Asian and Near East languages has increased. Indiana University inaugurated a comprehensive East European program under the direction of Carl Voegelin in the study of the Finno-Ugric languages, and Thomas A. Sebeok, who is connected with the program, did research in Finno-Ugrics in Europe as a fellow of the American Scandinavian Foundation. Bjorn Collinder of Upsala, Sweden, was visiting scholar at Indiana for 1947-1948 as part of this program.

Special studies emphasized again the two major interests of linguists in language as (1) a formal and discrete phenomenon and (2) one aspect of total human activity. The Linguistic Society of America and Section H of the American Association for the Advancement of Science gave a joint program on Linguistics and Culture organized by Charles Hockett. The University of Oklahoma announced a new program of undergraduate and graduate courses, leading to the M. A. degree in linguistics, under the direction of George L. Trager. Gladys Reichard was on sabbatical leave the latter part of the year and devoted her time to her long-time study of Navaho. Morris Swadesh continued, as Guggenheim fellow, his study of the language and culture of the Nootka of Vancouver Island, Canada. Non-experts will find a useful illustration of joint linguistic and cultural material in Clyde Kluckhohn's book on the Navaho published by the Harvard Press.

PHYSICAL ANTHROPOLOGY

The second *Yearbook of Physical Anthropology*, published by the Viking Fund and distributed with the *American Journal of Physical Anthropology*, contains a survey of the year's literature in this field.

The year witnessed increased activity in two directions: toward detailed anatomical studies which throw light on general problems and which, therefore, tend to bring anatomists and physical anthropologists together; and toward more interest on the part of general anthropologists in the special field of fossil man. The last few years have seen important finds in this field, and several significant hypotheses have also been advanced. Perhaps the most far-reaching of these has been Franz Weidenreich's reconstructions of *gigantopithecus*. This hypothecated evolutionary form was the subject of extensive criticism at both of the major anthropological meetings during the year. Both Wilson D. Wallis in his presidential address at the dinner of Section H of the American Association for the Advancement of Science, and Verne F. Ray in a paper before the general session of the American Anthropological Association, questioned the validity of the hypothesis as posited. Quite apart from the pros and cons of the case, nothing in recent years has served more heavily to underscore the essential unity of anthropology in this country than these criticisms of a physical anthropologist by persons often identified with purely social anthropology. Despite differences of subject matter in the branches of anthropology, the aims and methods of the science remain essentially the same.

Scientifically sound, and non-racist, materials on racial classifications and race relations continued to be emphasized in all teaching, yet new research projects in this field were apparently few. The University of Chicago created a committee on a five-year program of education, training, and research in race relations, directed by Louis Wirth. Otto Klineberg returned from two years in Brazil where he made a special study of race relations. Margaret Wyant worked with a Chinese informant from Hawaii on the same subject and extended her study into an appraisal of the general field. But the main development has been into what is generally called intercultural study. Intercultural work, with special emphasis upon race relations, is widely expanded today through the agency of various social work groups and of teaching training groups. The basic facts of racial equality are known and now need mainly a wide and accurate dissemination.

CULTURE AND HUMAN RIGHTS

Cultural differences between national and regional groups are fully as well documented as racial equality. They are equally important to world affairs, and the position of cultural relativism is being actively espoused by many anthropologists. A "Statement on Human Rights" reflecting this position was drawn up by Melville Herskovits for the Executive Board of the American Anthropological Association and submitted to the commission on Human Rights, United Nations. The statement was also published in the *American Anthropologist.* Criticism of ethnocentric value judgments and behavior continues strong in anthropological thinking. Standards devised for general application in the world of today must constantly consider this factor. There is great danger that well-meaning but ethnocentric leaders may demand useless, even destructive, social changes in the name of conformity, and the facts concerning today's tremendous, and legitimate, cultural variation therefore need as full a dissemination as do the facts of basic racial equality.

On the other hand, anthropologists also raise the possibility of the existence of cross-cultural values. "Live and let live" must be the practical answer to present problems, and such a position is scientifically valid. Certainly most general programs for world peace are conceived with belief in one way of life uppermost and are, consequently, both scientifically and practically unsound. Yet the attention of some is now turning toward the eventual possibility of establishing valid world programs. The need for such programs is easy to recognize but difficult to realize. Interest in the theory of culture was demonstrated by a number of articles in 1947; discussions at meetings revolved around theory; and knowledge of local differentiation in Asia, Europe, and the Americas is accumulating. There is every indication that, during the next decade, anthropology will turn more and more of its research energies toward an evaluation of cultural relativism and cultural differentiation.

PART SEVEN
THE HUMANITIES

DIVISION XXV

LITERATURE AND LANGUAGE

FICTION

By Amy Loveman

Associate Editor, *Saturday Review of Literature*

POST-WAR FICTIONAL PATTERN

By 1920, two years after the end of the First World War, Sinclair Lewis had published *Main Street* (Harcourt, Brace) and Scott Fitzgerald *This Side of Paradise* (Scribner), and American fiction had started to blaze a trail which led, on the one hand, to the era of disillusionment with the United States and, on the other, to the "new freedom" for the younger generation. For the first time in its history, literature in this country cut entirely loose from the optimism and complacency which had marked its general course and took on an urgency and heat which, for the time being, rendered pallid all that was being produced in the traditional vein. Now, two years after the end of the Second World War, fiction has earnestness but not fire, a sense of responsibility without the dynamic quality that makes it an impulsive force, discontent, perhaps, without crusading zeal.

It was inevitable, of course, that the pattern should alter with the march of events. The generation that was young in the twenties tore the veil that hid the cankers of their society from before the eyes of their countrymen and what they did then insured that their sons should not suffer the same shattering of the American dream as had they. And their struggle against the taboos, the conventions, and the hypocrisies of Victorian culture led to a disregard of established codes of behavior which gave literature license to deal with topics long under the ban. The young generation of today, heirs of their fathers' victories and children of depression, wear no blinkers and have their freedom, but they lack one thing their fathers had, the, alas unwarranted, confidence that war had made the world safe for democracy and the passionate determination to build a world in which war should not again be possible on a large scale. The writers of the present have come out of the recent struggle, like all their fellows, fearful, confused, appalled by the problems and the antagonisms of peace. They have no tranquillity in which to recollect emotion, which may, perhaps to an extent, account for the fact that they are producing no books of lasting consequence. The fiction of 1947, however, if not striking, earnest, and sincere, is concerned with matters of social import, serious in its attack upon the ills that beset the body politic.

THE RACIAL ISSUE

The problem of race prejudice, forced upon the attention of the world by the Nazi persecutions, has been of paramount importance. Anti-semitism, especially, has come in for discussion, with a book like Laura Hobson's *Gentleman's Agreement* (Simon & Schuster) unexpectedly topping the best-seller lists and winning a second enormous public in its motion picture version. Mrs. Hobson attacks not the ignorant or admittedly biased anti-semite but the intelligent, well-to-do individual who regards himself as a liberal and free from prejudice and who yet, by condoning anti-semitism among his associates, is lending countenance to its continuance. Wallace Stegner, in his novelette *Second Growth* (Houghton Mifflin), a tale playing in a dull New Hampshire town where the presence of an ardent young Jewish couple upsets summer residents and natives alike, Norman Katkov's affecting *Eagle at My Eyes* (Doubleday), Meyer Levin's *My Father's House* (Viking), which carries the reader over to Palestine, all deal with the theme of anti-semitism.

The problem of the Negro's relationship to the white community has also occupied many of the novelists. Opinion has varied widely as to the validity of Sinclair Lewis' thesis in *Kingsblood Royal* (Random House), a tale whose hero, a successful Midwestern lawyer, having discovered that he has a strain of Negro blood in his veins, throws overboard success and the esteem of the white community to become part of the Negro world, and though the book has been widely read it has been vigorously attacked by critics professional and otherwise. Like Lewis's book dealing with the problem of the Negro and the prejudice against him are Chester Hines' *Lonely Crusade* (Knopf), concerned not only with racial prejudice but also with sex and politics, and Worth Tuttle Hadden's *The Other Room* (Crown).

Significantly enough, though Willard Motley is himself a Negro, no inkling of the fact enters into his powerful *Knock on Any Door* (Appleton Century). Here is one of the most effective social documents of recent fiction, a study of juvenile delinquency, crime, and reform schools which can not but recall, in its passionate intensity, though there is no resemblance between the art of the two, the Dickens of *Nicholas Nickleby* and *Oliver Twist*. It is particularly heartening to see Motley writing, not as a Negro novelist, but merely as an American writer. Another social document, highly charged with grimness, is Natalie Anderson Scott's *The Story of Mrs. Murphy* (Dutton), the story of a young man, well-intentioned enough but too weak to resist his fondness for drink, and of the respectable Irish family on whom he brings sorrow and disgrace. Miss Scott writes with remarkable knowledge of the milieu she describes and with compassion, despite her relentless picture of the degradation to which her hero descends. A novel, loudly hailed by an intellectual few, Malcolm Lowry's *Under the Volcano* (Reynal & Hitchcock), is again a portrayal of an alcoholic but this time one developing with subtle strokes the sickness and agony of soul of a small group gathered together under the Mexican sun. A book likely to be caviar to the general, it has been pronounced by some of the critics the finest novel of the year.

NOVELS SHADOWED BY WAR

The war, though as conflict it played a small part in the fiction of 1947, yet was an important activating agent in many of the novels. This was the case in David Davidson's *The Steeper Cliff* (Random House), which took for hero an army lieutenant and which was in substance a study of cowardice; Robert McLaughlin's *The Side of the Angels* (Knopf), balancing the good and the bad in the United States army at war, and, incidentally, introducing the Jewish question; Lionel Shapiro's *The Sealed Verdict* (Doubleday), a highly interesting book built about the trials in Germany and depicting the struggles of mind and conscience of a young American officer who, having secured a verdict against a Nazi offender, began to doubt the correctness of the evidence on which it was based; *The Gallery* (Harper), by John Horne Burns, with G.I.'s for personnel and Naples for scene; the vivid and revealing *Tales of the South Pacific* (Macmillan), by James Michener; *The Victory* (Random House), by Vincent McHugh, and *Command Decision* (Little, Brown), by William Wister Haines, a story of air strife over Germany. Not of the war, but of the unsettled conditions born of the war, is Maritta Wolff's *About Lyddy Thomas* (Random House), with its depiction of the smash-up of a middle-class marriage and the general confusion and turmoil of mind of a group of factory workers in a Midwestern town. Miss Wolff's book is a picture of how youth lives, as is also C. W. Grafton's *My Name Is Christopher Nagel* (Rinehart).

THE HISTORICAL NOVEL

The historical novel still flourishes in the country as the green bay tree. Such tales range all the way in time from Vardis Fisher's *Adam and the Serpent* (Vanguard), the latest novel in the series designed to show the march of mankind, which takes for its subject the struggle for supremacy between men and women at the dawn of humanity, and Konrad Bercovici's *The Exodus* (Beechhurst), presenting a legend based on the Biblical story of Moses and the exodus of the Jews from Egypt, to Berry Fleming's *The Lightwood Tree* (Harcourt, Brace) which presents concurrently a satire on political conditions in Georgia today and scenes from the past history of the state. From the point of view of popularity the most successful historical novel of the year was Thomas Costain's *The Moneyman* (Doubleday), a story of the period of Charles VII of France, with the merchant and financier, Jacques Coeur, for hero and the King's mistress, Agnes Sorel, playing a part in the plot. Highly popular also was Samuel Shellabarger's *Prince of Foxes* (Little, Brown) in which Caesar Borgia moves against a carefully developed background of Renaissance politics. Borgia appears again in Maurice Samuel's *The Web of Lucifer* (Knopf), a vivid and realistic picture of a man and a period. In *The Heretics* (Harcourt, Brace), Humphrey Slater takes for his theme the persistence of bigotry and prejudice, playing out a double thread in a story of the Children's Crusade and the Spanish Civil War.

Lion Feuchtwanger now an American citizen, has become American also by his choice of subject in *Proud Destiny* (Viking), a novel that comes close to history in the authenticity of its portrayal of Franklin and Beaumarchais and the background of Paris and Versailles. While this book has the color of fiction, it has the ring of truth. The Revolutionary period, this time with the events placed in America and not abroad, is also the subject of Edward Stanley's excellent *Thomas Forty* (Duell Sloan & Pearce), a tale of Westchester and of Tory activity there, stretching in time from Valley Forge to the end of the war. The American West and border settlement come in for vivid treatment in A. B. Guthrie's *The Big Sky* (Sloane), a lusty, vigorous, and truthful portrayal of frontier life in Kentucky and Montana in the mid-nineteenth century, full of fighting and Indians and rough-and-tumble experience, and in *The Harp of a Thousand Strings* (Morrow), by H. L. Davis, which sweeps from the Western prairies to the France of the Revolution and the Terror. In *Blood Brother* (Duell, Sloan & Pearce), Elliott Arnold spins a vivid tale of Arizona and the Indian troubles after the Mexican War, one calculated to stir Americans once again to shame at the treatment which the red man has met at their hands, while in *Paquita* (Putnam), Robert Raynolds mingles description of the Mexican revolt of the early nineteenth century with romance and politics. The Civil War, of course, continues to maintain its popularity as a subject for the novelists, with Ben Ames Williams's long *House Divided* (Houghton Mifflin) as the outstanding example of the category.

NOVELS IN LIGHT VEIN

Man can not live by bread alone and even in a world of confusion and storm there must be novels that afford escape. And such novels there will always be for the instinct for entertainment is as deep-rooted in the human breast as the desire to learn or to play a part in the affairs of men. There was a spate of tales during the year which, while they added little to permanent literature, added much to the enjoyment of the reader who was looking for an amusing yarn or a story of adventure or a nostalgic romance. Among these, several were novels of manners, like Louise Field Copper's astringent *Summer Stranger* (Harper), with its biting portrayal of a New England summer resort into which exclusive precinct a "poor relation," a girl of seventeen, had found her way; Aline Bernstein's *Miss Condon* (Knopf), full of the details of furnishing and food which give such sense of substance and permanence to the well-to-do homes of the turn of the century; Mannix Walker's amusing and extravagant tale of paying guests who retrieved the fortunes of a decaying Southern family, *The Lonely Carrot* (Dodd, Mead); Sterling North's idyll of an Indiana boyhood in 1903, *So Dear to the Heart* (Doubleday); George Milburn's *Flannigan's Folly* (Whittlesey), in which a returned veteran worked his way into sustenance and marriage; Gerald Warner Braces' *The Garretson Chronicle* (Norton), a story of a New England family which is an excellent portrayal of contrasting generations and ways, Marcia Davenport's *East Side, West Side* (Scribner), and Vincent Sheean's *A Certain Rich Man* (Random House), both of these latter depicting a New York of wealth and luxury and attempting as offset to show how "the other half" lives. There were tales of adventure like *Unseen Harbor* (Lippincott), by Frank Laskier, with its narratives of seamen ashore and afloat, Thomas Duncan's *Gus the Great* (Lippincott), not a story of adventure in the usual sense but still a picaresque tale full of stir and bustle, lively incidents, and colorful personalities, and *Ledger of Lying Dog* (Doubleday), by William George Weekly, a sort of cross between *Robinson Crusoe* and *Treasure Island*.

THE AMERICAN SCENE

The American scene, in less polished aspects than those presented in the novels of such writers as Marcia Davenport and Vincent Sheean, has engaged the interest of a number of novelists. It is a tough picture which Budd Schulberg draws in *The Harder They Fall* (Random House), an exposure of the fight racket, and a frankly ugly one which John Steinbeck presents in the much-discussed *The Wayward Bus* (Viking), the story of a group of persons marooned for the space of a storm in a bus stalled on a mountain road and reverting under the extraordinary conditions to the rawest manifestations of human nature. Satire, suave but unsparing, makes Herman Wouk's *Aurora Dawn* (Simon & Schuster) a pungent as well as entertaining depiction of high-pressure radio advertising, and satire, too, gives edge to Frederic Wakeman's caustic picture of a theatrical producer, *The Saxon Charm* (Rinehart). Politics are the target of Robert Rylee's *The Ring and the Cross* (Knopf) and Ben Appel's story set in post-Rooseveltian Washington, *But Not Yet the Slain* (Wyn). Upton Sinclair's foray into international affairs now carries his hero Lanny Budd into an eighth volume and covers Algeria, Sahara, and Germany. *Presidential Mission* (Viking), though it is set abroad, still has its bearings on the American scene.

THE PSYCHOLOGICAL NOVEL

One of the most notable trends of recent fiction has been its interest in the psychological and psychoanalytical. Undoubtedly the impulsion to this sort of tale was given by the return of the soldiers and the problems subtended by their readjustment to normal life and of those they had left behind them to themselves. Though the veteran has dropped out of sight to a considerable extent, the habit of interest in mental attitudes and reactions goes on in such novels as Nancy Wilson Ross's *The Left Hand Is the Dreamer* (Sloane), a delicately developed story of a fortunately placed young matron plunged into unwonted spiritual turmoil, Henry Morton Robinson's *The Great Snow* (Simon & Schuster), with its projection of the emotional stresses of a family group forced into isolation by a blizzard; *The Mountain Lion* (Harcourt, Brace), by Jean Stafford, a touching and tragic portrayal of a sister-brother relationship; Hilda Lewis' *Strange Story,* Hannah Lees's *The Dark Device* (Harper), and Margaret Millar's *Experiment in Springtime* (Random House). Of fantasy and the symbolic there has been comparatively little though such a book as John Steinbeck's *The Pearl* (Viking) comes close to falling in the latter category, and Robert Nathan's graceful *Mr. Whittle and the Morning Star* (Knopf), with its story of middle age yielding briefly to the glamor of youth, and Conrad Richter's *Always Young and Fair* (Knopf), the portrayal of an elderly woman's sudden resentment against her dead lover, always young and fair in memory, in mourning whom she has let life pass her by, could almost be regarded as parables.

FICTION IN ENGLAND

The blight the war cast on creative writing in England still, to a considerable extent, prevails. Conditions in the British Isles remain so stringent, the deprivations are so great, and the hardships so many that it is small wonder British writers have not recovered their resilience. The profound weariness that holds the nation in its grip is reflected in a lack of originality and vivacity in its fiction. For the most part novels follow an established pre-war pattern, with obeisance, of course, to changed conditions, or still concern themselves with the war. Some of the most effective books of the year dealt with the conflict. Such are the two books by H. S. Bates, *The Cruise of the Breadwinner* (Little, Brown), a brief but moving story of one day during which the members of a Channel patrol run the gamut of dangers and emotions and look into the face of the enemy when they rescue a German pilot from the sea, and *The Purple Plains* (Little, Brown), set in distant Burma with an airman for hero. Such, too, are Nevil Shute's *The Chequer Board* (Morrow), stories of the dying in hospital, Michael Leigh's vividly realistic tale of guerilla fighting in Russia, *Comrade Forest* (Whittlesey), and Bruce Marshall's witty, entertaining, and scathing portrayal of British military government at work, *Vespers in Vienna* (Houghton Mifflin).

NOVELS BY FAMILIAR WRITERS

Angela Thirkell's *Peace Breaks Out* (Knopf), which might be regarded as a war story in reverse, continues the author's familiar vein of depiction of English county life, but the vein, alas, is beginning to run thin. Other well-known names appear among the novelists of 1947, none of them, however, represented by the author's best work, whether it be J. B. Priestley with *Jennie Villiers* (Harper), E. H. Young with *Chatterton Square* (Harcourt, Brace), Sheila Kaye-Smith with *The Lardners and the Laurelwoods* (Harper), T. H. White with *The Elephant and the Kangaroo* (Putnam), or Gerald Kersh with *Prelude to a Certain Midnight* (Doubleday). P. G. Wodehouse has emerged from his wartime eclipse with a new tale with old characters, *Full Moon,* and the first volume of what promises to be an important novel built on a careful study of the life of the poet, Robert Burns, *The Wind That Shakes the Barley* (Macmillan), has appeared from the pen of James Burke.

TALES OF SCOTLAND AND WALES

Perhaps the most outstanding of the British novels of the year is a tale not of England but of Scotland, the full-bodied story of a family of

Victorian days which rose to wealth and influence, *Red Plush* (Farrar & Straus), by Guy McCrone. There is excellent character drawing in the book, a nice sense of perspective, and a realistic recreation of a period now rendered distant by events. Two other tales of Scotland, *The Drinking Well* (Stewart), by Neil M. Gunn, and *Friends and Lovers* (Little, Brown), by Helen MacInnes, and a grim novel with its setting in Wales, *The Dark Daughters* (Doubleday), by Rhys Davies, deserve mention.

In neither Britain nor America was there any work during the year of large importance or promise of permanence. The fiction in both countries has been marked by sobriety and earnestness and an awareness of the hour, but in England especially the writing produces the impression that for the moment at least all passion is spent. In America, where there is greater virility perhaps, there is yet nothing of the dynamic energy which lent fire to the fiction of an earlier war generation. Both countries still await the emergence of a notable post-war fiction.

CONTINENTAL NOVELS IN ENGLISH TRANSLATION

Among foreign novels of the year to which was accorded considerable critical and general acclaim mention should be made of Jean-Paul Sartre's *The Age of Reason* (Knopf) and *The Reprieve* (Knopf), both of them grim pictures of a chaotic and demoralized France, Ernst Weichert's touching *The Girl and the Ferryman* (Pilot), Louis Aragon's impressive picture of Paris after the First World War with its characteristically French love story, *Aurelien* (Duell, Sloan & Pearce), Carlo Levi's *Christ Stopped at Eboli* (Farrar & Straus), the picture of an Italian hamlet remote, ingrown, and forsaken, C. F. Ramuz's quietly dramatic *When the Mountain Fell* (Pantheon), Arnold Zweig's *The Axe of Wandsbek* (Viking), and Roger Vercel's *Madman's Memory* (Random House).

POETRY

By A. M. Sullivan
Poet and Critic

POST-WAR DRAG ON POETRY

Poetry for 1947 is still in the doldrums of a post-war period. The affirmative work of a few of the newer poets is an indication of a shift of emphasis as the young men get a perspective of the events in which they are more than innocent bystanders.

REVOLT AGAINST THE VICTORIAN AND THE ROMANTICS

There have been three minor revolts among the poets in the past generation. In 1912-13, America witnessed a revolt against manners, a protest against the Victorian hangover, a refusal to carry on the moralistic and fustian verse of the period. It was a quarrel of technicians in verse-making. In 1922-23, the poets of disillusionment rallied around T. S. Eliot, whose poem, "The Wasteland," provided the negative background for their chorus of complaint. This was a challenge to romanticism, to chauvinism, and to the philosophy that states, "All's well that ends well." The romantics Alan Seeger, Rupert Brooke, and Joyce Kilmer had given testimony in blood and breath, but the newer poets, realists of the trenches, remembered the lost genius of Wilfrid Owen, Edward Thomas, and Francis Ledwidge on the battlefields, and turned against the old order. It was a revolt against tradition, and having flared bright with the light of Eliot, it faded with his refusal to be a leader.

The quarrel of the early thirties began in England around the audacious Auden, and the coterie which included

Stephen Spender, Louis MacNeice, Dylan Thomas, and others who borrowed their poetic devices from Gerard Manley Hopkins, and seized upon the economic and social ideas of Karl Marx as a substitute for God and the monarchy. They got no help from T. S. Eliot, who shifted his base spiritually and politically. Eliot, as much a technical innovator as ever, became an Anglican in religion and a monarchist in politics. The talented young English poets staged an impudent uprising against the standard-bearers of English poetry. The classical and romantic bards of the 19th century were given a rough combing in the critical analyses of the Auden group. It was a revolt against ideas, and it made its mark on current poetic trends. The quarrel of the poets had turned from the religious and moral to the social and political, and much of the debate consisted of verbal shadow-boxing.

Poetic turbulences are usually surface storms which do not disturb the depths of great esthetic principles. The young English poets soon found Marxian tenets indigestible and the Russian experiment a confusion of ideals and ideology. They also saw their poetry debauching itself into journalism, and their visions deluded by false beacons. There are still many poets in America and England attempting to carry the banners of social reform, but most of them are in a dead-end street, and are finding it hard to back out with good grace.

Not much great, or even good, poetry came out of the Second World War, and no new poet of first magnitude has made his appearance since the war's end. Perhaps we are in the dead calm that presages a storm. There is some indication of poetic excitement in the vitality and original statements of a few poets. However this may be, the more or less accepted poets, men over 45, have given us the best verse during 1947.

ROBERT FROST

Robert Frost carries on his traditional poetry in *Steeple Bush,* which reveals that the same sensitive, querulous, witty mind is at work. In the second of his *Masques,* Frost is far from successful, playing jackanapes with the Biblical and Christian tradition. He pokes fun at, and torments the Christian concepts—not necessarily as an unbeliever, but with the candor of a privileged member of the family. Frost in the "Masque" adds nothing to his stature as a poet, and gains little as playwright, or philosopher.

HILLYER, BENÉT AND OTHERS

Robert Hillyer, Pulitzer winner in 1934, maintains the steady flow of high-level lyricism in *Poems for Music.* William Rose Benét's *The Stairway of Surprise* gathers up the loose strings of his poetic efforts, and gives the public his best book in more than a decade. Rolfe Humphries' new and carefully chiselled poems in *Forbid Thy Ravens* holds a high level of original lyric statement, although it is more mannered than his previous volume, *The Summer Landscape,* and occasionally suffers from the author's intrusive preachments. Witter Bynner's *Take Away the Darkness* maintains the Bynner style of brevity and philosophic wit, and contains several poems which hold his standard high in the field of compact, philosophic writing. Theodore Maynard's *Selected Poems* include several new and crystalline lyrics which add to his stature as a singer whose voice will be heard with pleasure in any year.

WOMEN POETS

Among the women, Louise Townsend Nicholl offers us a distillation of several years of poetic refining in her small book, *Life Is the Flesh.* Tight and solid as John Donne is in putting words together, Miss Nicholl makes them ring with a clear resonance. Laura Benét's *Is Morning Sure?* is a collection of singable poems in which the poet's sympathy for her fellow man is always apparent. *Poems,* by Joan Murray, is a posthumous volume by a young girl whose loss makes us think of the potentials of Chatterton and Keats. Her death also reminds us of the young Englishman, Sidney Keyes, who was killed in the African campaign before the American invasion. Keyes, at 21, had much of the strength that marked the poetry of Wilfrid Owen, who died on the Sambre canal in 1918, near the end of the First World War. His collected poems were issued during the year with a preface by Herbert Read.

GREENBERG AND STEVENS

The name of Samuel Greenberg has always been allied to that of Hart Crane. Greenberg, whose collected poems were brought out in 1947 with an introduction by Allen Tate, shows a brilliance in metaphor that may have influenced Crane. Hart Crane's Brooklyn Bridge images are arresting in their originality and power, and the degree to which he was influenced by Greenberg is a matter of dispute. Greenberg died of tuberculosis in 1917, a victim of ghetto life at 23.

Wallace Stevens, in *Transport to Summer,* continues his long retreat to the recesses of the intellect. It tests the loyalty of the readers who love *Peter Quince at the Clavier* to follow Stevens in his mental excursions as he pares philosophic ideas to an invisible fineness. Stevens, as a thinker, is slowly crowding out the witty poet who wrote *Thirteen Ways of Looking at a Blackbird,* a superb example of poetic imagery.

AUDEN AND THE INTELLECTUALS

Auden got a mixed reception from the critics for his drawing room conversation piece, *The Age of Anxiety,* which is described as a "baroque eclogue." Auden is a scintillating technician in verse-making, and makes any idea sound interesting through his mastery of the poetic devices. He is the most energetic force in modern poetry, a catalyst of poetic action, but we must delay appraisal of what he says until the excitement of how he says it wears off.

Among the other intellectual poets are Selden Rodman, a technical innovator with the courage to be different at the expense of the reader's sympathy. *The Amazing Years* considers our time in a journal of a sharp-witted reporter, but it is hard going at times. Oscar Williams' *Selected Poems* reveal the talents of a visual mind, reporting the world about him in a rhetoric which crackles with verbal fireworks of metaphor piled upon metaphor. Karl Shapiro, who gave high promise a few years ago and won the Pulitzer Award, is encountering difficulty in finding themes that go beyond devices for his clever wit, and technical qualifications. His *Trial of a Poet,* a volume of verse comprising other poems than the title piece, considers the plight of Ezra Pound in relation to the responsibility of an artist in wartime. This work followed his *Essay on Rime,* an interesting *tour de force* in which Shapiro carries on the tradition of Horace and Pope as a critic employing the media of verse.

The younger intellectual poets are in the main excellent craftsmen, but they are still searching for theses or facets of themes that fit in with their mental attitude. They have indignation against the stupidity of their elders, barbed speech with points keen for the wounding, but they are not quite willing to continue in a pose of negation. Some regain faith, as Eliot and Auden, but once irony has taken command it becomes increasingly difficult to maintain an affirmative stance in a world that threatens itself with ruin.

THE YOUNGER POETS

Among the younger poets of talent who have curry-combed the hides of a scabrous world are J. F. Nims in his *The Iron Pastoral,* a work of considerable merit; Dunstan Thompson in *Lament for the Sleepwalkers,* poems of considerable vitality and drum-beating, and Howard Nemerov, whose book *The Image and the Law* has the virtues and the faults of a voice dominated by the mind. Hugh Chisolm, in "The Prodigal Never Returns," has a gift for crisp statement and fresh rhetoric, but he has no solace for the heart of man. Weldon Kees, whose work has appeared in *Poetry,* a magazine of verse, offers in "The Fall of the Magicians," verse superb in its device, disturbing in its total effect.

Thomas Merton, a young Trappist monk, is finding favor, not only among lovers of poetry of a spiritual impulse, but also among the poets who are indifferent to religious concepts. Merton's book, *Figures for an Apocalypse,* introduces a dazzling use of metaphor, but he has not yet produced any poetic sequence of major proportions or sustained poem on a central theme. Some critics look to Merton as the spiritual promise of a poet of the stature of Francis Thompson, or Gerard Manley Hopkins. Sister Madeleva's *Collected Poems* gathers together the familiar poems with a few new lyrics, and makes us regret that her religious duties limit her working hours at poetry to a few hours a year.

Frederic Prokosch, in his *Chosen Poems,* enables us to get a three-dimensional view of his stature as a poet. Prokosch is a musical sedative compared to the keen-toothed and often cacophonous intellectuals. His poetry, in its best sense, is vegetable, and of lush growth, but it is rewarding, especially after reading the stormy lines of angry lads or the conundrums of men in ivory towers.

NEGRO POETS

The standard Negro poets are represented in a book of the late Countee Cullen, whose lyric reputation gains with the publication of *In These Islands.* Langston Hughes, more socially-minded, is less effective, in *Fields of Wonder.* Owen Dodson, a new Negro voice, makes a dramatic use of response and antiphon in his modern chorales. His book *Powerful Long Ladder* is extremely race-conscious to the injury of an excellent talent.

LIGHT AND SATIRIC VERSE

In the field of light and satiric verse the good news of a book by Samuel Hoffenstein was blighted by word of his death just a few days prior to publication. There were nearly 20 years between the successful Hoffenstein collection, *Poems in Praise of Practically Nothing* and *Pencil in the Air.* The second book has a gentler, more philosophic humor than the good-natured but nonetheless rough-edged jibes of the younger Hoffenstein (before Hollywood absorbed his time and talent).

It is not easy to classify Melville Cane's cameo poems published under the title of *A Wider Arc.* Cane is a wit but he is also a sensitive poet and a careful craftsman. One misses the happy humor of Arthur Guiterman in the current crop of light verse. Nor is there any worthy collection of the *vers de société* for the year, since none of the standard light verse writers, Phyllis McGinley, David McCord, or Morris Bishop, have reported recent volumes. The number of protesting, serious young poets, is large if for the most part undistinguished. There is no counter-irritant among them, nor comic relief, and one might welcome a gentle fun-maker in the tradition of Austin Dobson or Andrew Lang. The maverick humorist, Ogden Nash, is still alone in his chosen patterns, with others unwilling or unable to follow his haphazard sentence structure and rhythms.

POETRY ANTHOLOGIES

Every year produces a new group of poetry anthologies, some specialized, some general, and a few inclusive. A good anthology makes money for its editors and publisher; it seldom makes money for the poet beyond the first fee which is grudgingly paid. In a large anthology, these fees can aggregate into a sizeable investment, and the lack of a fee often weakens the quality standards of the anthology. Among the recent anthologies reflecting careful research and editing are William Williamson's *The Eternal Sea,* Kathleen Hoagland's *1000 Years of Irish Poetry,* and Sister Marie Thérèse's *I Sing of a Maiden,* a collection of poems of the Blessed Virgin by Catholics, Protestants, and a variety of unbelievers. It is impossible to list, or even comment briefly, on the numerous anthologies of dogs, cats, trees, birds, and special occasions which constantly pour from the press, many of which are money-making pot-boilers of indifferent literary standards.

CONCLUSION

Despite the fact that we live in the most poetic epoch in the world's history, the poet finds it difficult to command an audience against the competition of the other art forms and the distractions of our current dangers and amusements. Too much of the poet's energy is wasted in private conversation with fellow poets. He speaks for the elect who have learned the special vocabulary of the intellectual, talking, as a critic said, "out of the side of his mouth." Poetry is flourishing for the most part without benefit of the printing press, but the poets are not doing so well. There is always hope, however, for an affirmative voice.

HISTORY

By Richard W. Leopold
Assistant Professor, Harvard University

CONTINUING EFFECT OF THE WAR

During 1947, the blighting effect of the war continued to be felt in the field of History. Although qualitatively and quantitatively the year registered a slight gain over its predecessor, the number of worthwhile books remained below the pre-war figure. Until research begun before 1941 can be completed, until the first generation of post-war dissertations are printed, until the teaching load in crowded colleges can be lightened, until students can again work freely in foreign repositories, and until publishers reach some solution for skyrocketing costs, it is unlikely that historical scholarship in America will resume its normal status. Not the least discouraging feature of the last 12 months has been the prohibitive prices that have been placed upon almost all serious works.

TOYNBEE AND NEVINS

One hopeful sign in a disappointing year was the spectacular sale of D. C. Somervell's abridgement of A. J. Toynbee's six-volume *A Study of History* (Oxford). It is a rare tribute to the American reading public that one Englishman's tightly-packed condensation of another Englishman's unfinished survey of the decay of civilizations should find so eager an audience. Published in March, the Somervell abridgement maintained second or third place in the non-fiction best-seller list from June to October, and as the year closed it ranked seventh.

Second only in importance to Toynbee's unexpected popularity was the appearance of the first installment of Allan Nevins, *Ordeal of the Union* (Scribner), a comprehensive narrative of the Civil War era. Projected on a canvas broader than that of Rhodes or von Holst and based upon a variety of sources unmatched by any previous writer, the two volumes (covering 1848-1857) are a convincing demonstration that history can be instructive, authoritative, exciting, and enjoyable.

OTHER TRENDS

Other trends of the year deserve brief mention. A new cooperative history of the South was begun; progress was made in a similar enterprise on American economic development; the twentieth century continued to claim attention; and the first war histories by trained scholars appeared. Rich source materials, such as the journals of Francis Parkman, the letters of Henry Adams, and the notebooks of Henry James, were published. A tendency to reprint was evidenced by several distinguished anthologies, two collections of travelers' accounts, a running narrative by contemporaries of the Civil War, and a condensation of Henry Adams' nine-volume history of the Jefferson and Madison administrations. The vogue for pictorial histories persisted. As in previous years, valuable additions to historical scholarship were made in the field of biography.

GENERAL WORKS

Few works of a general nature appeared in 1947. Emery Neff, *The Poetry of History* (Columbia) attempts to show how the spirit, form, and content of historical writing since Voltaire has been influenced by literature, science, and political events. J. B. Conant, *On Understanding Science* (Yale), is an important contribution to the intellectual history of the seventeenth and eighteenth centuries. The role played by the Dark Continent is outlined in *The World and Africa* (Viking) by W. E. B. DuBois; while a heroic theme is developed in *The Search for the North Pole* (Richard R. Smith) by N. M. Crouse. D. J. Grout, *A Short History of the Opera* (Columbia) is a scholarly, two-volume work; R. H. Shryock, *The Development of Modern Medicine* (Knopf) is an enlarged version of a useful survey first published in 1936.

WAR HISTORIES

During 1947, the torrent of hasty, undocumented war books began to give way to the products of trained scholars. Outstanding on the diplomatic side is W. L. Langer, *Our Vichy Gamble* (Knopf), a comprehensive and incisive narrative of our relations with the Pétain régime. Walter Millis, *This Is Pearl!* (Morrow), depends largely on Congressional hearings for the preliminaries of the Japanese attack. Although neither scholarly in research nor impartial in temper, *Pearl Harbor* (Devin-Adair) by George Morgenstern will interest future historians as the first revisionist interpretation. The key role of scientific warfare is underlined in J. C. Boyce, *New Weapons for Air Warfare* (Little, Brown) and in L. R. Thiesmeyer and J. E. Burchard, *Combat Scientists* (Little, Brown). Several government agencies, such as the Office of Price Administration and the War Production Board, compiled digests of their wartime activity.

The year also witnessed the launching of *The United States Army in World War II,* a series prepared by the Historical Section and treating administration, planning, and operations. The initial volume, *The Organization of Ground Forces* (Government Printing Office), is the work of three well-known historians, K. R. Greenfield, R. R. Palmer, and B. I. Wiley. Although the Navy is not sponsoring an official history, several scholarly productions based on its classified records were completed. *The Battle of the Atlantic, 1939-1943* (Little, Brown) and *Operations in North African Waters, 1942-1943* (Little, Brown) comprise the first installments of S. E. Morison's multivolume *History of United States Naval Operations in World War II.* The war's greatest sea engagement is seen through American eyes in C. V. Woodward, *The Battle for Leyte Gulf* (Macmillan) and through those of the enemy in J. A. Field, Jr., *The Japanese at Leyte Gulf* (Princeton). One phase of the administrative achievement is related in D. S. Ballantine, *U. S. Naval Logistics in the Second World War* (Princeton).

UNITED STATES HISTORY

Save for Nevins, there was no outstanding general work in 1947 on the history of the United States. A sensitive portrait of the American mind since 1896 is delineated in Lloyd Morris, *Postscript to Yesterday* (Random House). J. H. Franklin, *From Slavery to Freedom* (Knopf), is a well-balanced and temperate survey of the Negro since colonial days. J. E. Pollard, *The Presidents and the Press* (Macmillan) is useful but by no means definitive. Suggestive material is contained in H. P. Fairchild, *Race and Nationality as Factors in American Life* (Ronald) and in *The Study and Teaching of American History* (National Council for Social Studies) edited by R. E. Thursfield.

THE AMERICAN COLONIES

Two works of conspicuous merit on American colonial life were published in the last 12 months. L. B. Wright, *The Atlantic Frontier* (Knopf), traces the transplanting of European civilization in North America up to 1763. T. J. Wertenbaker, *The Puritan Oligarchy* (Scribner) is a fresh, penetrating though sometimes uneven account of Massachusetts Bay. Lesser studies for the years before independence include J. C. Wise, *The Mystery of Columbus* (Monticello); D. L. Rights, *The American Indian in North Carolina* (Duke); A. E. Smith, *Colonists in Bondage: White Servitude and Convict Labor in America, 1607-1776* (North Carolina); A. O. Porter, *County Government in Virginia* (Columbia); A. V. Goodman, *American Overture: Jewish Rights in Colonial Times* (Jewish Publication Society).

REGIONAL HISTORY

Regional history claimed several books of primary importance in 1947. E. M. Coulter, *The South during Reconstruction, 1865-1877* (Louisiana), is the first volume to appear in a new cooperative *History of the South.* F. B. Simkins, *The South, Old and New* (Knopf), is an authoritative yet entertaining history since 1820. The results of a decade's research are summarized in H. W. Odum, *The Way of the South* (Macmillan). Another region is explored in *The Great Northwest* (Knopf) by O. O. Winther. R. G. Cleland, *California in Our Time, 1900-1940* (Knopf), is a work of solid merit. Most widely read of all, however, was Bernard DeVoto's *Across the Wide Missouri* (Houghton, Mifflin), which describes with high literary skill and contemporary paintings the climax of the Rocky Mountain fur trade between 1832 and 1838.

Designed for popular consumption are Jay Monaghan, *The Overland Trail* (Bobbs-Merrill); R. K. Kincaid, *The Wilderness Road* (Bobbs-Merrill), and Townsend Scudder, *Concord: American Town* (Little, Brown). More specialized studies include T. C. Blegen, *Grass Roots History* (Minnesota); L. F. Brewster, *Summer Migrations and Resorts of South Carolina Low-Country Plantations* (Duke); Alexander McLeod, *Pigtails and Gold Dust* (Caxton); and C. F. McGlashan, *History of the Donner Party* (Stanford).

POLITICAL AND CONSTITUTIONAL HISTORY

Two books that add little to the subjects they treat are W. F. McCaleb, *The Conquest of the West* (Prentice-Hall), dealing with the years 1803-1848, and A. H. Bill, *Rehearsal for Conflict* (Knopf), retelling the story of the Mexican War. *American Communism* (Dutton) by James Oneal and G. A. Werner attempts to describe the origins and development of that party in the United States. K. C. MacKay, *The Progressive Movement of 1924* (Columbia), is a competent dissertation. Voting trends are examined in C. A. M. Ewing, *Congressional Elections, 1896-1944* (Oklahoma) and in E. E. Robinson, *They Voted for Roosevelt: the Presidential Vote, 1932-1944* (Stanford).

C. P. Curtis, Jr., *Lions under the Throne* (Houghton, Mifflin) is a stimulating but hardly novel analysis of legislation by the Supreme Court. Two books by eminent authorities are E. S. Corwin, *Total War and the Constitution* (Knopf) and W. E. Binkley, *President and Congress* (Knopf). A long-neglected problem of colonial administration is elucidated in E. S. Pomeroy, *The Territories of the United States, 1861-1890* (Pennsylvania). Minor studies in constitutional history include J. M. Jones, *Full Powers and Ratification* (Macmillan); M. R. Konvitz, *The Constitution and Civil Rights* (Columbia); R. K. Carr, *Federal Protection of Civil Rights* (Cornell); and E. K. Ware, *A Constitutional History of Georgia* (Columbia).

DIPLOMATIC HISTORY

As might be expected, most writings on American diplomatic history dealt with the recent past. J. C. Campbell, *The United States in World Affairs, 1945-1947* (Harper) maintains the high standard set by its predecessors before this annual summary by the Council on Foreign Relations was suspended in 1941. Three volumes in the "American Foreign Policy Library" combine in varying amounts history and current events. Dexter Perkins, *The United States and the Caribbean* (Harvard), provides the fullest historical background; but both V. M. Dean, *The United States and Russia* (Harvard) and E. A. Speiser, *The United States and the Near East* (Harvard) are useful. Dorothy Borg, *American Policy and the Chinese Revolution, 1925-1928* (Macmillan), is detailed and well documented. Two monographs are Werner Levi, *American-Australian Relations* (Minnesota) and Robert Langer, *Seizure of Territory* (Princeton), the second examining the theory and practice of the Stimson Doctrine.

SOCIAL HISTORY

No important contribution to American social history was made in 1947. Dutton began its "Society in America" series with Cleveland Amory's *Proper Bostonians*, a book more valuable to the raconteur than to the scholar. A different segment of society is differently handled in W. F. English, *The Pioneer Lawyer and Jurist in Missouri* (Missouri).

American colleges are considered in Horace Coon, *Columbia* (Dutton); G. F. Govan and J. W. Livingood, *The University of Chattanooga* (Chattanooga); and Mary Watters, *The First Hundred Years of MacMurray College* (MacMurray). Newton Edwards and H. G. Richey discuss the dynamics of education in *The School in the American Social Order* (Houghton, Mifflin); while S. H. Ditzion's *Arsenals for a Democratic Culture* (American Library Association) essays a social history of the public library movement in New England and the Middle States between 1850 and 1900. Other books include R. D. Mosier, *Making the American Mind* (King's Crown), a digest of ideas in the McGuffey readers; E. W. Thompson, *Education for Ladies, 1830-1860* (King's Crown), a summary of thoughts on education in women's magazines; and C. H. Wilson, *Education for Negroes in Mississippi since 1910* (Meador).

Miscellaneous social themes are covered in Julia Neal, *By Their Fruits: the Story of Shakerism in South Union, Kentucky* (North Carolina); Arnold Mulder, *Americans from Holland* (Lippincott); Roger Burlingame, *Inventors behind the Inventors* (Harcourt, Brace); Morris Fishbein, *A History of the American Medical Association, 1847 to 1947* (W. B. Saunders); and John Durant, *The Story of Baseball* (Hastings).

INTELLECTUAL HISTORY

The most widely read book of the year on American literature was Van Wyck Brooks, *The Times of Melville and Whitman* (Dutton), the fourth in a series that becomes less and less useful as intellectual history. George Snell surveys briefly *The Shapers of American Fiction, 1798-1947* (Dutton); while an important aspect of American thought is ably exploited in *The Comics* (Macmillan) by Coulton Waugh. In the field of journalism, C. S. Brigham's long-awaited *History and Bibliography of American Newspapers, 1690-1820* (American Antiquarian Society) appeared. R. W. Jones, *Journalism in the United States* (Dutton) does not measure up to previously published histories. More useful, though more restricted, are J. A. Isely, *Horace Greeley and the Republican Party, 1853-1861* (Princeton), essentially a study of the *New*

York Tribune; N. N. Luxon, *Niles' Weekly Register* (Louisiana); the third volume of Philip Kinsley, *The Chicago Tribune* (Chicago Tribune) covering 1880-1900; and W. B. Rice, *The Los Angeles Star, 1851-1864* (California). R. C. Ellison, *Early Alabama Publications* (Alabama) is a study in literary interests.

ECONOMIC HISTORY

The year saw rich contributions to American economic history. Two additions to the cooperative *Economic History of the United States,* (Rinehart) are George Soule, *Prosperity Decade, 1917-1929* and Broadus Mitchell, *Depression Decade, 1929-1941.* P. S. Foner, *History of the Labor Movement in the United States* (International), describes with a slight leftist tinge the rise of the worker from colonial days to 1886. *Commonwealth* (New York University) by Oscar and Mary F. Handlin, discusses the role of government in the economy of Massachusetts from 1774 to 1861 with an emphasis on the social implications. R. W. Paul, *California Gold* (Harvard), while primarily concerned with mining, also stresses social forces. J. D. Phillips, *Salem and the Indies* (Houghton, Mifflin), combines an account of commercial enterprise with local history of a high order. M. P. DuVal, Jr., *And the Mountains Will Move* (Stanford), deals with the economics of building the Panama Canal.

Designed for the general reader are S. H. Holbrook, *The Story of American Railroads* (Crown); A. F. Harlow, *The Road of the Century* (Creative Age); S. W. Bryant, *The Sea and the States: a Maritime History of the American People* (Crowell); Marquis James, *The Metropolitan Life* (Viking); M. E. Sheppard, *Cloud by Day: the Story of Coal and Coke and People* (North Carolina); and C. M. Wilson, *Empire in Green and Gold: the Story of the American Banana Trade* (Holt).

Monographs include P. E. Abelarde, *American Tariff Policy towards the Philippines, 1898-1946* (King's Crown); W. W. Belcher, *The Economic Rivalry between St. Louis and Chicago, 1850-1880* (Columbia); Kenneth Bjork, *Saga in Steel and Concrete: Norwegian Engineers in America* (Norwegian American Historical); Walter Firey, *Land Use in Central Boston* (Harvard); Edwin Frickey, *Production in the United States, 1860-1914* (Harvard); T. S. Harding, *Two Blades of Grass: a History of Scientific Development in the U. S. Department of Agriculture* (Oklahoma); J. W. Livingood, *The Philadelphia-Baltimore Trade Rivalry, 1780-1860* (Pennsylvania Historical Commission); E. C. May, *A Century of Silver* (Robert M. McBride); H. L. Staples and A. T. Mason, *The Fall of a Railroad Empire* (Syracuse); and W. F. Wilcox, *The Farmer in the Second World War* (Iowa State).

THE ARTS

The year's outstanding contribution to the history of American art is J. T. Flexner, *American Painting: First Flowers of the Wilderness* (Houghton, Mifflin). C. P. Hornung, *Handbook of Early American Advertising Art* (Dover), tills a new field. Other works are Wolfgang Born, *Still Life Painting in America* (Oxford); Deering Davis, *Annapolis Houses, 1700-1775* (Architectural Book); John Drury, *Historic Midwest Houses* (Minnesota); Harry Birdoff, *The World's Greatest Hit: "Uncle Tom's Cabin"* (S. F. Vanni); E. J. Gergely, *Hungarian Drama in New York, 1908-1940* (Pennsylvania); and E. J. R. Isaacs, *The Negro in the American Theatre* (Theatre Arts).

PICTORIAL HISTORY

Despite high price tags, Roger Butterfield, *The American Past* (Simon and Schuster) and Agnes Rogers and F. L. Allen, *I Remember Distinctly* (Harper), became best-sellers. The first utilized the technique of *Life* magazine; the latter is a pictorial abridgement of Allen's *Only Yesterday* and *Since Yesterday.* Other books of this nature are W. J. Lane, *A Pictorial History of Princeton*

(Princeton); E. P. Alexander, *The Pennsylvania Railroad: a Pictorial History;* and Desider Holisher, *Pilgrims Path* (Stephen-Paul).

MILITARY AND NAVAL HISTORY

In addition to histories of the recent war effort, the following may be noted: J. R. Jacobs, *The Beginnings of the U. S. Army, 1783-1812* (Princeton); Allen Westcott, *American Sea Power Since 1775* (Lippincott); and S. F. Horn, *Gallant Rebel* (Rutgers), on the *CSS Shenandoah.*

THE OTHER AMERICAS

C. H. Haring summarizes a long study of Spanish colonial institutions in *The Spanish Empire in America* (Oxford). Two aspects of the race problem in this hemisphere are treated in Frank Tannenbaum, *Slave and Citizen: The Negro in the Americas* (Knopf) and in John Collier, *The Indians of the Americas* (Norton). Lesser works include T. E. Sanford, *The Story of Architecture in Mexico* (Norton); Arnold Hoffman, *Free Gold: the Story of Canadian Mining* (Rinehart); and Paul Blanshard, *Democracy and Empire in the Caribbean* (Macmillan).

EUROPEAN HISTORY

Still shut off from customary sources, American scholars made but slight contributions in 1947 to the history of countries other than their own. No work of outstanding prominence was published.

Books on the Ancient, Medieval, and early Modern periods include H. E. Winlock, *The Rise and Fall of the Middle Kingdom of Thebes* (Macmillan); W. W. Hyde, *Ancient Greek Mariners* (Oxford); W. A. Morris and J. R. Strayer, *The English Government at Work, 1327-1336* (Medieval Academy of America); James Broderick, *The Progress of the Jesuits, 1556-1579* (Longmans, Green); J. H. Mitchell, *The Court of the Connetablie: a Study of the French Administrative Tribunal during the Reign of Henry IV* (Yale); G. H. Dodge, *The Political Theory of the Huguenots of the Dispersion* (Columbia); E. J. Hamilton, *War and Prices in Spain, 1651-1800* (Harvard); Penfield Roberts, *The Quest for Security, 1715-1740* (Harper), a volume in the *Rise of Modern Europe* series; N. N. Schargo, *History in the "Encyclopedie"* (Columbia); and R. M. Brace, *Bordeaux and the Gironde, 1789-1794* (Cornell).

For the later modern period see M. R. Adams, *Studies in the Literary Backgrounds of English Radicalism* (Franklin and Marshall); A. W. Brown, *The Metaphysical Society* (Columbia); W. C. Chamberlin, *Economic Development of Iceland through World War II* (Columbia); J. R. Cuneo, *The Air Weapon, 1914-1916* (Military Service); H. W. Ehrmann, *French Labor: from Popular Front to Liberation* (Oxford); T. A. Jackson, *Ireland Her Own: an Outline History of the Irish Struggle for National Freedom and Independence* (International); Mary MacDonald, *The Republic of Austria, 1918-1934* (Oxford); C. A. Manning, *The Story of the Ukraine* (Philosophical Library); and W. Y. Tindall, *Forces in Modern British Literature, 1885-1946* (Knopf).

HISTORY OF ASIA AND AFRICA

There was no major work on these areas; but see G. C. Allen, *A Short Economic History of Modern Japan, 1867-1937* (Macmillan); K. S. Twitchell, *Saudi Arabia* (Princeton); R. L. Buell, *Liberia: a Century of Survival, 1847-1947* (Pennsylvania); C. H. Huberich, *The Political and Legislative History of Liberia* (Central Book Company); Julius Lewin, *Studies in African Native Law* (Pennsylvania); and C. M. Wilson, *Liberia* (Sloane).

XXV. LITERATURE AND LANGUAGE

BIOGRAPHY

By Malcolm Oakman Young
Reference Librarian, Princeton University

GENERAL

There are no outstanding new tendencies in the 1947 product of biographies, as in some of the past years. Both quantity and quality, however, are quite up to average. In *The New York Times Book Review* for Aug. 3, Prof. Henry Steele Commager, in connection with a preview of memoirs to be published, adequately surveys the memoirs of those active in public affairs published in the past ten years. The Pulitzer Prize was awarded to William Allen White's *Autobiography*.

COLLECTIVE WORKS

A volume attractive in every way is *American Portraits* (Holt), made up of 60 pictures by Enit Kaufman, accompanied with short biographical sketches by Dorothy Canfield. Richard D. Mallrey edited *Masterpieces of Autobiography* (Doubleday), a digest of ten titles. *Men of Law* (Macmillan), by William Seagle, contains short sketches of legal personalities from ancient to modern times. Rufus M. Jones in *Luminous Trail* (Macmillan) delineates certain saintly characters. Oscar Lewis' *Silver Kings* (Knopf) deals with the various developers of the Nevada Comstock Lode. Geoffrey T. Hellman includes some of his *New Yorker* "Profiles" in his *How to Disappear for an Hour* (Dodd, Mead). *The Other Side of the Record* (Knopf), by Charles O'Connell, is made up of amusing views of musicians and other entertainers. *The One with the Mustache Is Costello* (Random House) is also a series of brief sketches of entertainers by George Frazier. Essays on six English writers make up Laura L. Hinkley's *Ladies of Literature. The Proper Bostonians* (Dutton) is an often amusing book by Cleveland Amory.

THE PRESIDENTS

Frank Kingdon's *Architects of the Republic* (Beechhurst) assesses the contributions of Washington, Jefferson, Lincoln, Franklin D. Roosevelt. *Country Life in America, as Lived by Ten Presidents of the United States* (Knopf) is a compilation by Edward T. Booth. *Sons of Presidents* (Odyssey Press), by J. Perling, is another volume belonging to this group. A second volume of her well done work is Marie Kimball's *Jefferson, War and Peace, 1776-1784* (Coward). Another interpretation is *Thomas Jefferson: American Humanist* (Macmillan) by Karl Lehmann, while one side of the same subject is brought out briefly in *Thomas Jefferson, Champion of Religious Freedom* (Beacon) by Henry W. Foote. In her biography of Abigail Adams (Little, Brown), Janet Whitney of course includes certain light on John Adams. Several worthwhile volumes join the huge Lincoln bibliography: *Portrait for Posterity* (Rutgers University Press) by Benjamin P. Thomas, is a valuable survey of the principal biographies of Lincoln; *Abraham Lincoln, His Life, Work and Character* (Creative Art) is a compilation of extracts from many sources, edited by Edward Wagenknecht; J. G. Randall's *Lincoln, the Liberal Statesman* (Dodd, Mead), consists of eight illuminating essays; *The Lincoln Reader*, edited by Paul M. Angle (Rutgers University Press) contains 179 articles picturing every phase of his life. G. A. Sumner's *Meet Abraham Lincoln* (Harper) is a brief volume of essays containing some little known material. The first volume of what promises to be a high-ranking work is Arthur S. Link's *Wilson: The Road to the White House* (Princeton University Press). In *The New York Times Book Review* for Jan. 26, Karl Schriftgiessen surveys the books appearing on Franklin D. Roosevelt. The first volume of his correspondence is *Franklin Delano Roosevelt,* *His Personal Letters, Early Years* (Duell). Alden Hatch's book on this subject is intended for juveniles (Holt). *Reilly of the White House* (Simon, Schuster), as told by Franklin D. Roosevelt's Secret Service guard, Michael Reilly, to W. J. Slocum, gives us vivid pictures of the President. A political biography is *Harry Truman* (Duell) by William P. Helm.

POLITICAL FIGURES

Edited by Carl Van Doren, *Letters and Papers of Benjamin Franklin and Richard Jackson* (American Philosophical Society) bring new light on the two 18th century figures. Relating the orator to his times is Jacob Alexad's *Patrick Henry: the Voice of Freedom* (Random House). A less known character is revealed in William L. Lucey's *Edward Kavanagh: Catholic, Statesman, Diplomat from Maine, 1795-1844* (Marshall Jones). Covering only part of the subject's life is Charles C. Tansill's *Congressional Career of Thomas Francis Bayard, 1869-1885* (Georgetown University Press).

A vivid picture of Michigan of the early 19th century is produced in Kent Sagendorph's *Stevens Thomson Mason* (Dutton), the subject having been Secretary and Acting Governor of the Territory. New York state politics form the setting of *Thurlow Weed: Wizard of the Lobby* (Little, Brown) by G. G. Van Deusen. *Benjamin F. Perry, South Carolina Unionist* (Duke University Press) is by Lillian A. Kibler.

A study of the decade prior to the Civil War is carefully done by Jeter A. Isely in his *Horace Greeley and the Republican Party, 1853-1861* (Princeton University Press). *Forgotten First Citizen* is by Margaret Clapp who portrays John Bigelow, active in city, state, national affairs, and diplomat. Gifford Pinchot's *Breaking New Ground* (Harcourt) is the timely story of the author's efforts for conservation of our natural resources, and the politics involved. Joseph E. McLean's *William Rufus Day* (Johns Hopkins Press) is a portrait of the Supreme Court Justice. The fifth volume of Josephus Daniels' autobiography is *Shirt-Sleeve Diplomat* (University of North Carolina Press), covering his ambassadorship to Mexico. Including three generations, *The Wallaces of Iowa* (Houghton Mifflin) is by Russell Lord. Two New York City figures appear in the autobiographical volumes, *Night Stick* (Dial) by Lewis J. Valentine, Police Commissioner, and *You're the Boss* (Viking) by Edward J. Flynn, Democratic leader. Another biography of Gen. George C. Marshall has appeared, this one by William F. Frye (Bobbs-Merrill).

MILITARY FIGURES

In *The First Captain* (Coward), Gerard W. Johnson studies John Paul Jones and his influence. A soldier of fortune in the Far East of the middle 19th century, Frederick T. Ward, is vividly treated by Hallett Abend (Doubleday). Roy Meredith has collected, with some text, many portraits in a volume called *The Face of Robert E. Lee* (Scribner). *I Fought with Custer* (Scribner) by F. and R. Hunt, is the story of Charles Windolph, probably the last survivor of the massacre. Among the many Second World War volumes, the following are outstanding: *The Big Yankee* (Little, Brown) by Michael Blanford, a life of the Marine Carlson; *War As I Knew It* (Houghton Mifflin) by the late Gen. George S. Patton, Jr.; *Halsey's Story* (Whittlesey) by Admiral Halsey.

AUTHORS

An almost forgotten humorist is recalled in Cyril Clemens' *Shillaber* (International Mark Twain Society). *The Amiable Autocrat* (Schuman), by Eleanor M. Tilton, is another biography of Oliver Wendell Holmes, the elder. Mason Wade, biographer of historian Parkman has now edited the valuable *Journals of Francis Parkman* (Harper), in two volumes. *"Ben Hur" Wallace* (University of California Press) is by Irving McKee. Three important years, and their influence, are chronicles in *Mark Twain in Nevada* (Scribner) by Effie M. Mack. The intellectual history of the United States is included in *The James Family* (Knopf) by F. O. Matthiessen, who surveys William and Henry James, their father, Henry Sr., and their less known sister Alice. *Henry Adams and His Friends* (Houghton Mifflin) is a collection of Adams' unpublished letters, edited by Harold D. Cater, and making a vivid picture of the group. In his biography, *George Ade* (Bobbs-Merrill), Fred C. Kelly emphasizes the humorist's influence on his time. *Jack London, American Rebel* (Citadel) is a selection of his writings plus a biography by Philip S. Foner. In a pleasant volume (Macmillan), John Lomax relates his adventures ballad hunting.

With a new introduction by H. L. Mencken, his three autobiographical books have appeared in a one-volume edition (Knopf). *A House in Chicago* (University of Chicago Press) by O. H. Dunbar, pictures Mrs. William Vaughn Moody and the literary circle centered there. *The Marble Man's Wife* (Scribner), by Hayden Norwood, pictures the mother of Thomas Wolfe. In *These Things Are Mine* (Macmillan), the playwright George Middleton writes of himself and his friends. The debunking biographer W. E. Woodward calls his autobiography *The Gift of Life* (Dutton). *Linden on the Saugus Branch* (Random House) is the recalled childhood of Elliot Paul. Another book of childhood memories is MacKinley Kantor's *But Look the Morn* (Coward). A short book is *The Case of Erle Stanley Gardner* (Morrow) in which Alva Johnson reviews the detective story writer. *We Were Interrupted* (Doubleday) is another volume of the memoirs of Burton Rascoe. John Erskine's delightful *The Memory of Certain Persons* (Lippincott) concerns himself as teacher, writer, musician and critic. *American Memoir* (Houghton Mifflin), partly a republishing of earlier volumes, is Henry Seidel Canby's contacts with the literary life of the past two or three decades.

THE PRESS

Two more volumes center around the Kansas editor: *William Allen White's America* (Holt) by Walter Johnson and White's *Selected Letters* (Holt), edited with introduction by Walter Johnson. Among other interesting experiences, George Creel in his *Rebel at Large* (Putnam) gives sidelights on Wilson. *Some Days Were Happy* (Random House) is the columnist Louis Sobol's reminiscences. Light reading is *Man on the Half Shell* (McGraw-Hill) in which Frederick C. Othman, reporter, tells his Hollywood and Washington experiences. *Champagne Cholly* (Dutton) is Eve Brown's life of Maury Paul, society reporter of the 20's and 30's. Further reminiscences by Robert J. Casey are entitled *More Interesting People* (Bobbs-Merrill). *More Post Biographies* (University of Georgia) is a collection of sketches of journalists, appearing first in the *Saturday Evening Post*. *An American Dynasty* (Doubleday), by John Tebbel, deals with the newspaper families of the McCormicks and the Pattersons with Chicago and Washington as backgrounds.

MINISTERS AND EDUCATORS

World of Justus Falckner (Muhlenberg Press) is a rediscovery by Delber W. Clark of the 18th century Lutheran pastor influential in the Hudson Valley. *The Soul of Frederick W. Robertson* (Harper) is James R. Blackwood's analysis of the Brighton preacher. *Lyman Pierson Powell* (Philosophical Library) is Charles MacFarland's narrative of the preacher, lecturer, writer. Two volumes concern less known ministers: Green P. Wertenbaker's *Pierre B. Hill* (McGraw-Hill) introducing a missionary among Texan cowboys; *Laughing into Glory* (Stewart), the early memories of Hodge M. Eagleson, Methodist minister at the turn of the century.

Alexander D. Bache, President of Girard College and scientist, is delineated by Merle M. Odgers (University of Pennsylvania Press). The first president of Bryn Mawr, the individualistic Carey Thomas, is pictured by Edith Finch (Harpers). A pleasant volume is *Amherst Boyhood* (Amherst College) by Alfred E. Stearns, former headmaster of Andover.

SCIENTISTS, DOCTORS

A little known individual, Josiah White (Stephen Daye), is brought to light by Eleanor Morton, as a miner, inventor, and developer of the Pennsylvania coal resources. Another 19th century inventor and engineer, James B. Eads, is recalled by Florence Dorsay in *Road to the Sea* (Rinehart). *Douglas of the Fir* (Harvard University Press), by A. G. Harvey, is the story of the botanist and explorer, David Douglas. *Hermon Carey Bumpus* (University of Minnesota Press) is by Hermon C. Bumpus, Jr., son of the 19th century naturalist. *Thomas Edward Shields, Biologist, Psychologist, Educator* (Scribner) is by Justine Ward. *Henry Sewall, Physiologist and Physician* (Johns Hopkins Press) is by Desmond Powell. A lighter production is *A Doctor in the House* (Lippincott), reminiscences of the general physician by Henry Pleasants, Jr. Another readable narrative is *Petticoat Surgeon* (Pellegrini), by Bertha Van Hoosen, whose 60 years of experience took her to many parts of the world. Told with dry humor is another autobiography, *World Expands* (Harvard University) by the zoologist, George Howard Parker. *Banting's Miracle* (Lippincott), by Seale Harris, of course, deals with the developer of insulin. A two-volume compilation edited by Grace Crile is *George Crile* (Lippincott), autobiography of the surgeon and brilliant researcher.

INDUSTRIALISTS

Fred H. Colvin, in his *Sixty Years with Men and Machines* (Whittlesey), recalls much of this country's industrial history since the Civil War. Julian Dana brings to notice the power in the financial world, A. P. Giannini (Prentice). The life of War Production Chief and industrialist Knudsen is by Norman Beasley (Whittlesey). Jan Fisher's *Fabulous Hoosier* (McBride) is an account of her husband Carl G. F. Fisher, promoter, Hans W. Heinsheimer, immigrant who became a music publisher calls his memoirs *Menagerie in F Sharp* (Doubleday). The famous Chicago store is the center of *The Marshall Fields* (Dutton), written by John Tebbel.

VARIOUS ARTISTS

Harps in the Wind (Macmillan), by Carol Bunk, is the second volume within two years portraying the Hutchins, the New Hampshire family which from the 1840's sang its way through this country and abroad. A modern figure, Frank Sinatra, is the subject of *The Voice* (Harper) by Ely J. Kahn. The great orchestra conductor, Koussevitzky is portrayed by Moses Smith (Ellery Towne). *With Strings Attached* (Knopf) is an autobiographical volume by the violinist Joseph Szigeti. *We Called It Music* (Holt) by Eddie Condon, with the narrative by Thomas Sugrue, is a lively autobiography of the leading jazz man of the time. An actress of the 50's and 60's, Adah Lewis Menken, is recalled by Allen Lesser in *Enchanting Rebel* (Beechhurst).

A two-volume work on the painter and his work is *Charles Willson Peale* (American Philosophical Society) by Charles C. Sellers. The sculptor, Daniel Chester French, is entertainingly remembered by his daughter, Margaret F. Cresson, in *Journey in Fame* (Harvard University Press). Including reproductions of the artist's paintings of the Old West, *Frederick Remington* (Lippincott) by Harold McCracken, is an attractive volume. Another painter appears in *Russell Cheney* (Oxford) with notes by F. O. Matthiessen. Cyrus L. Baldridge in his *Time and Chance* (Day) includes many of his drawings done on his travels and amid his often adventurous career.

MISCELLANEOUS

This unusually large and varied group is begun with Willard H. Bonner's *Pirate Laureate* (Rutgers University Press), the life and legends of Captain Kidd. Another chronicle of the western explorers Lewis and Clark is by John Bakeless (Morrow). *Dark Companion* (McBride) by Bradley Robinson is the story of the negro Henson who accompanied Peary on his expeditions. Another polar explorer appears in *Manner of the North* (Duell), life of Captain Bob Bartlett by George D. Putnam. *There Was Once a Slave* (Messner) is a semi-fictional biography by Shirley Graham of the slave leader in the abolition movement, Frederick Douglass. *Ruggles of New York* (Columbia University Press) by D. G. B. Thompson recalls one active in New York City and state affairs in the early 19th century. *David Curtis Deforest and the Revolution of Buenos Aires* (Yale University Press) by Benjamin Keen deals with an American active in the business and political affairs of the Argentine in the 19th century.

The Articulate Sisters (Harvard University Press) is a small volume of passages from the journals and letters of the daughters of President Josiah Quincy of Harvard, edited by M. A. DeWolfe Howe. From a quite different atmosphere comes *The Cap'n's Wife* (Syracuse University Press), the adventurous life of Didama Doane, wife of a Cape Cod captain, by Albert J. George. Two autobiographies appear of women active in Chicago civic affairs: Hannah G. Solomon's *Fabric of My Life* (Bloch) and Sarah L. H. Hart's *The Pleasure Is Mine* (Abraham Lincoln Bookshop). *The Life of Judah Touro* (Jewish Publication Society) is Leon Huhner's account of an early American philanthropist. *Father and the Angels* (Dutton) by William Manners is the author's picture of his father, an Ohio rabbi.

In *920 O'Farrell Street* (Doubleday) Harriet L. Levy recalls her early home in San Francisco and her later days in Paris, in the circle of Gertrude Stein. Thought provoking is *My American Pilgrimage* by the Macedonian immigrant Stoyan Christowe.

Another Day, Another Dollar (Lippincott) is John T. Winterich's recollections of a Providence boyhood, and *When I Was a Boy in Boston* (Beechhurst Press) is by Charles Angoff. A book of value as a social picture is Katherine D. Lumpkin's *The Making of a Southerner* (Knopf), her life from Civil War days to the present. Another view of the American colony in Paris of the 20's and 30's is Samuel Putnam's *Paris Was Our Mistress* (Viking). *Green Memories* (Harcourt) by Lewis Mumford is the eloquent biography of the author's son, Geddes, killed in the Second World War.

Joseph Wedemeyer: Pioneer of American Socialism (International) is by Karl Obermann. *This Is My Story* (Whittlesey) is the timely story of Louis Budenz, ex-communist. *The Golden Voice: a Biography of Isaac Kalloch* (Farrar) by M. M. Marberry, revives the extraordinary character who was preacher, pioneer, mayor of San Francisco, railroad promoter. *Howe & Hummel* (Farrar) is Richard Rovere's vivid account of the notorious New York law firm. *Samuel Jones* (University of Oklahoma) is Ben Jones' story of an individualistic small town Kansas lawyer. Lloyd Morris' *Postscript to Yesterday* (Random House) is a provocative interpretation of the past 50 years based on personalities.

Well received was *My Life Story* (Duell) by Joe Louis, pugilist. *Strikeout Story* (Barnes) is the title given by the pitcher Robert W. A. Feller to his recollections. Rather critical of his subject is John G. T. Spink's *Judge Landis* (Crowell). A group of the informal type of biography are listed: Benedict and Mary Freedman's *Mrs. Mike* (Coward), telling of a "wilderness wife"; Haydie Yates' *70 Miles from a Lemon* (Houghton Mifflin); R. E. Gould's *Yankee Drummer* (Whittlesey); *The Loud Red Patrick* (Harcourt), Ruth McKenney's entertaining picture of her grandfather. *Journey to the End of a War* (Scribner) is the autobiography of Melvin Hall, whose life has been spread over most of the world, with service in the wars, all vividly narrated.

FOREIGN SUBJECTS

Two studies center on the Apostle Paul, one by Edgar J. Goodspeed (Winston), the other, *The Jew of Tarsus* (Macmillan) by Hugh J. Schonfield. *Alexander the Great* (Dutton) is a scholarly product by Charles A. Robinson, Jr. *Horace* (Harvard University Press) by Henry D. Sedgwick, includes an account of contemporary life. *Eternal Lawyer* (Macmillan), by Robert N. Wilkin, is another well-done treatise.

Alexander I of Russia (Norton), by L. I. Strakhovsky, is a story full of intrigue and glamor. Arthur S. Riggs' *Velazquez* (Bobbs-Merrill) is a study of the artist and his work. An early saint is the subject of Mabel Farnum's *St. Anthony of Padua* (Didier). The famous romance of Duse and d'Annunzio is the center of Bertita Harding's *Age Cannot Wither* (Lippincott). *Freud* (Howell) by Helen W. Puner reveals his life and mind. *The Great Elector* (University of Chicago Press) is by Ferdinand Schevill, and deals with the 17th century Frederick William of Brandenburg. The German labor leader of the 60's, Ferdinand Lassalle, is studied by David Footman (Yale University Press).

The amazingly versatile Albert Schweitzer receives further praise in *Prophet in the Wilderness* (Macmillan) by Hermann Hagedorn. *Difficult Star* (Longmans) is the story of the saintly Frenchwoman Pauline Jaricot, by Katherine Burton. *Two Romantics and Their Ideal Life* (Odyssey Press), by Vernon Loggins, is the narrative of the sculptress Elisabet Ney and her philosopher husband, Edmund Montgomery.

A valuable contribution is *Correspondence of Sir Thomas More* (University of Pennsylvania Press) edited by Elizabeth F. Rogers. Charles Norman's *So Worthy a Friend* (Rinehart) is a biography of Shakespeare. *Sir Humphrey Mildway* (Rutgers University Press) by Philip L. Ralph, presents a Royalist gentleman and glimpses of the English scene from 1633 to 1652. *Hannah More and Her Circle* (Longmans), by Mary Alden Hopkins, centers on the 18th century religious writer.

The American legal light, Lloyd P. Stryker, has written of Thomas Erskine, English barrister, 1750-1823 (Doubleday). *The Life of Edward Fitzgerald* (Yale University Press), by Alfred M. Terhune, is a picture of the translator of *The Rubaiyat*. A sympathetic biography of Frank Harris is by E. Merrill Root (Odyssey Press). *Like Moonlight on Snow* (McBride) by John Hewlett, has as its subject the Bolivian tin king, Patino. A well reviewed work by Ralph Roeder is the two-volume *Juarez and His Mexico* (Viking).

TRAVEL

By Wilma Belden Fairchild
Research Assistant, American Geographical Society

GENERAL

Most of the travel books of 1947 were concerned with the Western Hemisphere, a condition that has been characteristic, understandably, of the past few years. Alaska is well-represented, indicating an increasing interest in the Territory from the point of view both of tourism and settlement. Latin America has grown in importance in the travel field as in many others, and the United States continues to be the subject of numerous books of a regional and interpretive character.

ALASKA, CANADA, LABRADOR

Two books that place emphasis on present conditions and future opportunities in Alaska are Edward A. Herron's *Alaska: Land of Tomorrow* (Whittlesey House) and J. B. Caldwell's *Introducing Alaska* (Putnam). The well known Canadian anthropologist, Marius Barbeau, has provided in *Alaska Beckons* (Caxton) a great deal of interesting material on the Asiatic beginnings of Alaskan Indian culture. *We Live in the Arctic* (Little, Brown) is the very readable account of Constance and Harmon Helmericks' winter sojourn in a cabin at the junction of the Kutuk and Alatma Rivers. In *The Flying North* (Macmillan) Jean Potter pays tribute to the "bush pilots" of Alaska and to the service they have rendered the Territory by their exploits. Murray Morgan's *Bridge to Russia* (Dutton) supplies welcome information on the history and character of the Aleutians. *Raw North* (Barnes) by Charles E. Gillham is an entertaining account of the author's travels through western Arctic Canada and Alaska, and more particularly of the people he met and came to know. A. R. Horr has written in *The Log of the Schooner Bowdoin* (World) an informal record of a cruise along the Labrador coast in Commander Macmillan's well-known vessel. The crew, in this instance, was largely made up of business men, all amateur seamen. Turning to the south and west, Florence Page Jaques' *Canadian Spring* (Harper) deals delightfully with a motor trip made by the author and her artist-naturalist husband through the western provinces of Canada in search of wildlife. Mr. Jaques' excellent drawings illustrate the book.

UNITED STATES REGIONAL SERIES

Only one newcomer to the now famous American Guide Series appeared in 1947. This was *Ghost Towns of Colorado* (Hastings House), a slim but colorful addition to the series. *Illinois: A Descriptive and Historical Guide* (McClurg), *Michigan: A Guide to the Wolverine State* (Oxford), and *San Francisco: The Bay and Its Cities* (Hastings House) were revised and reissued during the year. The eighth volume in the American Lakes Series, written by Dale L. Morgan, concerns the lore and landscape surrounding *The Great Salt Lake* (Bobbs-Merrill). In *The Connecticut* (Rinehart), a volume in the Rivers of America Series, Walter Hard has interpreted the present in the light of the past to provide a portrait of "this truly Yankee stream." In the same series, Marjorie Stoneman Douglas' *The Everglades: River of Grass* (Rinehart) appeared concurrently with the dedication of the area as America's newest national park.

Homer Croy's *Corn Country* and Donald Day's *Big Country: Texas* are two delightful additions to the American Folkways Series published by Duell, Sloan, and Pearce. *The Sierra Nevada: The Range of Light* (Vanguard) continues the American Mountain Series, edited by Roderick Peattie. To the Look at America Series, initiated in 1946 by the publication of a large and beautiful volume of the same title, the editors of *Look Magazine* have contributed four books of smaller format but of equal quality. These are *New England* (in collaboration with Mary Ellen Chase), *The Central Northwest* (in collaboration with Wallace Stegner), *The South* (in collaboration with David L. Cohn), and *The Southwest* (in collaboration with Paul Horgan). Each volume admirably fulfills its expressed function as "A Handbook in Pictures, Maps and Text for the Vacationist, the Traveler, and the Stay-at-Home." The series is published by Houghton Mifflin.

In addition to the continuation of former series as noted above, the current year has witnessed the inauguration of two new regional series. The American Trails Series, edited by Jay Monaghan and published by Bobbs-Merrill, has been planned "so that eminent historians can tell the story of the great natural routes that traced the design of a nation, tell it for the general reader without sacrifice of human interest, color or scholarship." In the inaugural volume, *The Wilderness Road,* Robert L. Kincaid has traced the history of the first route across the Appalachian barrier and indicated its influence in the pattern of American expansion. Mr. Monaghan has himself written the second volume, *The Overland Trail,* which describes the development of the great east-west route of migration across the continent.

With *Evergreen Land: A Portrait of the State of Washington,* Nard Jones initiates Dodd, Mead and Company's Sovereign States Series, books that are described by the publishers as "biographies of the various States of this country," with emphasis on the human characteristics—"the people, their folkways, their prejudices and their prides, the intangible things that distinguish the people of one State from their neighbors . . ."

GUIDEBOOKS AND HANDBOOKS

Guide to America (Public Affairs Press), edited by the travel director of the American Automobile Association, Elmer Jenkins, is "a treasury of information" about the states, their cities, parks, and historical monuments. Byron Steel's *Let's Visit Our National Parks* (McBride) contains in capsule form essential data on routes, accommodations, and points of interest. *Death Valley Handbook* (Duell, Sloan and Pearce), by George Palmer Putnam, provides pertinent facts on the climate, plants, birds, mammals, and rocks of one of our most colorful tourist meccas; it supplements Mr. Putnam's earlier regional study, *Death Valley and Its Country* (American Folkways Series, Duell, Sloan and Pearce, 1946). An elaborate and helpful guide to the west is Fred Bond's *Westward How* (Camera Craft Publishing Co.), of which the subtitle gives a fair indication of the contents: "How, Where, and When to Go, What to See, and How to Shoot It." The last phrase refers to technical advice on photography; the book is lavishly illustrated with the author's photographs.

INTERPRETIVE PUBLICATIONS

Those who accept the premise that New England is a state of mind will find pleasure in Zephine Humphrey's *A Book of New England* (Howell, Soskin), which includes essays on such favorite institutions as town meetings, maple sugar, ships, and weather. A number of paintings by the marine artist, W. N. Wilson, has been reproduced, six in full color, in *Along the Maine Coast* (Whittlesey House); the accompanying text was written by Dorothy Mitchell. Turning to the south, Samuel Chamberlain has captured the beauty and serenity of the Old Dominion in two photographic volumes, *Behold Williamsburg* and *Springtime in Virginia* (both Hastings House). Harnett T. Kane's *Natchez on the Mississippi* (Morrow) evokes the charm and discusses the cultural heritage of that lovely city. In *The World Grows Round My Door* (Scribner) David Fairchild describes his Florida home and the plants that surround it—flowers and trees collected in the course of 50 years of plant exploring throughout the world.

One of our least known and most interesting states is the subject of two books: John Gould Fletcher's *Arkansas* (University of North Carolina Press) and Marguerite Lyon's *Hurrah for Arkansas* (Bobbs-Merrill). The former is a comprehensive interpretation of history and economy, the latter a gay and personal record of experiences; both are informative and entertaining. "A sound and lively volume" on the Hoosier state is John Bartlow Martin's *Indiana: An Interpretation* (Knopf).

The West, particularly California, is well represented. Joyce and Josef Muench have produced a photographic survey entitled *West Coast Portrait* (Hastings House) and also a similar record of Kings Canyon National Park, *Along Sierra Trails* (Hastings House). Another national park is the subject of *One Hundred Years in Yosemite* (University of California Press), by Carl Parcher Russell. *California in Our Time* (Knopf), by Robert Glass Cleland, recounts the history of the Golden State from 1900 to 1942. Oscar Osburn Winther's *The Great Northwest* (Knopf) is likewise historical in emphasis, covering Oregon and Idaho from Indian times to the present.

AMERICAN CITIES

"Profiles" of 22 cities, their traditions, character, and aspect, are included in *Cities of America* (Whittlesey House) by George Sessions Perry. Two slim pictorial volumes by Josef Muench portray *Salt Lake City* (Hastings House) and *San Francisco Bay Cities* (Hastings House). Ruby Fay Purdy's *The Rose City of the World* (Binfords and Mort) is at once a chronicle of and a guide to Portland, Oregon. *San Francisco Is Your Home* (Stanford University Press), by Samuel Dickson, is described as a kaleidoscope—"colorful history and biographical bits shaken up together to form the exciting patterns that are San Francisco, past and present."

WEST INDIES

Page Cooper's book on the Dominican Republic, *Sambumbia* (Caribbean Library), is "a picture of the island of Columbus as it is today and the people who are his heirs." Through her skillfully written vignettes of personalities, she has succeeded admirably in catching the spirit of the country as well as in producing many interesting facts about it. Another book on the human side is Melville J. and Frances S. Herskovits' *Trinidad Village* (Knopf), an anthropological study of Negro culture in the settlement of Toco.

MEXICO AND CENTRAL AMERICA

Hudson Strode's *Now in Mexico* (Harcourt, Brace) is "a selective recountal of various trips to different parts of the country made at intervals during the past eleven years." Those already familiar with Mr. Strode's ability to interpret foreign scenes and peoples will find the present volume a worthy successor to his earlier books. Another fine study of the country and its people is Herbert Cerwin's *These Are the Mexicans* (Reynal and Hitchcock). *You Must Go to Mexico* (Ziff Davis), by Cecil and Fred Carnes, is at once a helpful tourist guide and a humor-spiced narrative of a motor trip down the Pan American Highway.

Ralph Hancock's *The Rainbow Republics: Central America* (Coward-McCann), a volume in the Invitation to Travel Series, presents a great deal of useful tourist information in easily digestible form. In *Banana Paradise* (Stephen-Paul), Frances Emery-Waterhouse describes life in Siguican, a banana town in southern Guatemala, as she came to know it during several years' residence. Another interpreter of the Guatemalan scene is Jean Hersey, whose *Halfway to Heaven: A Guatemala Holiday* (Prentice Hall) combines background with anecdote to provide an engaging portrait of the country.

SOUTH AMERICA

A light-hearted volume that covers 13 countries from Mexico to Argentina is Oden and Olivia Meeker's *. . . And Points South* (Random House). Ainslie and Frances Conway spent five difficult but rewarding years in the inhospitable environment of the Galápagos Islands and recounted their experiences in *The Enchanted Islands* (Putnam). Two scientists' wives have written vividly of life in Colombia: Virginia Pearson, living in an oil company camp in the tropical lowlands, contended with ants, lizards, scorpions, and monkeys—in fact, *Everything but Elephants* (Whittlesey House); Nancy Bell Bates' domain is the small city of Villavicencio in the llanos region, which is *East of the Andes and West of Nowhere* (Scribner's). Peru and Bolivia are illuminated through anecdote, fact, and description in *Lands of the Andes*

(Coward-McCann) by T. R. Ybarra, and Betty Sherbinin has performed the same service for *The River Plate Republics* (Coward-McCann), Paraguay, Uruguay, and Argentina. The "Yanqui" of Bailey Willis' *A Yanqui in Patagonia* (Stanford University Press) is the author himself, a distinguished geologist and a shrewd observer both of people and of nature. The book deals largely with the exploration of the "lake region" of westtern Argentina in the years 1910 to 1914.

EUROPE AND AFRICA

The travel literature for Europe is still sparse. However, two guide books for France appeared in 1947: Stuart Murray's *A Traveler's Guide to France* (Sheridan House) and Sidney Clark's *All the Best in France* (Dodd, Mead). Both offer useful tourist information. Another book that might be mentioned, although its emphasis is mainly political, is Maurice Hindus' work on Czechoslovakia, *The Bright Passage* (Doubleday). In it the author devotes a relatively extensive section to "a picture of the country and its people since liberation." In *The Reluctant Rescue* (Doubleday), Olivia Manning tells the story of Sir Henry M. Stanley's little-known and ill-fated expedition across equatorial Africa for the purpose of rescuing Emin Pasha.

NEAR EAST

Saudi Arabia (Princeton University Press) represents the distillation of K. S. Twitchell's 20 years of work and 20,000 miles of travel in this little known country and thereby constitutes a valuable contribution to regional literature of the Near East. The book contains three main sections—the geographical and cultural aspects of the country, its political and social development, and its position in world economy. Selma Ekrem gives her readers fascinating glimpses of *Turkey, Old and New* (Scribner). *Promised Land* (Harper) by Ellen Thorbecke is a lavishly illustrated survey of modern Palestine.

ASIA

In *The Quest* (Doubleday), R. V. C. Bodley sets forth reflections and observations stemming from his travels in southern and eastern Asia before the war. *Kingdom of Adventure: Everest* (William Sloane), edited by James Ramsey Ullman, is "a chronicle of man's assault on the earth's highest mountain, narrated by the participants." The journal of Dr. James Morrow, "agriculturist" of the Perry Expedition to Japan in 1853, is published for the first time in *A Scientist with Perry in Japan* (University of North Carolina Press), edited by Allan B. Cole. It contains illuminating notes on the plants, crops, and farming methods of the time. Mr. Cole also edited *Yankee Surveyors in the Shogun's Seas* (Princeton University Press), which presents the records of the United States Surveying Expedition to the North Pacific from 1853-1856, following Commodore Perry.

WORKS OF GENERAL SCOPE

An unusual and richly satisfying book is Robert Cushman Murphy's *Logbook for Grace* (Macmillan), a personal record of experiences aboard the whaling brig *Daisy* in the South Atlantic in 1912-1913. The human story of the voyage is told through excerpts from letters of the author to his wife. Dorothy Carrington's *The Traveler's Eye* (Pilot Press) is another distinctive book. It is a bird's eye view of the travel literature of seven centuries, presented by means of extensive quotations interspersed with critical commentary.

TRAVEL BIOGRAPHIES

For those whose taste combines a love of adventure with an interest in personalities, several recent travel biographies are noted here. George Palmer Putnam's *Mariner of the North* (Duell, Sloan and Pearce) is the salty biography of that well-known Arctic skipper, Captain Bob Bartlett. *Maya Explorer* (University of Oklahoma Press), by Victor Wolfgang Von Hagen, is the life of John

Lloyd Stephens, whose discovery of "the lost cities of Central America and Yucatán" a century ago laid the foundation for recent Mayan archaeology. Bradley Robinson's *Dark Companion* (McBride) tells the life story of Matthew Henson, the Negro who was with Peary at the pole.

CRITICISM AND BELLES LETTRES

By John Hite
Professor, Princeton University

THE NEW CRITICS

The literary criticism practiced by the "new critics" in the two decades prior to the recent war taught a generation of poets, scholars, and teachers the elementary discipline of reading a text. It will no doubt seem incredible to the future that such basic training was necessary for those who, in most cases, had long since set up shop as masters, not apprentices, in the trade of literary judgment. Yet the fact remains that most of the teachers and would-be critics had been so captivated by the historical approach, and so seduced by the false hope that at last they had found a sure and easy means of explaining away the troublesome mystery of art, that they turned from the text to the far simpler matters of origins and biography; they were like the architect who, in breaking ground for his first house, becomes interested in geology to the ultimate sacrifice of his client's hopes. It remained, therefore, for John Crowe Ransom, Alan Tate, Cleanth Brooks, and Robert Penn Warren, to mention one school of criticism, and such isolated individuals as T. S. Eliot, Yvor Winters, and R. P. Blackmur to return the attention of the reader to the text itself and to essential, not accidental, problems of judgment. History was interesting but largely impertinent, in the opinion of these new critics, and they concentrated their attention on the essential, not accidental, problems: What is a good line of verse? A good poem? Who are our best poets? and, most importantly, Why?

However, in thus setting themselves up as judges of the best poetry (the Metaphysicals, and in particular Donne), and in their strictures on certain bad poets and bad schools of poetry (in particular the Romantics), these critics managed to ignore the necessary basis in metaphysics and morals for such judgments. They were not sufficiently trained for the former, and the latter they wished to avoid, having before their eyes what they felt to be the wholly inadequate measurement of literature by the moral standards of their immediate predecessors in criticism, the neo-humanists Irving Babbitt and Paul Elmer More. The new critics restricted themselves (to borrow a subtitle from R. P. Blackmur) to essays "in craft and elucidation." It is extremely interesting, therefore, that in the publications of literary criticism for 1947, three members of the group named above, Yvor Winters, Cleanth Brooks, and Robert Penn Warren, are revealed in radical departures from or developments of attitudes proper to the previous period; and effort is made to recognize and establish a metaphysical and moral basis for literary judgment, a departure singularly appropriate to the post-war era.*

IN DEFENSE OF REASON

Yvor Winters' *In Defense of Reason* is a republication of his earlier work: *Primitivism and Decadence* (1937); *Maule's Curse* (1938); *The Anatomy of Nonsense* (1943); with a foreword and a new long essay, "The Significance of *The Bridge* by Hart Crane, or What Are We to Think of Professor X?" Throughout this work there runs a basic and important theme, which Winters himself terms moralistic but which he is careful to distinguish from over-simple or superficial didacticism. Winters insists that the act of the poet is an act of moral judgment; and in the lucid foreword to this volume he formally acknowledges that he is an absolutist, thus accepting the logical implications of his position. He lays strictures not only on the avowed relativist but also on that peculiar breed of fuzzy intellectuals (principally college professors) who attempt to shirk their intellectual and moral responsibility by never admitting to a position, yet at the same time continuing to make judgments and to act on an absolute basis.

---

* Yvor Winters, *In Defense of Reason*, The Swallow Press and William Morrow & Company, New York, 1947.
Cleanth Brooks, *The Well Wrought Urn*, Reynal & Hitchcock, New York, 1947.
Coleridge, S. T., *The Rime of the Ancient Mariner*, illustrated by Alexander Calder, with an essay by Robert Penn Warren, Reynal & Hitchcock, New York, copyright 1946.

He says: "It is popular at present to profess relativism and yet in important matters to act as if we were absolutists. Our ideas of justice, which we endeavor to define by law and for which wars are fought, can be defended only by invoking moral absolutism. Our universities, in which relativistic doctrines are widely taught, can justify their existence only in terms of a doctrine of absolute truth. The professor of English Literature, who believes that taste is relative yet who endeavors to convince his students that *Hamlet* is more worthy of their attention than some currently popular novel, is in a serious predicament, a predicament which is moral, intellectual, and in the narrowest sense professional, though he commonly has not the wit to realize the fact."

WINTERS' CRITICISM OF POE

Winters' position can best be illustrated by reviewing some of his criticisms of major American writers. For instance, he attacks what he calls "the bucolic innocence of the experts is Poe"; the contention is that as inheritors of the historical point of view, a point of view from which incidental material has a way of becoming as important as the main body of facts, we have tended to consider as first-rate these figures in our literature who have been the subject of vast amounts of "scholarship." Poe is shown up as obscurantist and non-intellectual in spite of his pretensions to the contrary; his intellectuality is all anterior to a poem, not in it. Winters feels that Poe's crossword-puzzle mind and superficial intellectuality, together with his unorientated emotionalism, shut him out from "that vast and solid region inhabited by the major literary figures of the world, the region in which human experience is understood in moral terms and emotion is the result of that understanding, or is seen in relationship to that understanding and so judged." In addition, if we understand the nature of Poe's confusion, we come closer to an understanding not only of his American contemporaries but also of the French Symbolists and the moderns as well.

HAWTHORNE

The strictures of Hawthorne, however, illustrate Winters' position even more clearly; he is able to contrast New England Calvinism, which was plain and comprehensive, however brutal, against the foggy post-Unitarianism and Romantic intellectualism of Hawthorne's own time. Thus, in the *Scarlet Letter*, the allegorist Hawthorne found the perfect material for his use in the story of the first generation Puritans, but once having written this allegory, in which sin was clearly defined in terms of Calvinism, Hawthorne proved to be incapable of handling a moral problem at all, that is, he talked about sin but did not really know what it was. This ignorance is evident in the *Marble Faun*, which is interesting but hardly successful, a manifestation of how far the 19th century intellect had strayed from the center of Christianity, particularly medieval Christianity, in which sin is a complex matter, not an absolute, and in particular not an act predestined and damned.

HENRY JAMES

The work of Henry James, although complete and successful in contrast to the incompletion and failure of Hawthorne, is vitiated by the fact that his characters attempt to make moral choices isolated from all qualifying criteria, a fact which has focussed attention of later readers and critics on the formal aspects of his art rather than on the weight of its content, which tends to etherialize and disappear. But, Winters found the curse of the Calvinistic heritage most clearly at work in Henry Adams, who, although himself a man of the highest character, was unable to justify any principle of action; and "though an historian of great learning and of high academic distinction, he transformed the Middle Ages by a process of subtle falsification, into a symbol of his latter-day New England longing; in which, though a stylist of great power and precision, he propounded the aesthetic theory that modern art must be confused to express confusion . . ." Adams' theory of history became a symbol of his own despair.

HART CRANE AND EMERSON

The culmination of the Winters doctrine is propounded in his essay on the significance of Hart Crane's *The Bridge,* in which the given argument is trained on the most important figure of American romantic thought, Emerson. As in the attack on Adams, Winters points out that it is not enough to read or teach Emerson as a man who wrote interestingly and brilliantly about philosophic matters, but rather that Emerson must be criticized for the irresponsibility of his thinking, that his doctrines (if taken seriously) lead to moral breakdown and confusion, and that Emerson, like Adams, was saved personally from this sort of breakdown by the momentum of his heritage, his character. But Whitman, who took over Emerson's ideas wholesale, was not saved, and Hart Crane, who followed Whitman, tried to live by these ideas and as a result committed suicide. One might reply, of course, that it was not Emerson's fault that Crane committed suicide, but that is not Winters' point. Crane's death is but a symbol of another kind of death: the fact that *The Bridge* fails as a work of art. This is the prime instance of a man of great talent and intellect being so completely of his age, so much the result of post-romantic muddleheadedness, that not only was his life ruined on the personal level but his art as well, that there was a kind of suicide in his poetry, the suicide of the conscious intelligence, the decadence of the moderns.

THE WELL WROUGHT URN

In *The Well Wrought Urn,* Cleanth Brooks has gathered together and issued in book form ten of his essays in criticism. However, in the light of the discussion of the Winters' volume, this book is more interesting for its appendices than for the essays themselves. The appendix entitled, "Criticism, History, and Critical Relativism," reveals Brooks' awareness that he can not go on forever making literary judgments without the foundation of a philosophical position. Like Winters, he cannily reduces the critical relativists to the absurd position of judging each poem in terms of the poet's own sensibility; he points out, that critical absolutism is necessary, for unless a formal position is taken and maintained by critics, poetry itself will disappear and it will become necessary to accept anything as poetry. Brooks adds that this critical absolutism must embrace a system tremendously and artificially complex; and then rather improbably attacks Winters' position as implying adherence to a particular religious and philosophical dogma. But Brooks can not hold his own position without meeting the same difficulty. One can not talk about absolutism and then scorn the current supply. The proper and only meaningful answer to this problem for the Occidental is a return to the tremendously artificial complexity of Christianity, to the often neglected but ever-present rationale of Christian morality.

In the essays proper, Brooks continued his reading of certain specific poems to illustrate his contention that all language, and poetic language in particular, communicates on more than one level. His term for this multi-communication is "paradox," that is, the poet is not only saying what the words mean when they are examined literally but also he is probably saying the opposite. Brooks' readings of poems has always been most interesting; he is a good reader and often turns up meanings that many had missed, but he is so anxious to avoid what he calls the heresy of paraphrase (a single explicit reading of a poem) that the discussions of the poems are too long drawn out and circuitous. It is rewarding though to find this new critic moving out of the 17th century; besides the essays on Donne, Shakespeare, Herrick, and Milton, there are discussions of Pope, Gray, Wordsworth, Keats, Tennyson, and Yeats, an extended use of his method which should result in re-evaluations in eighteenth and nineteenth century poetry.

THE RIME OF THE ANCIENT MARINER

Robert Penn Warren's essay on Coleridge's *Rime of the Ancient Mariner* is more satisfactory as a reading of a poem than are any of the elucidations in the Brooks volume. Warren is substantially in agreement with Brooks on the matter of the multiple meanings inherent in a poem; he contends that the *Rime* is first of all a poem of "mòrals in a sacramental universe"; secondly, it is a poem of "pure imagination." In connection with the first meaning, Warren shows that Coleridge accepted the idea of Original Sin as a mystery, and that symbolically the ancient mariner committed a murder, that is, the crime of killing the albatross was committed against God, not against man. This act of the mariner's in its gratuitousness and in its perversity is not, therefore, the Aristotelian *hamartia,* the flaw in the tragic hero, but is rather like the Fall itself in being both timeless and motiveless. Warren, in developing this meaning, breaks the poem open by drawing attention to the special use in it of sunlight and moonlight to set the contrasting tones, and the significance of each kind of light as indicating what is happening or about to happen at any given moment. The ancient mariner himself is the everlasting wanderer over the face of the earth, the man who carries about within himself man's imperfection, his original sin.

On the second level of meaning, that of pure imagination, Warren is saying that the *Rime of the Ancient Mariner* is not just a pretty thing, a perfect imaginative insight, but rather that this poem represents Coleridge's basic thesis: that "deep thinking is attainable only by a man of deep feeling, and that all truth is a species of revelation." Warren feels that this idea of Coleridge's is his great contribution to modern thought; and he explains it further in adding that the truth of a work of art is implicit "in the poetic act as such, that the moral concern and the aesthetic concern are aspects of the same activity, the creative activity, and that this activity is expressive of the whole mind."

Since the *Rime* was written out of this belief and about this belief, Warren feels that the moral values and the aesthetic values merge, that the poem essentially is about "the unity of the mind and the final unity of values, and in particular about poetry itself." Unfortunately, neither Coleridge nor Warren can be allowed to officiate at this wedding of morality and aesthetics, since as we have seen above this is just the sort of thing which cancels out all values, and one is left finally with that prize piece of romantic nonsense that truth is beauty and beauty is truth. That the art fact is, in a way, an example of the truth of nature, that is, that the work of art is as true as a blade of grass is true is a correct and obvious enough statement, but having said this, the critic must not congratulate himself on having uttered a profundity; the substitution of one mystery for another only appears meaningful; actually, one has said nothing about either art or truth. Warren's analysis is, we feel, correct; the error is Coleridge's, and Warren is implicated only so far as he agrees with his own findings.

In general, though, the new critics are to be commended for having come to the position of realizing that they must take a stand and that the stand can not be a simple one; yet, with what appears to be the exception of Yvor Winters, the men known as the new critics lack the background and training for the formulation of a Christian standard, which properly must be left to philosophers, and particularly to the theologians. It is good to be able to record, however, that the intellectuals have been brought face to face with their choice and that they recognize it clearly as such, although the non-religious backgrounds of most of them make them a little shy as yet of announcing their Christianity and of accepting the heritage of the superb *architectonike* of its rationalism.

ENGLISH LANGUAGE AND LITERATURE

By Donald Nelson Koster

Assistant Professor, Adelphi College

GENERAL

Of course many of the most scholarly works of the present day are being published—as indeed they should be—by the university presses. The fact remains, and deserves underlining, that a good many others are being printed under the mark of one or another of the commercial publishing houses. The year 1947 saw no falling off in this respect.

Limitations of space make this survey necessarily selective. Readers are therefore advised to consult, upon its appearance, the Supplement to the *Publications of the Modern Language Association* (*PMLA*),* which will contain a quite complete bibliography.

ENGLISH LANGUAGE

Joseph Jones and E. B. Atwood provided a "Bibliography of 1946 Works on Present Day English and Phonetics" (*AS*). In *The Use of Language* (Crofts), Henry F. Pommer and William M. Sale, Jr. presented a sound discussion of the nature of language and largely accomplished the purpose of their book, which was to set forth the requirements of a clear and accurate prose style.

Albert Guerard in a provocative article evolves "Ten Levels of Language" (*ASch*). They follow: 1. Below consciousness, language as sheer reflex: the cry, the call, the groan, the sigh; 2. Subconscious speech: unformed sentences, deformed words; Joyce's *Ulysses* is used as an example of this in literature; 3. The Barely Conscious: the colloquial level of everyday speech; 4. Standard speech: good plain vernacular, without pretension; 5. Literary style: the zone of the elaborate, the lofty, the poetic; 6. Literary language totally different from the vernacular; 7. The "artificial"; 8. "Individual" language beyond the range of mere communication; 9. Free creation—as in *Finnegan's Wake;* 10. Silence.

---

* Periodicals frequently referred to in the present survey are cited under the following abbreviations: *PMLA*, *Publications of the Modern Language Association of America; MP*, *Modern Philology; JEGP*, *Journal of English and Germanic Philology; SP*, *Studies in Philology; PQ*, *Philological Quarterly; ELH*, *English Literary History; HLQ*, *Huntington Library Quarterly; SAB*, *Shakspere Association Bulletin; MLQ*, *Modern Language Quarterly; JHI*, *Journal of the History of Ideas; ASch*, *The American Scholar; KR*, *The Kenyon Review; YR*, *The Yale Review; AS*, *American Speech; AL*, *American Literature.*

"The Orthography of John Bate of Sharon, Connecticut (1700-1784)" (*AS*) is a monograph by Harold Whitehall in which a detailed study is made of the interestingly original spelling of the first farrier and blacksmith of Sharon, whose recently discovered Account Book serves as the basis for the study.

The thesis that Latin is becoming a dead language even among the learned, who now hesitate to use a Latin word or phrase because they are not sure how to pronounce it, was advanced by Thomas Pyles in "The Pronunciation of Latin in English: A Lexicographical Dilemma" (*AS*). He maintains that the pronunciation of learned loan words, foreign words, and phrases from Latin is now in a transitional stage, wherein lurk many hybrid pronunciations. Esther K. Sheldon in "Walker's Influence on the Pronunciation of English" (*PMLA*) suggested that John Walker, eighteenth century lexicographer, because of his careful, logical systematization, was popular with succeeding dictionary makers and with the general public as well. The contention is made that he was the greatest single influence on English pronunciation, particularly in its American branch.

Arthur E. Hutson in "Gaelic Loan-Words in American" (*AS*) discussed words from Scottish and Irish Gaelic brought into American speech largely during the nineteenth century in the great migration (some are *puss, shebang, shenanigan, slug, slew, smithereen, shanty, hooligan*), while A. D. Weinberger gathered "Some Data and Conjectures on the History of *Hubba-Hubba*" (*AS*). "Gullah in the Stories and Novels of William Gilmore Simms" (*AS*) gave the results of an examination by J. Allen Morris of 16 Simms novels, of which nine were found to contain examples of the Gullah dialect of the Carolina Negroes.

The American Thesaurus of Slang, edited by Lester V. Berrey and Melvin Van Den Bark, was published (Crowell) in a revised edition, with a supplement of Teen Talk, Jive Jargon, and Military Slang. Delbert W. Hamilton added to the studies of military slang with his "Pacific War Language" (*AS*), a glossary of Army slang based on notebooks which he kept in the South Pacific, the Philippines, and Japan from 1944-1946.

J. R. Hulbert in "On the Origin of the Grammarians' Rules for the Use of *Shall* and *Will*" (*PMLA*) showed that there were writers before 1762 (Lowth's *Grammar*) who preferred *shall* for expressing simple futurity in the first person in independent clauses, *will* in the second and third—specifically, the authors of letters written in the period from 1650 on.

The year saw the publication of an extremely fine new dictionary, *The American College Dictionary* (Random House), edited by Clarence L. Barnhart. A very useful all-purpose volume of desk size, it has all entries alphabetically arranged, thereby doing away with the necessity for separate sections, and is based on standard American rather than British usage. Its principal disadvantage is the absence of a thumb index.

OLD ENGLISH

Originally scheduled for publication in 1946, Eleanor Shipley Duckett's *Anglo-Saxon Saints and Scholars* (Macmillan) finally made its appearance. It proved to be a book well worth waiting for, an altogether scholarly study of the place and significance in their times of four leading men of God and letters: Aldhelm of Malmesbury, Wilfrid of York, Bede of Jarrow, and Boniface of Devon.

Erika von Erhardt-Siebold offered as a solution to "Old English Riddle No. 57" (*PMLA*) the idea that the bird referred to in the riddle is the jackdaw. She established O.E. *cā as the popular onomatopoeic name for that bird in Anglo-Saxon England. "The Vocabulary of the Old English Poems on Judgment Day" (*PMLA*) was studied by Robert J. Menner, who examined the selection of words in order to determine the original dialect of Old English poems later than Cynewulf. Menner concluded that Judgment Day I is Anglian in origin, whereas Judgment Day II is clearly Saxon.

MIDDLE ENGLISH AND CHAUCER

John J. Parry's "A Bibliography of Critical Arthurian Literature for the year 1946" (*MLQ*) was of unquestionable assistance to scholars in the field. Geoffrey B. Riddehough delved into "A Forgotten Poet: Joseph of Exeter" (*JEGP*), analyzing the *Bellum Trojanum,* written in the ninth decade of the twelfth century and known to Chaucer.

"Chaucer's Final -E in Rhyme" (*PMLA*) by James G. Southworth advanced the hypothesis that final -e had disappeared from the spoken language earlier than we have hitherto believed, that Chaucer was in no way archaic, and that he had a subtler ear for delicate rhythms and poetic form than many have been willing to grant him. Robert A. Pratt's "Chaucer's Use of the *Teseida*" (*PMLA*) was a study of the English poet's use of Boccaccio's poem and stated that it formed the basic material of the *Knight's Tale* and was the source of numerous Chaucerian passages.

AGE OF ELIZABETH

A. Philip McMahon in "Sir Philip Sidney's Letter to the Camerarii" (*PMLA*) gives the full text of a letter in Latin from Sidney to the sons of Joachim Camerarii in which he promised to help them publish their father's works, while Helen A. Kahin in "Jane Anger and John Lyly" (*MLQ*) suggests that Lyly's *Euphues His Censure to Philautus* incited *Jane Anger her protection for women,* a reply to a volume Jane considered defamatory to her sex.

That Guicciardini was the modern historian most admired by Sir Francis Bacon is the contention of Vincent Luciani in "Bacon and Guicciardini" (*PMLA*), which states that Bacon consulted the Italian's *Storia* more frequently than any other modern European history for illustrative instances of political behavior and that he used it as a model for his own *History of Henry VII*. "The Relation of Sherry's *Treatise of Schemes and Tropes* to Wilson's *Arte of Rhetorique*" (*PMLA*) by G. J. Engelhardt reveals the extent to which Wilson's greater work benefited from the existence of the earlier work of Sherry, and "A History of Fairfax Criticism" (*PMLA*) by Charles C. Bell examines the varied contemporary and succeeding judgments of Edward Fairfax, Elizabethan poet and translator.

Two Marlowe items were provided by Paul H. Kocher and Raymond A. Houk, the former in "Contemporary Pamphlet Backgrounds for Marlowe's *The Massacre at Paris*" (*MLQ*), showing that the dramatist's dependence on the pamphlet literature of the time was great in both the action and characterization of his crude topical drama, and the latter in "*Doctor Faustus and A Shrew*" (*PMLA*) supporting the hypothesis of a common source for Marlowe's tragedy and the anonymous *The Taming of A Shrew.*

JONSON

According to Henry L. Snuggs, study of the whole Induction to *Every Man Out of His Humour* "reveals that—contrary to the prevailing opinion—[Ben] Jonson intended to portray affected and eccentric humours which are not in accord with his own definition." The comic humours of seventeenth century drama are, then, the pseudo-humours of affection and eccentricity. This point of view is presented in "The Comic Humours: A New Interpretation" (*PMLA*). Allan H. Gilbert in "The Italian Names in *Every Man Out of His Humour*" (*SP*) says that Jonson gave his important characters Italian names because he wished thereby to tell the audience something about them and also that Florio's *A Worlde of Wordes* (1598), an Italian-English dictionary, was known to many of Jonson's readers and could be consulted by them with illuminating results. "Ben Jonson's 'Censure' of Rutter's *Shepheards Holy-day"* (*MP*) by Freda L. Townsend concludes that in Jonson's eyes Rutter had achieved a well-made play, although it defies the principle of unity of plot, and that Jonson's dramatic laws were probably original in their formulation and had little to do with ancient prescriptions. The final Jonson item was Ralph Nash's "The Comic Intent of *Volpone*" (*SP*), which argues that the serious is subordinated in the play and that Jonson was writing primarily to amuse his audience, not to give them a lesson in morals.

SPENSER

Brief accounts of the prominent officials of the province of Munster at the time Spenser was deputy clerk of the council are furnished by Alexander C. Judson in "Spenser and the Munster Officials" (*SP*), while Paul E. McLane in "Spenser's Morrell and Thomalin" (*PMLA*) presents in detail the grounds for the poet's presumed dislike of Bishop Aylmer and also suggests that Dr. Thomas Cooper, bishop of Lincoln between 1571 and 1584, is a more probable Thomalin than any Puritan would be. "Belphoebe's Misdeeming of Timias" (*PMLA*), by Allan H. Gilbert, provides an interpretation of the story of Timias, Arthur's Squire, in *The Faerie Queene*, and "Spenser's 'Faery' and 'Fairy'" (*MLQ*), by Sverre Arestad, distinguishes between the two senses in which Spenser used the term—human being and fairy—suggesting the consequent elucidation of *The Faerie Queene* that results from such a distinction.

SHAKESPEARE

A valuable "Bibliography of Shakesperiana for 1946" (*SAB*) was compiled by Samuel A. and Dorothy R. Tannenbaum, and four excellent books on the great dramatist were published during the year. Charles Norman, author of *The Muses' Darling*, a competent biography of Marlowe, did an equally good job on *So Worthy a Friend: William Shakespeare* (Rinehart). Although he romanticizes at times, his foundation is sound and his book most readable; Shakespeare the man and the dramatic poet emerges from its pages. A more scholarly study was *As They Liked It* (Macmillan), by Alfred Harbage, an engaging essay in which Professor Harbage emphasizes that Shakespeare accepted and worked within the prevailing Christian moral code of his age. *Prefaces to Shakespeare, Vol. 1* (Princeton), by Harley Granville-Barker, is the first American edition of the *Prefaces*, which were written over a 20-year span, and *Comic Characters of Shakespeare* (Macmillan), by John Palmer, is the first American printing of an English work which contains five studies—of Berowne [Biron], Touchstone, Shylock, Bottom, and Beatrice and Benedick.

Lily B. Campbell, in "Bradley Revisited: Forty Years After" (*SP*), evaluates Bradley's *Shakespearean Tragedy* (1904) and finds his criticism warped by his nineteenth century mind.

Articles treating with individual plays are several. In "Much Ado About an Unpleasant Play" (*SAB*), E. J. West analyzes his antipathy to *Much Ado About Nothing*. He considers the plot unsavory and joins Shaw in condemning it as "peculiarly venomous." Raymond A. Houk, in "Shakespeare's *Shrew* and Greene's *Orlando*" (*PMLA*), contends that parallels with Robert Greene's play support the theory that Shakespeare in 1592-93 may have composed preliminary sketches for *The Taming of the Shrew*, while Michel Poirier in "Sidney's Influence Upon *A Midsummer Night's Dream*" (*SP*) attempts to show that Shakespeare made considerable use of Sidney's *Arcadia* and *Defence of Poesie* in the writing of his play. John E. Hankins, while contending in "Caliban the Bestial Man" (*PMLA*) that Caliban is Shakespeare's most original character, states that "even he has literary forebears." "Symphonic Imagery in *Richard II*" (*PMLA*) by Richard D.

Altick is a study of the tragedy which concludes that it is made more moving by the style, "half rhetorical, half lyrical," in which it is told.

"Character in Relation to Action in *Othello*" (*MP*) by Moody E. Prior attempts to establish the reciprocal relationship between character and action in Shakespeare's major tragedies and uses *Othello* as an illustration. Depreciated is the criticism which reduces Shakespeare's characters to simple linear proportions. That Shakespeare in his treatment of the Roman attitude toward Antony and Cleopatra may have been influenced by Horace's "Cleopatra Ode" and his Epode IX and that his characterization of Cleopatra owes much to the Latin poet is the burden of Perry D. Westbrook's "Horace's Influence on Shakespeare's *Antony and Cleopatra*" (*PMLA*). "Mr. Wilson's *Henry IV*, Parts I and II" (*SAB*) by R. W. Babcock is an analysis of J. Dover Wilson's new *Henry IV* texts, which the writer terms "somewhat conservative and distinctly deferential" and quite disappointing. Paul A. Jorgensen in "Accidental Judgments, Casual Slaughters, and Purposes Mistook: Critical Reactions to Shakespeare's *Henry the Fifth*" (*SAB*), examines much of the critical opinion on Henry and shows that a significant difference exists between Shakespeare's professed intention to idealize and glorify his hero and the repulsion felt toward him by most critics because of his "gross vices," his snobbery, his efficiency, and his worldliness.

SEVENTEENTH CENTURY

That Donne had a persistent, even life-long wish to die, and that a full understanding of that wish throws much light on his temperament, work, and philosophy, is the thesis of "The Death Wish of John Donne" (*PMLA*) by Donald Ramsay Roberts. Phillip Shaw states "The Position of Thomas Dekker in Jacobean Prison Literature" (*PMLA*) is one of writing or collaborating on about half of the entire output of Jacobean works describing London's prisons, while Willa McClung Evans in "Lovelace's Concept of Prison Life in *The Vintage to the Dungeon*" (*PQ*) tries to show that the concept of such life mirrored in that work was not the poet's unconsidered reaction to his immediate environment when he was committed to the Gatehouse in 1642, but the adaptation of certain scenes and ideas set forth in Cartwright's *The Royall Slave*. Grover Smith's "The Influence of Sir John Hayward and of Joshua Sylvester upon William Drummond's *Cypresse Grove*" (*PQ*) establishes the indebtedness of Drummond's essay to Hayward's *Sanctuarie of a Troubled Soule* and to Sylvester's *Memorials of Mortalitie*. Through copious use of parallel passages, John S. Weld in "W. Bettie's *Titana and Theseus*" (*PQ*) tries to prove that Bettie's little known euphuistic novel was a borrowing in large measure from Green's *Pandosto*, the source also of *A Winter's Tale*.

"The Latin Element in Henry Vaughan" (*SP*) by Philip Macon Cheek praised Vaughan as a man of wide and varied erudition, who, as a student of the Latin classics, found inspiration in them for his secular poetry and his prose. Ruth Wallerstein's "On the Death of Mrs. Killigrew: The Perfecting of A Genre" (*SP*) was a close consideration of Dryden's early elegy on Hastings and his mature ode *To the Memory of Mrs. Killigrew* as revealing the poet's evolution out of the dying metaphysical age into full neo-classicism without any dimming of his sense of the English tradition. George B. Parks in "John Evelyn and the Art of Travel" (*HLQ*) examined the contribution of Evelyn's European travel to making him the savant he was. And in "The Jonsonian Tradition in the Comedies of Thomas D'Urfey" (*MLQ*) C. B. Graham's scrutiny of D'Urfey's 20 comedies showed that D'Urfey added materially to the list of allusions to Jonson in the Restoration Period; that he portrayed humour-characters, some closely resembling well known Jonsonian types; and that ten of his comedies afford examples of episodic humour-study.

MILTON

A somewhat smaller amount of Miltonic study than usual was published during 1947. Ben Gray Lumpkin in *"Fate in Paradise Lost"* (*SP*) observed that there are two opposed meanings of the word "Fate" in Milton's great epic: on the one hand, a divine decree or the will of God; and on the other, an active, blind force superior to and controlling God. In his "Milton's *Lycidas* and Two Latin Elegies by Giles Fletcher, The Elder" (*SP*), Warren B. Austin commented upon the probable influence of Fletcher's *Adonis* and *De Obitu Clarissimi Viri* (an elegy on Walter Haddon, the great Ciceronian) on Milton's poem. "Milton's 'Brief Epic'" (*SP*) by Charles W. Jones was an explanation, in the light of Milton's reading, why Milton termed the Book of Job an "epic" in his *Reason of Church Government,* while Edward S. LeComte's "Milton's Attitude towards Women in the *History of Britain*" (*PMLA*) was a study of the first four books of the History which found Milton speaking out on the inferiority and proper subjection of women. Paul Bunyan Anderson in "Anonymous Critic of Milton: Richard Leigh? or Samuel Butler?" (*SP*), argued that Butler rather than Leigh was the author of the three anonymous pamphlets containing the most cogent criticism of Milton put in print by any of his contemporaries: *The Character of the Rump, The Census of the Rota upon Mr. Milton's Book, Entituled, A Ready and Easie Way to Establish a Free Commonwealth,* and *The Transproser Rehears'd.*

EIGHTEENTH CENTURY POETS

"The Poetry of Thomas Gray" (*YR*) by Lord David Cecil constituted an enthusiastic re-appraisal of Gray's poetry, through which Gray is said to "show himself as much an individual as Blake or Byron."

Two volumes on Blake appeared in 1947: *A Man without a Mask* (Transatlantic Arts), a sociological approach by J. Bronowski to the poetry of Blake, and *The Portable Blake* (Viking) edited by Alfred Kazin, whose introduction sums up the poet as "a Christian who hated the churches" and "a revolutionary who abhorred the materialism of the radicals."

Wallace Cable Brown in "Johnson As Poet" (*MLQ*) refuted the notion that Johnson wrote his poetry "with his left hand." He maintained that *The Vanity of Human Wishes,* in particular, is one of the great poems of the language and reveals its author as a master of the heroic couplet.

EIGHTEENTH CENTURY PROSE WRITERS

Dr. Johnson's famous biographer, James Boswell, commanded a fair share of attention in 1947. A full length biography of him, ably and accurately written, was produced by D. B. Wyndham Lewis, entitled *The Hooded Hawk: or, The Case of Mr. Boswell* (Longmans, Green), while *The Portable Johnson and Boswell* (Viking) was liberally Boswell and provided a good treatment of Boswell's technique as a biographer by editor Louis Kronenberger. "Boswell's Interviews with Gottsched and Gellert" (*JEGP*) by Daniel V. B. Hegeman was the record of Boswell's brief association with the two Leipzig professors as found mostly in his diaries.

A book based on solid research, yet entertainingly written, is Mary Alden Hopkins' *Hannah More and Her Circle* (Longmans, Green). Hannah More was one of Dr. Johnson's special pets and was pronounced by him to be "the most powerful versificatrix in the English language." Her religious tracts sold by the millions, and she numbered Walpole, Wilberforce, Zachary Macaulay, and John Wesley among her friends. Ralph M. Wardle's "Mary Wollstonecraft, *Analytical* Reviewer" (*PMLA*) traced the development of Mary's mind through the course of her hundreds of reviews for the *Analytical,* and Austin Wright in "The Varacity of Spence's *Anecdotes*" (*PMLA*) after examination of the character, reputation, and methods of the author concluded that the *Anecdotes* may be accepted as a predominantly veracious record of what the compiler actually heard. In "Neo-Classical Criticism of the Ode for Music" (*PMLA*), Robert M. Myers expounded the ten distinct qualities required by neo-classical critics of any perfect ode for musical setting.

Oskar Seidlin in "Laurence Sterne's *Tristram Shandy* and Thomas Mann's *Joseph the Provider*" (*MLQ*) suggested a spiritual affinity between the two authors. According to his view, both possess perfectly the attitude of irony, think similarly on the question of identity of space, of time, of individuality, and are met in wit. Two Fielding items are Robert M. Wallace's "Fielding's Knowledge of History and Biography" (*SP*), which concludes that examination of the novelist's education, library, and periodicals reveals that he was not concerned primarily with the Greek and Latin epic poets and critics but was inclined more strongly to the historians and biographers, and Arthur L. Cook's "Henry Fielding and the Writers of Heroic Romance" (*PMLA*), which discovers interesting similarities in principles between Fielding and the writers of heroic romance, such as Mlle. de Scudéry.

WORDSWORTH AND COLERIDGE

There are lone items for Wordsworth and Coleridge. In "Milton's Influence on Wordsworth's Early Sonnets" (*PMLA*) Bard McNulty contends that Wordsworth acknowledged a greater debt to Milton than he owed, and in "Hartley, Pistorius, and Coleridge" (*PMLA*), Hoxie N. Fairchild shows a relationship between the poet's *Religious Musings* and Hartley and Pistorius.

BYRON

The most considerable Byron contribution of 1947 is *John Bull's Letter to Lord Byron* (Oklahoma) edited by Alan Lang Strout, in which the text of the famous letter is printed along with an extended introduction that treats the background in full, gives the proof of John Gibson Lockhart's authorship, and discusses Lockhart's attitude toward Byron. T. G. Steffan published two articles, "The Byron Poetry Manuscripts in the Library of the University of Texas" (*MLQ*), a detailed description of the manuscripts, and "Byron At Work on Canto I of *Don Juan*" (*MP*), an examination of the letters of Byron and his circle, of the manuscript, and of various psychological forces that controlled composition. Bertrand Evans in "Manfred's Remorse and Dramatic Tradition" (*PMLA*), expresses the belief that Byron followed the technique of the Gothic playwrights who preceded him, but extended it to the very end of his drama, thereby motivating his hero's remorse without impeaching Manfred as hero.

KEATS

An important volume for students of English Romantic poetry is *Keats and the Daemon King* (Oxford) by Werner William Beyer. The main chapters examine in detail the influence of the German writer Christoph Martin Wieland on Keats' poetry. Considering "The Meaning of 'Fellowship with Essence' in *Endymion*" (*PMLA*), Newell F. Ford holds that this obscure phrase and the passage in which it is found comprise a young poet's description of imaginative "empathy." Clarence D. Thorpe in "Keats and Hazlitt: A Record of Personnal Relationship and Critical Estimate" (*PMLA*) finds the relationship between the two men to have been one of mutual respect and friendship, Keats' opinion of Hazlitt never diminishing, as it did with so many other contemporary writers.

SHELLEY

A decided boon to Shelley scholars is the publication of *Mary Shelley's Journal* (Oklahoma), edited by Frederick L. Jones. The book admirably supplements Professor Jones' two-volume edition of Mary Shelley's letters, which appeared a few years ago. Two other contributions by the same scholar are "Shelley's *On Life*" (*PMLA*) and "The Vision Theme in Shelley's *Alastor* and Related Works" (*SP*). The first states that the fragmentary essay *On Life* is very significant because it is the prose basis for the *Hymn to Intellectual Beauty,* is saturated with the influence of Wordsworth, and contains Shelley's first definite announcement of his rejection of a materialistic philosophy and adoption of a spiritual "intellectual system." The second tries to present a clear picture of the vision theme used by the poet in *Alastor* and other works, and of its place in his life and development. Evan K. Gibson in *"Alastor:* A Reinterpretation" (*PMLA*) contends that past critics of the poem have erred chiefly in overpersonification of the word *spirit.* "The Meaning of Shelley's *Mont Blanc*" (*PMLA*), by I. J. Kapstein, is an analysis of the poem which concludes that with it and subsequent to it, one discovers in Shelley's work his steadily increasing confidence in "the epistemology of idealism."

NINETEENTH CENTURY PROSE

"Victorian Bibliography for 1946" (*MP*), edited by Austin Wright, lists the noteworthy publications for that year that have a bearing on English literature of the Victorian period.

A somewhat one-sided account is *John Ruskin and Effie Gray: The Story of a Marriage* (Scribner) edited by Admiral Sir William James. The book is a selection of hitherto unpublished letters by which Sir William tries to paint Ruskin as an unnatural monster in his relations with the woman who succeeded in having her marriage to him annulled after six years. The most detailed life of Thackeray yet to appear is Lionel Stevenson's *The Showman of Vanity Fair* (Scribner). A chronological account, it is a bit short on criticism and contains no bibliography.

In great praise of Anthony Trollope is Chauncey Brewster Tinker's "Trollope" (*YR*), an essay evaluating the novelist, concerning whom the conclusion is drawn, "Of all the great Victorian novelists, he is the most engaging because of his very simplicity." A good introduction to the writer is *The Trollope Reader* (Oxford) edited by Esther Cloudman Dunn and Marion E. Dodd with an inclusive preface.

"Character-types of Scott, Balzac, Dickens, Zola" (*PMLA*) by Jared Wenger is an analysis of the character creations of the four novelists according to a theatrical "type-casting" system, and "Sherlock Holmes Borrows A Plot" (*MLQ*), by John Robert Moore, reveals Conan Doyle's dependence on Thackeray's *Miss Shum's Husband* for his story *The Man with the Twisted Lip.*

In *A History of the Late Nineteenth Century Drama, 1850-1900,* (2 vols.) (Macmillan), Prof. Allardyce Nicoll completed his task of writing a history of the English drama from the reopening of the theatres in 1660 to the close of the nineteenth century. An excellent, scholarly book, it includes a fine study of Shaw and good analyses of Wilde, Jones, and Pinero.

NINETEENTH CENTURY POETRY

"Tennyson's Merlin" (*SP*) by Gordon S. Haight suggested that Scott was the "Wizard of the North" who might have first inspired Tennyson to follow the "Gleam," or "the higher poetic imagination." Herbert E. Greene in "Browning's Knowledge of Music" (*PMLA*) printed an unpublished letter from Browning to the Rev. Henry G. Spaulding of Boston attesting to the poet's training in and knowledge of music proper. Alfred M. Terhune published *The Life of Edward Fitzgerald* (Yale), a witty, scholarly, and complete biography, the most comprehensive work yet done on the translator of old Omar.

"The Poetic Theory of Gerard Manley Hopkins" (*PQ*) was examined in two articles of that title, by Selma Jeanne Cohen and John K. Mathison.

TWENTIETH CENTURY

A challenging and vividly written book is William York Tindall's *Forces in Modern British Literature, 1885-1946* (Knopf). Shaw, Wells, Kipling, Hardy, Conrad, Yeats, Lawrence, Synge, Eliot, Housman, and others are treated in this history of British writing of the past 60 years. In *The Poetry of Thomas Hardy* (Columbia), James Granville Southworth provides an analysis of Hardy's poetic artistry. His thesis is that Hardy can not be ranked with the great poets because "his lark never lost itself in the light." *The Portable Conrad* (Viking), edited by Morton D. Zabel, has a good if not brilliant introduction, and *Frank Harris* (Odyssey), by E. Merrill Root, is a highly sympathetic biography in which Harris is pictured as a great writer and a great man. Hugh Kenner in *Paradox in Chesterton* (Sheed and Ward) sees G.K.C. as an original and profound thinker.

Letters of James M. Barrie (Scribner), edited by Viola Meynell, is a collection commencing in the early 90's and ending with a deathbed note to the author's valet in 1937. The letters reflect the almost morbid shyness of the Scottish dramatist and disclose little of his inner self. A more interesting book is *Lady Gregory's Journals, 1916-1930* (Macmillan), edited by Lennox Robinson, in which we are taken behind the scenes at the Abbey Theatre, through the Irish Civil War, and into the company of Shaw, Yeats, and others.

Two Synge items were published by David H. Greene—"The Shadow of the Glen and the Widow of Ephesus" (*PMLA*)—presenting clear evidence that Synge modeled his play on an authentic Irish folk tale still current in the west of Ireland, and *"The Tinker's Wedding,* A Revaluation" (*PMLA*) holding that, though an artistic failure, the play has real value as an important connecting link between the one-act plays of Synge's apprenticeship and the three-act plays of his maturity. William Irvine wrote two articles on Shaw. In "Shaw, the Fabians, and the Utilitarians" (*JHI*) he says: "His Life Force theory erects anarchy into an ethics and a philosophy." And in *"Man and Superman,* A Step in Shavian Disillusionment" (*HLQ*) he calls the play "fundamentally . . . a pronouncement, full of desperate pessimism and even more desperate optimism, on the progress of social reform."

An excellent addition to critical writing on Joyce is Richard M. Kain's *Fabulous Voyager: James Joyce's "Ulysses"* (Chicago), which serves as a guide to the various themes that run through the Joyce masterpiece. As for *The Portable James Joyce* (Viking), edited by Harry Levin, it includes an enlightening introduction and a splendid selection except that there are only 41 pages from *Ulysses*. *The Portable D. H. Lawrence* (Viking) also contains a good selection and a quite able introduction by the editor, Diana Trilling.

Charles R. Sanders provided "A Chronological Check List of Lytton Strachey's Writings" (*MP*), and Glenway Wescott in an article in *Harper's Magazine* entitled "Somerset Maugham and Posterity" expressed the belief that Maugham's "best books, perhaps eight or ten volumes, are better than almost anyone's today, and will endure for posterity." Charles J. Rolo, writing in *The Atlantic Monthly* on "Aldous Huxley," concluded: "The tale his books tell is a twentieth-century Pilgrim's Progress. . . . He echoes our frustrations, articulates our dilemmas, chronicles our struggle with the Janus-headed monster that has Time on one face and Ego on the other. He has come close to writing a biography of the ideas of modern man." "The Pieties of Evelyn Waugh" (*KR*), by Donat O'Donnell, was an analysis of Waugh's religion, in which the main emotional constituent was found to be a deep English romanticism. Says the author: "In Mr. Waugh's theology, the love of money is not only not the root of all evil, it is a preliminary form of the love of God."

AMERICAN LITERATURE

Alfred Owen Aldridge in "Jonathan Edwards and William Godwin on Virtue" (*AL*) demonstrated the influence of the Puritan divine's theories of virtue and of will on the British economist, while Philip Marsh in "Jefferson and Freneau" (*ASch*) told the story of Freneau's editorship of the *National Gazette,* founded with Jefferson's backing as the voice of Jeffersonian Republicanism, and of the relationship between the poet and the future president. Writing on "Cooper's *The Crater*" (*AL*), Harold H. Scudder concluded that there now seems to be evidence that Cooper's plot was in part factual and that Cooper was also making a defense of the newly announced economic views of his former publisher, Henry C. Carey. The same author contributed "Cooper and the Barbary Coast" (*PMLA*), pointing out that the novelist made use in *Homeward Bound* of Captain Judah Paddock's narrative of adventure which he had found already in print.

Arlin Turner suggested four "Sources of Poe's *A Descent into the Maelstrom*" (*JEGP*): the *Encyclopaedia Britannica* article on the Maelstrom; the narrative of an American sea captain in *The Mariner's Chronicle;* "Le Maelstrom" an anonymous story in *Le Magasin Universel* for April 1836; and the *Britannica* article on "Whirlpool." "Poe and Mesmerism" (*PMLA*) by Sidney E. Lind advanced the belief that Poe intended *Mesmeric Revelation* and *The Facts in the Case of M. Valdemar* as serious fiction, but that when they were greeted with enthusiasm by mesmerists and spiritualists and with incredulity by skeptics, he declared them to be hoaxes in order to capitalize upon the attendant publicity.

VAN WYCK BROOKS

The Times of Melville and Whitman (Dutton) by Van Wyck Brooks is the fourth volume of his series on American literary history and presents the era from 1840 to 1890. Done in Brooks' familiar style, there are chapters on Irving's New York, on Philadelphia, the South, the Middle West and the Far West, three chapters on Whitman, two on Melville, two on Mark Twain, and one on Bret Harte. Other writers given marked attention are Constance Fenimore Woolson, Sidney Lanier, Joel Chandler Harris, Miss Murfree, and George W. Cable. Despite Brooks' vivid account, one could wish for more specific documentation of his materials. Charles Olson's *Call Me Ishmael* (Reynal and Hitchcock) presents the largely intuitive thesis that Melville had the primal experience of space (the immense Pacific) and this is what he gained from his whaling voyage. *Moby Dick* is the magnification of Bigness at the cost of humanity. Willie T. Weathers' "Whitman's Poetic Translations of His 1855 Preface" (*AL*) reveals the manner in which Whitman extracted from his statement of poetic theory phrases and lines which he scattered through *Leaves of Grass* in subsequent editions.

THOREAU, HOLMES, LOWELL

Painting Thoreau as at heart an adventurer who became an economist in order that he might adventure further, James McBride Dabbs in "Thoreau: The Adventurer As Economist" (*YR*) says: "Thoreau kept his eye on the end. He knew what he wanted—life the adventure—and he studied how best to get it." A biography of Dr. Oliver Wendell Holmes done with objectivity and treating both the literary and scientific sides of his career most adequately is Eleanor M. Tilton's *Amiable Autocrat* (Henry Schuman). Kathryn Anderson McEuen examines "Lowell's Puns" (*AS*), which comprised a large part of his wit and humor. Correspondence of the Southern poet Paul Hamilton Hayne is the subject of "Whittier and Hayne: A Record of Friendship" (*AL*) by Max L. Griffin and of "Paul Hamilton Hayne to Dr. Francis Peyre Porcher" (*SP*) by Richard Beale Davis. The first article discusses the bond between the two poets as revealed in an exchange of letters, and the second puts into print seven letters from Hayne to Dr. Porcher between 1864 and 1873 which tell of his poetic labors, his religious doubts, his critical opinions, and his publishing difficulties.

MARK TWAIN

The year saw continued interest in America's most famous humorist. *Mark Twain in Nevada* (Scribner), by Effie Mona Mack, treats the three years following Clemens' arrival in Nevada in 1861 as secretary to his brother Orion, the Secretary of the new Territory. "The Love Letters of Mark Twain," edited by Dixon Wecter, the recently appointed Literary Executor of the Mark Twain Estate, appeared in *The Atlantic Monthly*. The first batch of the hitherto unpublished correspondence of Sam Clemens, most of the letters are to his fiancée, Olivia Langdon, and reveal Sam as a tender if occasionally bantering lover. Leon T. Dickinson in "Mark Twain's Revisions in Writing *The Innocents Abroad*" (*AL*) showed how the book differs from the *Alta California* letters and what Clemens did to make it different, while Fred W. Lorch in "Mark Twain's Sandwich Islands Lecture at St. Louis" (*AL*) printed the lecture with an account of its reception and also Clemens' letter ballyhooing it to the editor of the *Sunday Republican*.

LEW WALLACE AND OTHER MIDWESTERNS

"Ben-Hur" Wallace (California) by Irving McKee is a lively account of Lew Wallace and his times, and *Edward Eggleston* (King's Crown) by William Peirce Randel is a competent biography of the author of *The Hoosier Schoolmaster*, revealing Eggleston as an honest man whose greatest fear was that of being overcome by illusion. Nathalia Wright examined "The East Tennessee Background of Sidney Lanier's *Tiger-Lilies*" (*AL*) and found it accurate, while George J. Becker in "Albion W. Tourgee: Pioneer in Social Criticism" (*AL*) evaluated the writings of Tourgee and stated that "his efforts as a pioneer novelist in the uncharted field of social criticism are worthy of continued attention" rather than of the neglect which has been their lot. Publication of *The Journals of Francis Parkman* (Harper) edited by Mason Wade was the result of Wade's discovery of the long-missing journals in Parkman's attic study, closed since the historian's death in 1893.

HENRY ADAMS

Harold Dean Cater edited *Henry Adams and His Friends* (Houghton Mifflin), a collection of unpublished letters with an informative introduction in which the reasons for and effects of Mrs. Adams' suicide are discussed in an open and salutary manner, and Richard F. Miller in "Henry Adams and the Influence of Woman" (*AL*) asserted that, more than any other man of his age, Adams sought to understand Woman.

HOWELLS AND JAMES

Scrutiny of *A Chance Acquaintance*, *A Foregone Conclusion*, and *Their Wedding Journey* led William M. Gibson to conclude in "Materials and Form in Howells's First Novels" (*AL*) that the novelist's formula was simply to incorporate ideas and incidents which he had worked out embryonically in his varied, numerous early writings. An event of first importance to modern literature was the publication of *The Notebooks of Henry James* (Oxford), edited by F. O. Matthiessen and Kenneth B. Murdock. All of his novels are mentioned, some in great detail, in these notebooks. In *The James Family* (Knopf), Professor Matthiessen selected from the writings of Henry James, Sr., William, Henry, and Alice, the passages that reveal most clearly the characters of the various members of the family.

EDITH WHARTON AND OTHERS

Portrait of Edith Wharton (D. Appleton-Century) by Percy Lubbock sketches Henry James' most gifted disciple through a series of brief impressions written by various friends of Mrs. Wharton and woven together by the author to form a unified whole. The seventh book in the Makers of Modern Literature series. *Edwin Arlington Robinson* (New Directions), by Yvor Winters, though systematically and intelligently done, suffers from the absence of sufficient quotation of the poetry. *George Ade* (Bobbs-Merrill), by Fred C. Kelly, was a pleasant eulogy of the humorist by a close friend but was lacking in analysis of Ade's work. Robert Penn Warren entered into a profound analysis of "Hemingway" (*KR*) in which he found a similarity between Wordsworth and Hemingway "on the grounds of a romantic anti-intellectualism." "Action As Passion: *Tristan* and *Murder in the Cathedral*" (*KR*), by Francis Fergusson, was a consideration of Wagner's and Eliot's dramas, both of which the author viewed as taking "Passion" as the clue to life and dramaturgy.

Books and articles of a more general nature dealing with American literature included *The Shapers of American Fiction, 1798-1947* (Dutton) by George Snell, who classifies our fiction writers into the dominant strains of Romantics, Apocalyptics, Temperamentists, and Realists. Frank Luther Mott in *Golden Multitudes* (Macmillan) did a pioneer study of America's best selling books from Michael Wigglesworth's *Day of Doom* to *Forever Amber* and *Brave Men,* analyzing what makes a best seller, and providing an excellent list of best and better sellers through the years. Maxwell Geismar in *The Last of the Provincials: The American Novel, 1915-1925* (Houghton Mifflin) discussed in lengthy essays H. L. Mencken, Sinclair Lewis, Willa Cather, Sherwood Anderson, and F. Scott Fitzgerald as presenting the main historical motif of the period: the final conquest of the American town. *A Southern Vanguard* (Prentice-Hall) edited by Allen Tate was the John Peale Bishop Memorial Volume, an anthology of young Southern writers with a preface by the editor. *"Not Men:* A Natural History of American Naturalism" (*KR*) by Malcolm Cowley advanced an interesting analysis of the movement spearheaded by Frank Norris and Theodore Dreiser and numbering such writers as Lewis, Farrell, Dos Passos, Sinclair, Wright, Steinbeck, and O'Neill. Almost all of them Cowley finds defective in style, but "for all their faults . . . embarked on a bolder venture than those other writers whose imaginations can absorb nothing but legends already treated in other books, prepared and predigested food."

MISCELLANEOUS

Books and articles which defy ready classification include *Wordsworthian and Other Studies* (Oxford) by Ernest De Selincourt, a volume of eight essays, two on Wordsworth. Perhaps best are "Landor's Prose," "Walt Whitman," and "The Art of Conversation." *Ladies of Literature* (Hastings House) by Laura L. Hinkley contained six biographical and critical studies—Charlotte and Emily Brontë, Fanny Burney, Jane Austen, Elizabeth Barrett Browning, and George Eliot. Ellery Sedgwick, former editor of *The Atlantic Monthly,* in *Atlantic Harvest* (Little, Brown) chose selections of 46 authors from the period of his editorship and more than 40 years before and prefaced the reprinting of their work with a pleasant introduction. The first attempt to outline on a broad basis the origin and development of modern drama came in *A History of Modern Drama* (D. Appleton-Century), edited by Barrett H. Clark and George Freedley. Among others, the drama of Britain and the United States in the past century is reviewed, and the reading lists are excellent. A provocative article was provided by Robert M. Coates, "The State of the Novel" (*YR*). The modern novel suffers, according to Coates, "because it has abandoned its true strength, which is poetry, and is being drawn into the anecdotal, which is its weakness." He places the blame largely on the fact that our novelists write with one eye on the movie possibilities of their work. A suggestion that poets who write in the Symbolist manner should provide notes to their poems so that they shall not run the risk of being grievously misunderstood was advanced by Richmond C. Beatty in "The Heritage of Symbolism in Modern Poetry" (*YR*).

GERMANIC LANGUAGES AND LITERATURES

By Richard Jente
Head, Department of Germanic Languages and Literatures,
University of North Carolina

BIBLIOGRAPHY

The most complete and reliable current bibliography for the Germanic languages and literatures is that compiled annually by Henry W. Nordmeyer for the *PMLA** Supplement. While this includes only writings of Americans, that by J. G. Kunstmann "Recent Literature of the Renaissance: D. Germanic Languages," (*SP*, 44, 346-381), records the productions of foreign scholars as well. The *GR* and *MLN* list books received. The *AGR* contains interesting and illuminating information concerning early German settlers in America and also biographical accounts of Americans of German origin who have made noteworthy contributions to American civilization. It also brings in the April issue (pp. 36-39) a bibliography "Americana Germanica, 1946." The appended "Bibliography of German Printings in the United States, 1946" lists 25 titles. L. M. Price lists "Anglo-German Literary Bibliography for 1946" (*JEGP*, 46, 295-296). The *ASR* represents the interests of Americans of Scandinavian origin in noting the achievements of Scandinavians in the United States and in cultivating literary and scholarly connections with the mother country. It also emphasizes current bibliography of Scandinavian Americana.

LITERARY CRITICISM

Significant among the articles noted in this category are the following: Ernst A. Philippson, "Ueber das Verhältnis von Sage und Literatur, mit deutschen Beispielen, besonders aus der Rheinromantik" (*PMLA*, 62, 239-261); Ignace Feuerlicht, "Vom Wesen der deutschen Idylle" (*GR*, 22, 202-217); Wolfgang Weilgart, "Creative Tensions, a Tentative Typology of the Creative Mind" (*MfdU*, 39, 178-183); John R. Frey, "Deutsche Epiker der Gegenwart über die Kunst der Erzählung" (*MfdU*, 39, 373-388); F. K. Richter, "Deutsches Schrifttum seit dem Kriegsende" (*MfdU*, 39, 255-259); W. P. Friederich, "Late Renaissance, Baroque, or Counter Reformation?" (*JEGP*, 46, 132-143) proposes the last title as the most appropriate designation for this literary period, at least for Germany.

Two larger works deserve special mention: Paul Reiff, *Die Aesthetik der deutschen Frühromantik*, ed. by Theodor Geissendoerfer (Univ. of Ill. Press, Urbana, 1946, 305 pp.), and Helen Meredith Mustard, *The Lyric Cycle in German Literature* (King's Crown Press 1946, 276 pp.). The former, a posthumous work, whose Swiss-German author had taught at several American universities before his death in 1924, attempts to understand the nature of early German Romanticism, especially through aesthetics. The thorough survey by Miss Mustard makes it strikingly clear that an acquaintance with a whole cycle is necessary for the interpretation of the individual poem. Dr. Samuel Singer, of the University of Bern, treats the problem: "Dogma und Dichtung des Mittelalters" (*PMLA,* 62, 861-872).

---

* Abbreviations: *AGR—American-German Review, ASR—American Scandinavian Review, GQ—German Quarterly, GR—Germanic Review, JEGP—Journal of English and Germanic Philology, MfdU—Monatshefte fur deutschen Unterricht, MLN—Modern Language Notes, MLQ—Modern Language Quarterly, PMLA—Publications of the Modern Language Association, SP—Studies in Philology, SS—Scandinavian Studies.*

Here we can perhaps appropriately mention a collective publication which deserves the attention of all scholars and teachers of German: *Deutsche Beiträge zur geistigen Ueberlieferung,* issued by the Department of Germanic Languages and Literatures at the University of Chicago and edited by Arnold Bergstraesser (U. of Chicago Press, 1947, pp. IX, 252). Among the articles we note especially the following: Wilhelm Pauck, "Martin Luthers Glaube"; Matthijs Jolles, "Das religiöse Jugendbekenntnis Lessings"; Arnold Bergstraesser, "Der Friede in Goethes Dichtung"; Werner Richter, "Schiller und die Nachwelt"; Herbert Steiner, "Erinnerung an Hofmannsthal"; Fritz K. Richter, "Ernst Wiecherts Hirtennovelle."

EARLY LITERATURE AND LANGUAGE

For books and articles which treat distinctly linguistic aspects of the Germanic languages, especially of the early periods, the reader is referred to the article in this volume by my colleague, George S. Lane, "Indo-European Linguistics." A stimulating reexamination of the linguistic field of Germanics is presented by Arno Schirokauer, "Neue Probleme der deutschen Philologie" (*JEGP,* 46, 117-131). W. P. Lehmann, "Notes on the 'Hilderbrandslied' " (*MLN,* 62, 530-539) presents plausible emendations. R-M. S. Heffner, "The Third Basel Recipe, Ba III" (*JEGP,* 46, 248-253) offers additional interpretations. With increased interest in the question of authenticity, we welcome, as a basis for future study, Edwin H. Zeydel's, "A Chronological · Hrotsvitha Bibliography through 1700 with Annotations" (*JEGP,* 46, 290-294). We have seen only the few following articles on the Middle High German period: Ernst Rose, "Problems of Medieval Psychology as Presented in the *klein gemahel* of Heinrich the Unfortunate" (*GR,* 22, 182-187); George Nordmeyer, "Helmbrecht's Souveniers" (*MLQ,* 8, 211-216); Carl Selmer, "The Anonymous Late-MHG Poem *ain gemaine lere* and the Benedictine Rule" (*JEGP,* 46, 28-37).

A basic work on the medieval proverb is that by the editor of this survey, Richard Jente, *Proverbia Communia, a Fifteenth Century Collection of Dutch Proverbs, together with the Low German Version, Edited with Commentary* (Indiana University Publications, Folklore Series, no. 4, Bloomington, 1947, pp. 334).

Arno Schirokauer, "Luthers Arbeit am Aesop" (*MLN,* 62, 73-84) emphasizes the high literary quality of the German translation which unfortunately remained but a fragment. W. Kurrelmeyer has continued his contributions to "Early Sixteenth Century Lexicography" (*MLN,* 62, 289-299).

Clair Hayden Bell has produced an extensive monograph *Georg Hager, a Meistersinger of Nurnberg, 1552-1634* (Univ. of Cal. Publications in Modern Philology, vol. 39, Berkeley and Los Angeles, Univ. of Cal. Press, 1947, pp. XIX, 431). Curt von Faber du Faur has brought to light interesting information on the chief work of the eccentric Quirin Kuhlmann (1651-1689), who suffered such a cruel fate because of his religious zeal: "Die Keimzelle des Kühlpsalters" (*JEGP,* 46, 150-163). Georg K. Anderson has reprinted a unique German broadside version of the Wandering Jew theme, ca. 1694: "Joseph Krantz, Twin of Ahasverus" (*GR,* 22, 188-201).

EIGHTEENTH CENTURY

An extensive treatment of freemasonry in Germany during this period, when many distinguished literary leaders were its followers, has been presented by Heinrich Schneider, *Quest for Mysteries, the Masonic Background for Literature in Eighteenth Century Germany* (Cornell U. Press, 1947, pp. 189). Hans M. Wolff presents an analysis of "Brockes Religion" (*PMLA,* 62, 1124-1152). English-German literary relations are touched upon by Daniel V. B. Hegeman, "Boswell's Interviews with Gottsched and Gellert" (*JEGP,* 46, 260-263). An illuminating article is that by Robert T. Clark, Jr., "Herder, Cesarotti and Vico" (*SP,* 44, 645-671). Here we see how some of Herder's unique ideas were inspired: Cesarotti's translation of Ossian and his notes were used by Denis in his German translation. These acquainted Herder with Vico's fundamental ideas which Herder then expanded. The following is a reprint of a once popular book: *Thoughts on Jesting, Translated in the year 1764 from the Second German Edition of a Work by Georg Friederich Meier of the University of Halle.* Edited with Introd. and Notes by Joseph Jones (U. of Texas Press, 1947, pp. XII, 137). We have also noted the following articles: J. D. Workman, "Lichtenberg's Irrationalism" (*MfdU,* 39, 335-350); R. O. Röseler, "Kant's Theory of Freedom as an Ethical Postulate" (*MfdU,* 39, 322-334); Bernhard Ulmer, "The Leitmotiv and Musical Structure in Lessing's Dramas" (*GR,* 22, 13-31).

GOETHE AND SCHILLER

A group of American scholars has undertaken, under the editorship of Erich A. Allbrecht, Newcomb College, New Orleans, La., a comprehensive bibliography of Goethe research by American scholars since 1914, as a supplement to the well-known Goedeke volume, to be issued as a bicentennial publication in 1949. An appeal has been sent out for cooperation and items should be sent to the editor. Heinz Bluhm has compiled a "Goethe Bibliography for 1942 to 1944, German Non-periodical Publications" (*MfdU,* 39, 126-133). John Hennig has written two articles: "John Stewart Blackie's Translation of Goethe's *Jahrmarktsfest zu Plundersweilern* (*MLQ,* 8, 91-100), and "Goethe and an English Critic of Manzoni" (*MfdU,* 39, 9-16). Werner Vordtriede, in "The Trial of the Books, in Goethe and Cervantes" (*MLN,* 62, 339-340), compares a possible source for an incident in *Der Triumph der Empfindsamkeit.* Robert T. Clark, Jr. has treated "The Psychological Framework of Goethe's Werther" (*JEGP,* 46, 273-278). We note the following shorter articles: John N. Hritzu, "Reflections on Stage Direction and Stage Scenery in Goethe's *Iphigenie auf Tauris*" (*MfdU,* 39, 12-23); Ludwig W. Kahn, "Goethe's *Iphigenie,* Kleist's *Amphitrion* and Kierkegaard" (*MfdU,* 39, 234-236; Heinrich Meyer, "A Rediscovered Goethe Letter" (*MfdU,* 39, 188-189); Franzi Ascher, "Von Goethe und Rilke" (*GA,* 20, 227-230).

Martin Joos, "Just how Dusty was the Urfaust?" (*MfdU,* 39, 277-284), hints that Goethe, contrary to accepted statements, did work at the manuscript during the early years at Weimar. Two long and stimulating articles which attempt to open up new vistas and interpretations are: Ernst Jockers, "Faust und die Natur" (*PMLA,* 62, 436-471; 707-734) and Oskar Seidlin, "Helena: vom Mythos zur Person" (*PMLA,* 62, 183-212). Clarence Boersma, "On the Dating of the *Faust* Prologue" (*MLN,* 62, 539-544), would move it nearer to 1797. A study by Norbert Fuerst, "Zur Gestaltenfülle des *Faust*" (*MfdU,* 39, 297-303), gives observations based on his occupation with *Faust* dictionary. We note a sympathetic study: F. C. Neumann, "Gefühl ist alles, eine Goethe-Studie" (*MfdU,* 39, 220-233). To those interested in Goethe, the scientist, we refer to a new translation: Goethe's Botany: *The Metamorphosis of Plants* (1790) and Tobler's *Ode to Nature* (1782), with an introduction and translation by Agnes Arber. (Waltham, Mass., Chronica Botanica, vol. 10, no. 2, pp. 67-124, 1946). New facts on Goethe's marital status are presented by Joseph A. von Bradish, "Goethe und Christiane. Mit Hinzuziehung von sechs unveröffentlichten Urkunden zu Goethes Ehe" (*GQ,* 20, 109-121). The only Schiller items we have seen are: Max Lederer, "Noch einmal Schillers Reliquien" (*MLN,* 62, 7-12), and that of Werner Richter noted above.

NINETEENTH CENTURY

New York University has published a 20-page abridgement of a dissertation by Hedwig Wahl Reinhardt, *Johann Friedrich Reichardt, 1752-1814. His Importance to the Romantic Movement in German Literature.* H. W. Nordmeyer, "Kleists *Amphitryon,* zur Deutung der Komödie" (*MfdU,* 39, 89-125), is the fifth and last article of a new interpretation, which, for the reader's sake, we regret did not appear in monograph form. Longfellow's occupation with Novalis is recorded by Percy Matenko, "Fragments from Longfellow's Workship: Novalis" (*GR,* 22, 32-41). We recommend the little book by Powell Spring, *Novalis, Pioneer of the Spirit* (Winter Park, Fla., The Orange Press, 1947, pp. 174). Daniel F. Coogan, Jr. has published a hitherto unknown "Heinrich Heine Letter" (*MfdU,* 39, 403-404). Rudolf Kayser, "Georg Herweghs Shakespeareauffassung" (*GQ,* 20, 231-238) treats a less known aspect of his activity. Jack M. Stein has treated "The Influence of Schopenhauer on Wagner's Concept of the 'Gesamtkunstwerk'" (*GR,* 22, 92-105). We have noted two treatments of Gottfried Keller: Herbert A. F. Rodeck, *Das Adjektiv in den gesammelten Gedichten Gottfried Kellers* (Johns Hopkins U. Diss., Ann Arbor, 1946, pp. 112); Herbert W. Reichert, "A Comparison of the Philosophies of Schiller and Keller" (*MfdU,* 39, 170-177). Two studies of poetry are: Heinrich Henel, "Conrad Ferdinand Meyer's Poetry" (*MfdU,* 39, 81-88); Ernst Rose, "The Poetry of Theodor Fontane" (*GQ,* 20, 42-45).

TWENTIETH CENTURY

The modern writers of the past generation as well as those still active have attracted a large number of investigators and commentators. Of the former group may be mentioned: Frederick Lehner, "Hermann Bahr" (*MfdU,* 39, 54-62); Frederick Hiebel, "Die Demut in der Dichtung Christian Morgensterns" (*GR,* 22, 55-71); Wolfgang Paulsen, "Carl Sternheim: A Bibliography" (*PQ,* 26, 45-61); Walter Naumann, "Hofmannsthals Auffassung von seiner Sendung als Dichter" (*MfdU,* 39, 184-187); Norbert Fuerst, "Three German Novels of Education. III. R. M. Rilke's *Malte* Laurids *Brigge*" (*MfdU,* 38, 463-478); F. B. Wahr, "*Der Magier* as an Interpretation of Rilke's Later Thought" (*JEGP,* 46, 188-198); S. Soloveitchik and E. B. Gladding, "Rilke's Original Russian Poems" (*MLN,* 62, 514-522); H. J. Meesen, "Stefan Georges '*Algabal* und die französische Decadence'" (*MfdU,* 39, 304-321); Thomas A. Riley, "Anti-Statism in German Literature as Exemplified in the Work of John Henry Mackay" (*PMLA,* 62, 828-843).

Articles and books on modern authors who have recently died are represented by the following: Karl Wolfskehl, *1933: A Poem Sequence,* in English and German, English translation by Carol North Valhope and Ernst Morwitz (New York, Schocken, 1947); W. A. Willibrand, "The Timely Dramas of Ernst Toller" (*MfdU,* 39, 157-169); Hugh W. Puckett, "Franz Werfel's Mission" (*GR,* 22, 117-125); Karl S. Weimar, "*Damian,* Posthumous Novel of Hermann Stehr" (*MfdU,* 38, 479-491); Ernst L. Loewenberg, "Gustav Frenssen, 1863-1946" (*MfdU,* 39, 248-254); F. K. Richter, "Ernst Hardt, 1876-1947, ein, Beitrag zur deutschen Neuromantik" (*MfdU,* 39, 190-194); Frederick W. J. Heuser, "Biographic and Autobiographic Elements in Gerhart Hauptmann's *Einsame Menschen*" (*GR,* 22, 218-225); Frank X. Braun, "Hauptmann's *Festspiel* and Frenssen's *Bismarck,* A Study in Political Contrasts" (*GR,* 22, 106-116); Albert Scholz, "Gerhart Hauptmanns Florian Geyer in der Literaturgeschichte" (*GQ,* 20, 49-56); F. B. Wahr, "Gerhart Hauptmann's 'Mary' Poems" (*MfdU,* 39, 145-156); Max Lederer, "Gerhart Hauptmann, November 15, 1862-June 8, 1946" (*GQ,* 20, 46-48). John C. Blankenagel has edited "Albrecht Haushofer's *Moabiter Sonnette*" (*GQ,* 20, 189-194) which were written in prison and through a fortunate chance were smuggled out just before the execution of this high-minded patriot.

Alcuin A. Hemmen has written a dissertation on *The Concept of Religious Tolerance in the Novels of Enrica von Handel-Mazzetti* (Ann Arbor, 1947, pp. 134) which he has followed up with an article: "Enrica von Handel-Mazzetti, ad multos annos" (*MfdU*, 38, 449-462).

We record the following writings on contemporary writers: Fred Genschmer, "Oskar Maria Graf: Since World War I" (*GQ*, 20, 57-61); Werner Striedieck, "Wolfgang Kirchbach and the Jüngstdeutschen" (*GR*, 22, 42-54); Harold von Hofe, "German Literature in Exile—Leonhard Frank" (*GQ*, 20, 122-128); Henry N. Carlebach, "'Thamar' bei Thomas Mann und im jüdischen Schrifttum" (*MfdU*, 39, 237-247); Peter Heller, "Some Functions of the Leitmotiv in Thomas Mann's Joseph Tetrology" (*JR*, 22, 126-141); Oskar Seidlin, "Laurence Sterne's *Tristram Shandy* and Thomas Mann's *Joseph the Provider*" (*MLQ*, 8, 101-118); Alvin Kronacher, *Fritz von Unruh, a Monograph,* Introduction by Albert Einstein, Translated by Julia R. Stiller (New York, Rudolf Schick Publ. Co., 1946, pp. 64); John G. Frank, "Hans Carossas Träume und die Romantik" (*MfdU*, 39, 209-219); Fred Genschmer, "The Ordeal of Erich Kästner" (*MfdU*, 39, 389-402); Friedrich Bruns, "Ernst Wiechert" (*MfdU*, 39, 355-372); Pauline Steiner and Horst Frenz, "Anderson and Stalling's *What Price Glory?* and Carl Zuckmayer's *Rivalen*" (*GQ*, 20, 239-251).

On Hermann Hesse, the recent Nobel prize-winner, we have seen only one article: Anna Jacobson, "Hermann Hesse, Gedanken anlässlich der Auszeichnung durch den Nobelpreis" (*MfdU*, 39, 1-8).

GERMANS IN AMERICA

Since the *American German Review* covers this field in particular, not only for literary articles but also for American-German art, music, history, science and industry, Americans of German origin will find much of interest to them, as for example the following articles dealing with literature: Heinrich Herbatschek, "Die Anfänge des deutschen Theaters in Milwaukee" (*AGR*, 13, no. 3, 17-18); E. Heyse Dummer, "Hermann Sudermann, a contributor to American Culture" (*AGR*, 13, no. 3, 26-29). The latter describes early performances of Sudermann's dramas in Chicago. Adolf E. Schroeder has turned up "New Sources of Charles Sealsfield" (*JEGP*, 46, 70-74). Carroll E. Reed has contributed two linguistic investigations: "A Survey of Pennsylvania German Phonology" (*MLQ*, 8, 267-289) and "The Question of Aspect in Pennsylvania German" (*GR*, 22, 5-12).

SCANDINAVIAN LANGUAGES AND LITERATURES

The American-Scandinavian Foundation has sponsored the publication of *A Second Book of Danish Verse*, translated by Charles Wharton Stork (Princeton U. Press, 1947, pp. XVIII, 155). The Cornell University Press has announced as in preparation a *History of Icelandic Prose Writers: 1800-1940* by Stefan Einarsson, to be printed as volumes 32 and 33 of *Islandica*.

The *American Scandinavian Review* brings numerous articles on various subjects, including literature, which are of interest particularly to Americans of Scandinavian origin. *Scandinavian Studies and Notes* contains only matter on the Scandinavian languages and literature. We note a few articles of general interest: Carl E. W. L. Dahlström, "The Parisian Reception of Strindberg's Plays" (*SS*, 19, 195-207); Albert M. Sturtevant, "An Analysis of Certain Metaphors in Tegnérs Poetry" (*SS*, 19, 270-277); Hedin Bronner, "A Comment on the Wartime Function of Norwegian Poetry" (*SS*, 19, 123-135).

TEACHING OF GERMAN AND THE SCANDINAVIAN LANGUAGES IN AMERICA

For several years, F. S. Crofts & Co. has issued a compilation of the modern language enrollment in the colleges and universities of the United States. In the 816 institutions covered in the fall of 1946, the enrollment in German with 105,778 students represented 26.7 per cent of the total, compared with French 30.6 per cent, and Spanish 42.7 per cent. The increase in German was 108 per cent higher than the year before, owing largely to the general increase in enrollment. The Croft report for the fall of 1947 shows some striking contrasts. In the 960 institutions covered, the general enrollment rose 12.5 per cent, while that in French, German, and Spanish was only 6.5 per cent higher. The increase in German over 1946 is 11.26 per cent with a total of 127,111. The French enrollment is 6.85 per cent higher than 1946, the Spanish only 3.21 per cent.

Gösta Franzen and Hedin Bronner have made a detailed survey of "Scandinavian Courses Offered in Institutions of Learning in the United States" (*SS*, 19, 239-260). Instruction was found to be concentrated largely in a few north central states.

ROMANCE LANGUAGES AND LITERATURES

By Ernest Richard Moore
Professor, Syracuse University

GENERAL

Two special issues of Romance language journals honored the memory of Cervantes on the quadricentennial of his birth (*Hisp**) and the memory of a celebrated Spanish scholar, Rudolph Schevill (*HR*), recently deceased.

The year's principal achievement of American scholars was an encyclopedia of critical opinion on 1,167 topics, contributed by 239 scholars and edited by the late Horatio Smith—*The Columbia Dictionary of Modern European Literature*. There is little doubt that this compilation will become a standard reference work in most American libraries and studies.

A new journal, *Symposium*, has appeared and offered its pages to scholars writing in or about the principal modern languages and literatures.

BIBLIOGRAPHY

General.—A general bibliography is published annually in the Supplement number of *PMLA*. A yearly survey, "Recent Literature of the Renaissance" (*SP* 265-432) has sections devoted to French, Spanish, and Italian literatures of that period.

Italian.—The "Bibliography of Italian Studies in America" (*Ital* 255 *et passim*), an annotated list, was continued by V. Luciani. O. Bontempo added "Italian Literature in 1946" (*MLJ* 283-288) to his survey of 1946. A short list of titles by K. Bottke indicated the extent to date of "The Study of Italian Phonetics in America" (*Ital* 251-252).

French.—Under the direction of David Cabeen a team of American scholars has collaborated in the first volume of a selective *Critical Bibliography of French Literature* (Syracuse) covering the period from the Middle Ages to 1945. Six additional volumes will be published. The tenth annual survey of "Anglo-French and Franco-American Studies" (*RR* 97-116) was compiled and annotated by D. Bond, J. Carrière, and E. Seeber.

---

* The following abbreviations are used in this section. Numbers refer to the pagination of the 1946 issues of the journal. *BA*, *Books Abroad; FR, French Review; HAHR, Hispanic American Historical Review; Hisp, Hispania; HR, Hispanic Review; Ital, Italica; L, Language; MLF, Modern Language Forum; MLJ, Modern Language Journal; MLN, Modern Language Notes; MLQ, Modern Language Quarterly; MP, Modern Philology; PMLA, Publications of the Modern Language Association; PQ, Philological Quarterly; RHM, Revista Hispánica Moderna; RI, Revista Iberoamericana; RR, Romanic Review; S, Speculum; SP, Studies in Philology; Sym, Symposium.* University presses are indicated by the name of the institution alone.

Henri Peyre wrote "Récents travaux sur la littérature française contemporaine" (*FR* 351-365), an excellent survey. "Une bibliographie supplémentaire des dictionnaires du français moderne" (*PLMA* 556-571), by R. Levy, listed 372 items of all classes of dictionaries with a useful subject index. As addenda to a recent book, M. Storer added two important "Bibliographical notes on Mme de Villedieu" (*MLN* 413-420).

Spanish.—O. Green gave a masterly summary of information and of trends in critical ideas for the period 1473-1600 in "A Critical Survey of Scholarship in the Field of Spanish Renaissance Literature 1914-1944" (*SP* 228-264), with fulsome bibliographical footnotes. J. Fucilla carried the previous study up to date in a limited field with his authoritative "The Present Status of Renaissance and *Siglo de Oro* Poetry" (*Hisp* 182-193). In homage of 30 years of teaching, former students published *Miguel Romera-Navarro: Bibliography of his Works* (Philadelphia).

Hispanic American.—The outstanding guide to literature in this field, the annual *Handbook of Latin American Studies* (*Harvard*), appeared in a volume that covered the year 1945. L. Barrett continued his "Theses Dealing with Hispano-American Language and Literature—1946" (*Hisp* 200-202). Two brief surveys were "Spanish American Books in 1946" (*MLJ* 289-293), to be contributed each year by J. Reid, and "Spanish American Literature in 1946" (*Hisp* 20-26) by D. Walsh. One hundred Brazilian authors and their major works were selected by M. Cilley in "Brazilian Literature" (*Hisp* 107-113). A brief appraisal of "A literatura Argentina no Brasil" (*RI* 135-141) was made by D. Wogan.

LINGUISTICS

General.—The duel between neogrammarians and eclectics was continued and summarized in R. Hall's "Science Comes to Languages" (*Sym* 1: 40-49) and M. Pei's ". . . Or Does It?" (*Sym* 1: 51-59), while E. Sturtevant presented the tenets of the new school in *An Introduction to Linguistic Science* (Yale). Examining the "Final *-s* in the Romania" (*RR* 159-166), R. Politzer concluded that "existing evidence excludes the Archaic loss of final *-s* as a satisfactory basis for the Romance distribution, which can be best understood by a consideration of the cultural and social forces which led to the creation of the individual Romance tongues in the eighth century."

French.—The "Linguistic Value of Michel Edition of Joinville's *Histoire de Saint Louis*" (*RR* 193-202) is a unique and authentic synthesis of French during the first half of the fourteenth century. L. Spitzer studied the "Joinville etymologie (preu homepreudome)" (*MLN* 505-514); G. Adams, "The Development of Classical Latin Consonant Groups of Three in Old French" (*SP* 1-3); C. Livingston, "Provençal *bus* and O. F. *bus*" (*Word* 210-215); A. Hatcher, "Le type *timbre-poste*" (*Word* 216-218); R. Levy considered "L'origine du vieux français *gaigaie*" (*Sym* 1: 7-11), as onomatopoetic, and interpreted "The Term *language* in *Le pelerinage de Charlemagne*" (*MLN* 125-126). English-French language influences were disclosed in "Anglicisms in French" (*PMLA* 1153-1177), by S. de Ullmann; "English *searce, search* 'sieve,' 'strainer'" (*MLN* 550-554), by C. Livingston; "Ragamuffin, ragman, rigmarole, and rogue" (*MLN* 85-92). R. Levy's "The Background and Significance of Judeo-French" (*MP* 1-7) was an historical and linguistic analysis.

Spanish.—The long-awaited *Tentative Dictionary of Medieval Spanish* (Chapel Hill), compiled by R. S. Boggs *et al.*, was issued in two mimeographed volumes for correction by other scholars. M. Goldberg compiled an *English-Spanish Chemical and Medical Dictionary* (McGraw). A. Alonso replied to R. Predmore with a "Nota sobre una ley fonológica del español" (*HR* 306-307), and stated that "Árabe *st*> esp. *ç*. —esp. *st*> árabe *ch*" (*PMLA* 325-338). Y. Malkiel found a "Latin-Hebrew Blend" (*HR* 272-301) in Hispanic *desmazalado*. J. and H. Corominas traced "Spanish *santurrón*" (*MLN* 122-124) to Old French; C. Kany investigated "Some Aspects of Bolivian Popular Speech" (*HR* 193-205). No influence of Brazilian speech on that of the Azores was seen by F. Rogers in his study (*MLN* 361-369).

Italian.—A. Mezzacappa's "A casa le buone femmine" (*Ital* 248-250) suggested that such phrases develop syntactically from an absorbed preposition "a." M. Treves published some "Remarks on Italian Phonetics" (*Ital* 62-68), and L. Spitzer gave the etymologies of "sbaglio, abbaglio, (ab)bagliare, bagliore, barbaglio" (*Ital* 69-72).

FRENCH LITERATURE

General.—An amusing and original article was H. Grubb's "Nonsense in France and in French Literature" (*MLQ* 21-30), showing the independence and difference from English models of French nonsense literature.

Early.—E. Place suggested six new readings in "Problems in the Oxford *Roland*" (*PLMA* 873-886); and A. Schutz added an interpretation to "Roland v337" (*MLN* 456-461). J. Williams' "Godfrey of Rheims" (*S* 29-45) was a new study on the eleventh century humanist. "The Old French Verse Bible of Macé de la Charité" (*S* 226-239) is a translation of the *Aurora,* the medieval Latin verse Bible. U. Holmes supported the view that "The *Pelerinage de Charlemagne*" (*Sym* 1: 75-81) was not necessarily composed in the Paris area or inspired by the Lendit; G. Adler, studying the same poem, discussed treatment in it of contemporary events (*S* 550-561); A. Hatcher (*Sp* 4-25) suggested some emendations and new interpretations to the Leipzig 1923 text. In "A New Interpretation of Chrétien's *Conte du graal*" (*SP* 453-476), U. Holmes argued "that in the mind of Chrétien, and in that of Philippe d'Alsace, the Grail story was the conversion of Judaism to Christianity"; H. Adolf, referring to the same *conte* (*MLQ* 3-20), reconstructed the immediate sources of the poet, and in another article threw "New Light on Oriental Sources for Wolfram's *Parzival* and Other Grail Romances" (*PMLA* 303-326); A. Adler explored the concept of "Sovereignty in Chrétien's *Yvain*" (*PMLA* 281-305) and traced "The theme of 'the handsome coward' and of 'the handsome unknown' in Meraugis de Portlesguez" (*MP* 218-224). Of interest also are J. Andressohn's *The Ancestry and Life of Godfrey of Bouillon* (Indiana), R. Walpole's *Philip Mouskes and the Pseudo-Turpin Chronicle* (California), and H. Williams' *Floriant et Florete* (Michigan). L. Spitzer added a new reading of "Le vers 2 d'*Aucassin et Nicolette*" (*MP* 8-14). An excellent view of the "Present Status of Studies in Saints' Lives in Old French Verse" (*Sym* 2: 82-86) was presented by W. Bowen. Some Provençal studies: C. Bühler, "The Phillipps MS. of Provençal Poetry now MS. 819 of the Pierpont Morgan Library" (*S* 68-74), a new index to its 73 poets and 494 poems; A. Schutz, "Some Character Attributes in the Provençal *vidas* and *razos* (*Sym* 1: 119-139), a linguistic analysis of then current meanings of eight such words; F. Chambers, wrote "On the Attribution of a Provençal Poem" (*MLN* 320-321) to Gausbert de Poicibot.

Sixteenth Century.—M. Françon contributed a "Note on the Use of the Guidonian Nomenclature by Marchant and Rabelais" (*S* 249-250), and on Rabelais' *Pantagruel* and the Draught of "Eté 1532" (*MLN* 474-475). B. Weinberg saw in "The Sources of Grêvins Ideas on Comedy and Tragedy" (*MP* 46-53) "the merest beginnings of the classical theory" of drama. J. Lapp, writing on Ronsard's friend, "Pontus de Tyard and the Science of his Age" (*RR* 16-22), credited him with rejection of stifling authority, and also disclosed "The Identity of Pontus de Tyard's *curieux*" (*MLN* 468-471)—the poet, Guillaume des Autels.

Seventeenth Century.—G. Brée

believes that "Le thème de la violence" (*RR* 216-225) in Racine's tragedies arises from a conflict of power and will, leaving death or insanity as the only solutions; she also analyzed "the technique of Racine as exposed in prefaces to his plays (*S* 2: 99-105). "Molière's Debt to Montaigne" (*MLQ* 290-301) was, C. Wadsworth believes, fundamental, philosophic, and contributory to the lasting qualities of his greatest plays. P. A. Wadsworth showed the evolution of the final chapter of *Caractères* in "La Bruyère against the Libertine" (*RR* 226-233) and concluded that his was not a pious pose or dutiful gesture but an affirmation of faith. B. Morrissette explored *The Life and Works of Marie-Catherine Desjardins (Mme de Villedieu)* (Washington U.), practitioner of the historical novel.

Eighteenth Century.—C. Brenner discussed the *Dramatization of French Stories in the Eighteenth Century* (California). "Montesquieu's Historical Conception of the Fundamental Law" (*RR* 234-242) recrystallized two contrasting theories of monarchy in pre-revolutionary France, according to E. Pierce. A masterly series of *Studies on Voltaire with Some Unpublished Papers of Mme du Chatelet* (Princeton) was written by I. O. Wade. G. Havens made a minor correction to Voltaire's poem on the Lisbon disaster (*MLN* 465-468). M. Ellis, in "Jean-Jacques Rousseau, Biographical Problems" (*RR* 117-132), cast light on four episodes in his life; M. Françon discussed two additions by Rousseau to his *Discours* (*MLN* 342-343). D. Gordon and N. Torrey presented a lengthy study of *The Censoring of Diderot's 'Encyclopédie' and the Re-established Press* (Columbia). "Two Unpublished Satirical songs of Jacques Cazotte" (*MLN* 322-325) were put into print by E. Shaw. A Jacobin poet who lived in Virginia was "Quesnay de Beaurepaire" (*FR* 463-470), written by J. Roberts. Finally, L. Forky discussed *The Role of Money in French Comedy during the Reign of Louis XIV* (Johns Hopkins).

Nineteenth Century.—"Recent French Criticism on romanticism" (*Sym* 2: 43-53), J. Salvan discovered, encourages expansion on the social and not on the individual plane. M. Bishop proved that "Chateaubriand did not meet Washington" (*MLN* 412-413). C. Lynes showed that the same writer considered the "French Renaissance" (*PMLA* 422-435) barbarous and morally corrupt; and E. Malakis, that Renan borrowed from him "Le miracle juif" (*MLN* 475-477). Victor Hugo attracted analysts: W. Pondell, *Victor Hugo's Acted Dramas and the Contemporary Press* (Johns Hopkins); S. Braun, *The 'courtisane' in the French Theatre from Hugo to Becque (1831-1885)* (Johns Hopkins). C. Lynes wished to prove that *"Reappearing Characters in the 'Comédie humaine'"* (*RR* 329-335) is an esthetic device of negative value; R. Vigneron gave a scrupulous account of the first three editions, with textual emandations of the same series of novels (*MP* 165-188). B. Bart saw "The moral of Flaubert's *Saint Julien*" (*RR* 23-33) deriving from his doctrine of impassibility as a fusion of esthetics and morality; L. Miller gave evidence of the novelist's regard for Sainte-Beuve (*MLF* 45-59); and M. Bonwit examined "The Significance of the Dog in Flaubert's *Education sentimentale*" (*PMLA* 517-524). The naturalists: L. White, "Representative French criticism of *Les Rougon-Macquart,* 1873-95" (Illinois, thesis abstract); S. Braun, "Zola's Esthetic Approach and the Courtesan" (*MLN* 449-456), a chaste and moral motivation; D. Jones, "Gavarni and the Goncourts' *Henriette Marechal*" (*MLN* 405-409), the lithographer's influence.

L. Wylie published an interesting study of *Saint-Marc Girardin—bourgeois* (Syracuse) and disclosed that his lectures on "Poetry at the Sorbonne" (*Sym* 1: 112-118) were political and popular. A. Schaffer gathered principally biographical information "On Some Contributors to *Le Parnasse contemporain*" (*MLQ* 235-242), an anthology of new verse issued in

1866, 1869, and 1876 by Alphonse Lemerre.

Symbolist poets attracted several scholars: C. MacIntyre translated *One Hundred Poems from 'Les fleurs du mal'* (California); W. Fowlie attempted to assort and expand the meanings of "The theme of Night in Four Sonnets of Mallarmé" (*MP* 248-258); J. Bernstein studied *Baudelaire, Rimbaud Verlaine* (Citadel); A. Matthews produced a complete summary of the review, *La Wallonie, 1886-1892* (King's Crown), in which Belgian symbolists found an ally and voice.

Twentieth Century.—B. Weinberg on the basis of a purely structural analysis gave "An interpretation of Valéry's *Le cimetière marin*" (*RR* 113-158)—that the spectator must exploit life to its fullest to obtain now absent joys; K. Douglas studied "Paul Valéry's Abandonment and Return to Literature" (*FR* 203-209); L. Allen listed several possibilities in "The Literary Background of Claudel's 'Parabole d'animus et anima'" (*MLN* 316-319). R. Virtanen commented on "Barrés and Pascal" (*PMLA* 802-823), especially on the former's inadequate interpretations; André Bourgeois found "René Boyesve" (*FR* 372-387) a friend of spontaneous anarchism it results in eventual order. A. Balakian inquired into the *Literary Origins of Surrealism* (King's Crown); A. Gaudin analyzed the surrealist "Poésie de Jacques Prévert" (*FR* 383-392).

D. Saurat examined *Modern French Literature, 1870-1940* (Putnam). G. Brée gave a new insight into Proust's composing habits (*RR* 43-52). *The Journals of André Gide* (Knopf) were translated and annotated in a major piece of scholarship by J. O'Brien. "Maurice Bedel" (*FR* 366-371) was, in the view of L. Forkey, a prophet of the disaster to befall the Third Republic. E. Fay surveyed and summarized critics appraisals of "The Philosophy of Saint Exupéry" (*MLJ* 90-97). D. Alden presented an interesting view of "French Literature since the Liberation" (*FR* 267-275).

ITALIAN LITERATURE

Dante.—Scholarly investigation was limited almost entirely to the Dante-Petrarch age. Three studies looked into Dante's sources: "Further Gleanings from 'Dante's Latin Dictionary'" (*RR* 3-12) by H. Austin continued the 1946 article in *Italia;* "Notes on the Greek in 'Dante's Latin Dictionary'" (*SP* 477-482), also by Austin, showed that sources other than Uguiccione may have been used; "Did Dante Know Terrance?" (*Ital* 212-218) was answered affirmatively by J. Russo. Asking whether Dante's general progress in Hell was "Clockwise or counter-clockwise?" (*Ital* 201-205) H. Austin built up reasons for the former. Several textual clarifications appeared in *Italica* (14-19, 119-124), *PMLA* (555-556), and *RR* (13-15).

Petrarch.—E. Wilkins published two authoritative articles: full descriptions and clarifications of 28 "Manuscripts of the *Canzoniere* and the Triumphs of Petrarch in American libraries" (*MP* 23-35) and edited in part "A Morgan miscellany" (*Ital* 187-195), MS. 326. D. Phillips found a key to "Petrarch's Ethical Principles" (*Ital* 219-232) in his doctrine of self-knowledge.

Others.—V. Cioffari saw "The Functions of Fortune in Dante, Boccaccio, and Machiavelli" (*Ital* 1-13), principally in the latter, as "uncontrollable indeterminism." O. Evans exposed "Two Misrepresentations of Machiavelli's *Clizia*" (*PQ* 90-91) by nineteenth century critics. C. Gilbert offered addenda and cross-index to a previous inventory of "Michael Angelo's Poetry in English Verse" (*Ital* 46-53). M. De Fillipis commented on the favor 'Straparola's Riddles" (*Ital* 134-146) enjoyed among European writers. A search for "The Philosophy of Man in the Italian Renaissance" (*Ital* 93-112) was undertaken by P. Kristeller.

SPANISH LITERATURE

General.—The principal general study was D. Alonso's *Ensayos sobre poesía española* (Macmillan). An important continuing article "Indice de analogías entre la lírica española y la moderna" (*Sym* 1: 12-33, 2: 4-35), classifying these parallelisms by subject and verse form, was contributed by E. Torner. J. Gillet considered the historical origins and development of the frequent rhyme "Lucrecia-necia" (*HR* 120-136).

Early.—"The debt of the *Poema de Alfonso onceno* to the *Libro de Alexandre*" (*HR* 436-452) was considered as considerable and direct by G. Davis. E. Roditi published a full bibliographical description of the unique fifteenth century "Chicago Manuscript of the Castilian *Breviario de amor*" (*MP* 15-22), derived from the Provençal *Breviari d'amor* by Matfri Ermengaut. The chief interest of "The Second Eclogue of Garcilaso de La Vega" (*HR* 251-271) is in its psychological intensity if we agree with A. Lumsdem. F. Sánchez y Escribano examined "La colaboración en la *Philosofía vulgar* de Juan de Mal Lara" (*HR* 308-312) by "un amigo" (Cristobal de Tamariz?) and his own father. In "One Man's Library, Manila, 1583" (*HR* 84-100), I. Leonard annotated 55 titles as additional evidence of the diffusion of Spanish literary culture. O. Green classified some misconceptions about "The Celestina and the Inquisition" (*HR* 211-216) and also attempted to reconcile "Fernando de Rojas, *converso and hidalgo*" (*HR*). R. Frank explained "Four Paradoxes in *The Celestina*" characters by reference to the mores and literary traditions of Rojas' time (*RR* 53-68).

Golden Age.—In honor of Cervantes on the 400th anniversary of his death, A. Bell published an excellent critique, *Cervantes* (Oklahoma); H. Hatzfeld scanned "Thirty Years of Cervantes Criticism" (*Hisp* 321-328); and M. Singleton placed "The Date of *La española inglesa*" (*Hisp* 329-335), a *novela ejemplar,* in 1587. S. Nemtzow studied and classified "El estudiante en la comedia del Siglo de Oro" (*MLF* 60-81), a literary type. C. Bruerton placed "The Date of Schaeffer's *Tomo antiguo*" (*HR* 346-364) of plays as not before 1626. S. Morley and C. Bruerton issued important "Addenda to the Chronology of Lope de Vega's comedias" (*HR* 49-71) supplementing their book of 1940. Other Lope studies: J. Lincoln, *Saint Ursula, the Infanta Isabel, and Lope de Vega* (Michigan); C. Wagner, "The Date of *Peribañez*" (*HR* 72-83), 1604-1605. O. Green wrote a note on Count "Villamediana as 'Correo mayor' in the Kingdom of Naples" (*HR* 302-305). "Three notes on Alarcón's *Las paredes oyen*" (*HR* 378-383) by B. Ashcom gave as many new readings. "La antología de [José] Alfay y Baltasar Gracián" (*HR* 325-345) by M. Romera-Navarro refers to the authorship of *Poesías varias* (1654). Calderón had his admirers: E. Gates discussed the "Proverbs in the Plays of Calderón" (*RR* 203-215), where and how used; and F. Hayes wrote on "The Use of Proverbs as Titles and Motives" (*HR* 453-463) in 24 of his plays; E. Hesse offered proof that "Court References in Calderón's *zarzuelas*" (*HR* 365-377) occurred mainly in the *loas* and gave "verbal cameos" of court personages.

Later periods were interestingly explained by S. Gilman in "An Introduction to the Ideology of the Baroque in Spain" (*Sym* 1: 82-107) and F. Pierce in "The *canto épico* of the Seventeenth and Eighteenth Centuries" (*HR* 1-48), an "intrinsic part of the Renaissance literary epic."

Modern.—E. Templin in "Pío Baroja and science" (*HR* 165-192) disclosed Baroja's vast but dilettante knowledge of science. Joaquín Casalduero edited *Jorge Guillén: Cántico* (Macmillan).

HISPANIC AMERICAN LITERATURE

Colonial.—J. Spell, with his usual thoroughness, contributed new information from archival sources on "The Theatre in New Spain in the Early 18th Century" (*HR* 137-164) and on Eusebio Vela, a dramatist. A. Torres-Ríoseco's "Sor Juana Inés de la Cruz" (*RI* 13-38) was an analysis of her philosophy as seen in her poems.

Other.—On Argentina: D. Brown

interpreted "Some Significant Changes in the Second Edition [1942] of Manuel Gálvez' *Miércoles santo*" (*MLN* 471-473) as making it "at once more naturalistic and more christian"; M. Hole wrote about *Bartolomé Mitre: a poet in action* (Hispanic Institute). Columbia: A. Vargas Barón continued his "Vida y pensamiento de José Joaquín Vargas Valdés" (*RI* 93-123). Cuba: J. Leslie published a note on Julián de "Casal's Salomé" (*MLN* 402-404), a sonnet. Puerto Rico: D. Samuels' "El Crucero lírico de Providencia Riancho" (*RI* 125-130) reviewed a book published in 1939. Brazil: J. Lincoln's posthumously published *Charts of Brazilian Literature* (Edwards Bros) should be very helpful to scholars and teachers.

COMPARATIVE LITERATURE

General.—M. Sherwood investigated "Magic and Mechanics in Medieval Fiction" (*SP* 567-592), and B. Morgan offered some observations on "The Novelette as a Literary Form" (*Sym* 1: 34-39). The conflicting esthetic theories of 1800-1815, particularly in France, were inquired into by H. Garrett in "The Imitation of the Ideal" (*PMLA* 735-744). J. Wenger's "Character-types of Scott, Balzac, Dickens, Zola" (*PMLA* 213-232) demonstrates the creation by each novelist in his "average" novels of a personal mythology revolving about sex, youth, animals, and the devil. Parodies and translations of Hans Leip's lyrics "Lily Marlene" (*MLJ* 30-34) in Italian, French, English, and German, were published by J. Hieble.

Italian influences on English literature: R. Pratt made a thorough study of "Chaucer's Use of the *Teseida*" (*PMLA* 958-621), which was extensive; A. Gilbert showed that "The Italian names in [Jonson's] *Every Man Out of His Humour*" (*SP* 195-208) were used to individualize the characters; the same scholar in "Nevizanus, Ariosto, Florio, Harington, and Drummond" (*MLN* 129-130) traced the fate of an Italian epigram; V. Luciani's "Bacon and Machiavelli" (*Ital* 26-40) outlined the Englishman's impressive debt; R. Babcock unearthed the factual basis for "English Interest in Italy and Italian Romantic Criticism in the 18th Century" (*PQ* 152-158); A. Pace in "Franklin and Machiavelli" (*Sym* 2:36-42) concluded that the former writer had the latter's masterpiece in mind while writing his *Rules*. Other borrowings from the Italian: R. Hall suggested "A possible Italian model for Don Quijote" (*Ital* 233-234) in the personal misfortunes of Bernardo Tasso; R. Clark proved that Vico's ideas reached Herder through Cesarotti's Italian translation of Ossian (*SP* 645-671).

French influences on English literature: J. Schweitzer, "Another note on Dryden's use of Georges de Scudéry's *Almahide*" (*MLN* 262-263); F. Cordasco indicated Edouard Dujardin's formative influence on George Moore's biblical and religious novels (*MLN* 244-251); W. Vordtriede's "The Mirror as Symbol and Theme in the Works of Stephane Mallarmé and Stefan George" (*MLF* 13-24) showed the latter's debt to Mallarmé and French symbolism; A. Cooke undertook a study in parallelisms: "Henry Fielding and the Writers of Heroic Romance" (*PMLA* 984), particularly Mlle. de Scudéry; a contrasting treatment was offered in "George Moore and Paul Alexis" (*RR* 34-42) of the death of a Bohemian lady of Paris, as studied by R. Niess; H. Brady examined in detail *Chaucer and the French Poet Graunson* (Louisiana State). English-French influences: S. Atkins, "A Possible Dicken's Influence in Zola" (*MLQ* 302-308); H. Grubbs, "Mallarmé and Bryant" (*MLN* 410-412), a borrowed figure of speech; L. Douglas revealed that Pope did not intend "A severe animadversion on Bossu" (*PMLA* 690-706), the learned and popular French critic. French-Spanish relations: D. Brown, "Chateaubriand and the story of Feliciana in Jorge Isaacs' *María*" (*MLN* 326-329), this slave story being a brief version of *Atala;* N. Adams' "A note on Mme. Cottin and the Duke of Rivas" (*HR* 218-221) compared her *Mathilde* as versified in his *Malek-Adhel.* French-German relations: D. Van Abbé in "Some notes on cultural relations between France and Germany in the nineteenth century" (*MLQ* 217-227) saw little influence after Voltaire until the naturalists; W. Oechler used Stefan Zweig's letters to Julius Bab to mirror "The reception of Emile Verhaeren in Germany" (*MLN* 226-233); S. Ezban reviewed the influence of Goethe and Nietzsche on the thoughts of Pierre Lasserre especially in his *Romantisme français* (*RR* 243-252). The French built upon the ancients: G. May, "Contribution à l'étude des sources grecques de Phèdre" (*MLQ* 228-234), i.e., Racine's play and Heliodorus' novel; P. Morphopoulos, "L'image de la Grèce chez les voyageurs français" (Johns Hopkins thesis abstract), covering the 16-18 centuries; A. Schaffer compared "A Theocritean Idyll in French Poetry" (*MLN* 300-309) as used by Joséphin Soulary, Armand d'Artois, André Chénier; B. Hathaway's "The Lucretian *Return upon Ourselves* in Eighteenth-Century Theories of Tragedy" (*PMLA* 672-689) showed its evolution in France; G. May answered an emphatic "yes" to "Racine avait-il lu Ennius?" (*MLN* 461-465).

Spanish contributions to literary currency: M. Heiser traced the fame of "Cervantes in the United States" (*HR* 409-435), with its highpoint between 1790-1815; W. Vordtriede in "The Trial of Books in Goethe and Cervantes" (*MLN* 339-340) showed the borrowing in *Der Triumph der Empfindsamkeit;* J. Fucilla found "A travestied *Don Quijote*" (*Hisp* 336-340) in Nicola Limosino's poem "Don Chisciotte della Mancia"; F. Snow published a collaborative translation of Lope de Rueda's *Las aceitunas* (*MLJ* 98-102); J. Rundle and H. Lancaster took opposite sides on a Calderón borrowing (*MLN* 382-384, 385-389); J. Fellheimer asserted that Hellowes' and Fenton's translations of Guevara's *Epístolas familiares* (*SP* 140-156) gave general impetus rather than definite models to English letter-writers; M. Patchell wrote on *The Palmerin Romances in Elizabethan Prose Fiction* (Columbia); V. Erlick in "Beniowski and Don Juan" (*Sym* 2:87-98) discussed a literary parallel. Two Latin American items: J. Fucilla, "Bernardo de Balbuena's *Siglo de oro* and its sources" (*HR* 101-119), principally Sanazzaro and Virgil; G. Highet, "Classical Echoes in *La araucana*" (*MLN* 329-330), i.e., of Lucan.

LATIN LITERATURE [*]

By George Depue Hadzsits

Professor, University of Pennsylvania

PLACE OF THE CLASSICS IN EDUCATION

"The Humanistic Tradition in the Century Ahead" is an impressive statement of a memorable conference held at Princeton University (Princeton Univ. Press, Bicentennial conference, Series 1, Conference 6), cf., also, *The American Scholar* (vol. 16, no. 4) for the Forum, on *The Human-*

---

[*] Periodicals are abbreviated as follows: *AHR, American Historical Rev.; AJA, American Journal of Archaeology; AJP, American Journal of Philology; CB, Classical Bulletin; CJ, Classical Journal; CO, Classical Outlook; CP, Classical Philology; CQ, Classical Quarterly; CR, Classical Rev.; CW, Classical Weekly; HSCP, Harvard Studies in Classical Philology; HThR, Harvard Theological Rev.; Is., Isis; JHI, Journal of History of Ideas; JRS, Journal of Roman Studies; Lang., Language; PhQ, Philological Quarterly; Spec., Speculum; PAPA, Proceedings of the American Philological Association; TAPA, Transactions of the same; Verg., Vergilius; YCS, Yale Classical Studies* (all references are to 1947).

Bibliographical information will be found in lists of "Recent Publications," appearing in *CW*, and in "Recent Books," listed in *CJ*, as well as under "Classical Articles in Non-Classical Periodicals" which *CJ* also publishes.

ities, Today and Tomorrow, with Edmunds O'Gorman's severe criticisms of Princeton's "The Humanistic Tradition, etc."

Norman Foerster's *The Future of the Humanistics in State Universities* is a book which should be "required reading" for everyone at all interested in education; it is a biting and satiric condemnation of the neglect of the Humanities (see review, *CJ* 43, 27-30).

In the Spring number (1947) of *The American Scholar* (16, 137-139), Max Lerner writes on "A Tragic Humanism," which is a challenge to American Education and, not least, to Classical scholars.

"Toward Improvement of the High School Latin Curriculum," (*CJ* 43, 67-90) is by the Committee on Educational Policies of the Classical Association of the Middle West and South.

"W. Kirkconnell and A. S. P. Woodhouse, *The Humanities in Canada* (Humanities Research Council of Canada, Ottawa) plainly shows that the Harvard General Education has not been accepted in Canada (see rev., *CJ* 43, 188-189).

"General Language Courses in Colleges and Secondary Schools" (*CJ* 42, 419-424) by J. W. D. Skiles, is concerned with objectives, with valuable bibliography.

"What Language Do You Speak?" is an excellent review of the history of the English language, with due attention paid to the influence of Latin upon its development (F. S. Dunham, in *CJ* 42, 455-464, with bibliography).

A NEW PROGRAM

In "A Point of Order," Prof. W. L. Carr again urges the necessity of following the cogent advice of Professor Hale who, more than 50 years ago, advocated the proper method of reading, in his "The Art of Reading Latin" (*CW* 41, 9-14). No one, today, argues the point, that we should speak Latin, more convincingly than Goodwin B. Beach (cf. his *Nihil est quod Latine dici non possit* (*CW* 40, 42-45).

A Eulogy—"Arcadius Avellanus—Erasmus Redivivus," who spoke Latin as a living language, and from whose example classicists must profit today if they would save Latin for American education (G. B. Beach, in *CJ* 42, 505-510).

Prof. F. B. Krauss defends Latin conversation in the classroom, ably and wisely: "Loquarne Linguis Hominum aut Disertorum" (*CW* 40, 154-160, 162-164) "The language is dying, imprisoned in the minds of grammarians; it can come forth and live only on the lips of students and of scholars."

LITERATURE AND LINGUISTICS

"Censorship in Republican Drama" is discussed by Laura Robinson, who reminds her readers that Roman public opinion favored free speech but that personal attacks upon magistrates on the state-supported stage were dangerous. This, therefore, resulted in a limited right of free speech. Naevius' imprisonment was a warning to Plautus. The Mime was allowed greater liberty (see *CJ* 42, 147-150).

J. P. Elder's "Catullus' *Attis*" properly defends Catullus as an imaginative poet and not, merely, a translator of Callimachus (*AJP* 68, 394-403).

A new edition of Lucretius is announced by the Oxford University Press, with Text, Critical Apparatus, and Commentary, prepared by the eminent English scholar, Cyril Bailey. Its arrival and use in this country is looked forward to, with great interest.

"Progress and Primitivism in Lucretius," by Margaret Taylor (*AJP* 68, 180-194) is valuable, not only for a review of other scholars' conclusions, but also for its stress on the gains for mankind, as Epicureans saw it, due to Epicurean philosophy.

"The Tale of Troy: An Early Romantic Approach" by Prof. E. H. Haight, pursues her favorite theme of Romance in Classical literature, as she explores the romantic element in the little-known *Ephemeris Belli Trojani* of Dictys of Crete, which Miss Haight regards as a Latin version of a lost Greek novel (*CJ* 42, 261-269).

"Horace's First Roman Ode," by Fr. Solmsen (*AJP* 68, 337-352) argues for the theory that we have, here, Horace's personal and most intimate pre-occupation with the eternal verities.

Prof. A. P. McKinlay argues in favor of Horace's moderation, in "The Wine Element in Horace" (*CJ* 42, 161-168; 229-235, with important bibliography). "Menander at the Sabine Farm" raises the question what use Horace made of the Greek Menander (E. H. Haight, in the *CP* 42, 147-155).

In the *Philological Quarterly* (vol. 26, no. 3, 268-284), Professor Regenos writes, interestingly, about "The Influence of Horace on Robert Herrick."

Professor H. Fränkel's important *Ovid, A Poet Between Two Worlds* receives a notably able review (*CP* 42, 57-61) by Brooks Otis who analyzes Ovid's appeal through the ages and, with discrimination, disagrees with some of Fränkel's views.

Miss Bertha Marti follows up her remarkable essay on "Seneca's Tragedies—A New Interpretation" (see THE AMERICAN YEAR BOOK, 1946, 922) with another study, "The Prototypes of Seneca's Tragedies" (*CP* 42, 1-16), in which she develops the theme that all of these tragedies were problem plays, intended to be read and to instruct.

Prof. W. C. Korfmacher's "Pliny and the Gentleman of Cicero's *De Officiis*" (*CW* 40, 50-53), is an excellent evaluation of the "gentleman" idea in two important Roman authors.

The "Rand" *Servius* deserves special notice, as a great monument of classical scholarship (see rev. *CO* 25, 9 by Professor Ullman).

A very important work is that of Marcel Renard: *Initiation à l'Étruscologie* (rev. *CW* 41, 75-76), which all classical students should know.

HISTORY, LAW, POLITICS, COMMERCE AND FINANCE, SOCIOLOGY

"The Survival of the Roman Empire" is a wise pronouncement upon the ancient ideal of organizing "humanity in the boundless majesty of peace." Prof. Eva M. Sanford is an eloquent exponent of the concept of "One World" and would have us learn the lessons of history for our present needs (*CW* 41, 52-56). She also discusses "The Destruction of Ancient Rome" wittily and intelligently (*CW* 40, 122-127, 130-133).

"An Ancient *Cause Célèbre*" calls attention to Cicero's *Pro Cluentio* and the frightening and scandalous, the notorious and sensational careers of Oppianicus and Sassia, and to poison and murder in Rome in Cicero's day—a chapter in *Sociology and the Law* (*CJ* 42, 415-418, E. C. Woodley).

Studies in the History of Roman Seapower in Republican Times, is by J. H. Thiel (Amsterdam) (rev., *CP* 42, 257-260, C. G. Starr).

A Project for the Translation of Roman Law is announced (*CJ* 42, 141-146) by Professor Clyde Pharr. This ambitious program includes publication of an authoritative text of the *Corpus Iuris Romani*, accompanied by an English translation, and provides for a distinguished editorial board.

Prof. Clark Hopkins writes informatively on "The Siege of Dura," the site of Professor Rostovtzeff's dramatic excavations. This article gives a vivid account of Dura's commercial, military, and religious significance (*CJ* 42, 251-259) from the third century B.C., into the second and third centuries A.D.

"The Personality of the Mints, Under the Julio-Claudian Emperors," by C. H. V. Sutherland (*AJP* 68, 47-63), clearly demonstrates the value of the study of coins for the study of Roman history and pays a high compliment to the superb British Museum Catalogues of Mattingly.

In "Nero Fiddled While Rome Burned," Miss Mary F. Gyles argues for Nero's use of a *cithara* while he sang of "the Fall of Troy" (*CJ* 42, 211-217).

"Toscaninis of Two Thousand Years Ago" (*CO* 25, 1-2), by John J. Jolin, is as interesting as it is instructive.

The witty article of E. S. McCartney, "The Quoting of Proverbs and Maxims as a Social Grace and Fault" (*CW* 40, 74-76) should be widely read and his "A Bibliography of Collections of Greek and Roman Folklore" (*CW* 40, 99-101) is invaluable.

"The Kiss, in Roman Law" (*CJ* 42, 393-397), by Mary Brown Pharr, deals with the less well known but very interesting topic of ceremonial kisses, betrothal, contractual, and gift-giving, etc.

ARCHAEOLOGY INSCRIPTIONS, PAPYRI

A report appears (*CJ* 42, 155 seq.) on a pagan cemetery of the second-third centuries, A.D., astonishingly well-preserved, showing a narrow street, lined on both sides with typical Roman tomb structures which contain sarcophagi and sepulchral urns. The inscriptions reveal the familiar phrases of family devotion, frequently found on tombstones. The locale of this intensely interesting find is indicated in the title of the descriptive article: "Roman Tombs Beneath the Crypt of St. Peter's."

T. C. Lethbridge, of Cambridge University, reports on a "Treasure Trove in Britain" (see *CJ* 42, 282-286). Both of these discoveries were made in East Anglia, in the county of Suffolk, and include an Anglo-Saxon galley, amidships of which a mass of weapons was found, as well as gold personal ornaments and silver dishes, all for use in the next world; a great hoard of fourth century Roman silver, a Roman treasure, which seemingly had been buried in the ground for safe-keeping, near a Roman-British house, at the time of the Anglo-Saxon invasion.

"Roman London," is by W. F. Grines of the London Museum (*CJ* 42, 379-382) is an important work; also "A Stroll around the Roman Forum," by Shirley Smith (*CJ* 42, 486-492). "Rambles among Latin Inscriptions" A. E. Gordon (*CJ* 42, 151-155), is interesting and popular in the best sense. "More Rambles among Latin Inscriptions," by A. E. Gordon (*CJ* 42, 493-96), deals with such themes as life, death, love, wine, women, and song.

"Who Read Virgil in Zin?" is the intriguing title of an article by H. D. Colt, on papyri found at Auja, an ancient fortress on the southern border of Palestine, built by Theodosius I at the end of the fourth century against the Arabs. These documents deal with historical, economic, social, and literary matters, as, *e.g.*, a seventh-century codex MS of the *New Testament* (see *CJ* 42, 315-323).

P. Collart, "Les Fragments des Tragiques Grecs sur Papyrus" is a complete list, to date, giving 155 fragments of plays as found in Egyptian papyri. The article gives full information about the fragments and their sources (*CW* 40, 119).

C. H. Beeson, "The MSS of Bede" (*CP* 42, 73-87) is a remarkable study. Blanche B. Boyer, "Insular Contribution to Mediaeval Literary Tradition on the Continent" (*CP* 42, 209-222), stresses the prodigious activity of Irish and Anglo-Saxon scribes, both at home and abroad.

FINALIA

The wide range of the following studies shows the versatility and the vitality of classical scholarship.

Prof. A. W. Van Buren's "War-Time Productivity in Italy" (*AJP* 68, 1-20) is an astounding story of what Italian scholars accomplished during the years 1940-July 1946; great names appear, as Bignone, Lugli, Maiuri, deSanctis—proofs of heroic courage under most adverse circumstances and of intense interest in all phases of antiquity (cf. *CW* 40, 67, on life of Pompeii, during wartimes, and the dangers experienced by Della Corte).

We are constantly receiving books, and news about books published abroad during the hardships of war (see *CP* 42, 135 seq.) E. Bignone, *Storia della Letteratura Latina* (3 vols., Firenze) (for rev., *CR* 61, 62-64); R. Bloch, *Les Origines de Rome,* Paris; M. van den Bruwaene, *Études sur Cicéron, Bruxelles* (cf., also, *CW* 40, also pp. 48, 56, 63-64).

The *Classical Journal* publishes a valuable "A Check List of Recent Books" (*CJ* 43, 118-122), including, among others: a new Roman edition of Lucretius; the new Rand *Servius,* published by the American Philological Association; H. W. Garrod, *Scholarship; Its Meaning and Value;* D. P. Harding, *Milton and the Renaissance Ovid* (see rev., *CP* 42, 132-133); H. Mattingly, *Man in the Roman Street;* H. A. Sanders, *Latin Papyri in the University of Michigan Collection* (*CJ* 43, 185-186); the new Ernout: *Lucrèce;* H. J. Haskell, *The New Deal in Old Rome* (Knopf, N. Y., 1947), which receives high praise from the eminent English scholar, Hugh Last.

Honor Volume of Classical Essays to James A. Kleist, Classical Essays (St. Louis University, 1946) (rev., *CJ* 42, 374-375). Such volumes, evidence of affectionate appreciation of a scholar's service, are always welcome. This one has several essays, contributed by well-known classicists, covering a wide field, varying from Homer to the Church's debt to Homer. Father Sullivan's "Virgil's Mezentius" is of special importance for teachers of Virgil (*CW* 41, 109-111).

From Pretoria, South Africa, comes a distinguished volume: *Christians and Pagans, from Constantine to St. Augustine,* Part I. *The Religious Policies of the Roman Emperors* (Union Booksellers), by H. Muller.

Equally notable is the wartime book, *Phyllobolia, für Peter Von der Mühl,* published in Basel, Switzerland, containing five essays (see rev., *CP* 42, 127-130), by Swiss scholars, including "Tacitus u.die antike Schicksalslehre." This learned dissertation argues that Tacitus followed (in the main) the Stoic doctrine—in his beliefs concerning the relation of the individual to Fate.

Mémorial des Études latines is an honor volume dedicated to a great French scholar, Marouzeau, who founded the *Société des Études latines* and its *Revue* (an excellent review of the *Memorial* and of Marouzeau's work appears in the *AJP* 68, 108-109). Each article in the *Memorial* gives a summary of progress in its field, and there are 37 such articles.

Important, scholarly articles continue to appear: "Notes on Roman Magistrates," (*TAPA* 77, 35-43) by T. R. S. Broughton. "Stoic *Apatheia* and Seneca's *De Clementia,*" (*TAPA* 77, 44-52) by W. C. Korfmacher, which shows the conflict, within Stoicism, between theory and practice. "Octavia's Deification at Athens" (*TAPA* 77, 146-150) by A. E. Raubitschek. "Land and Sea Transportation in Imperial Italy" (*TAPA* 77, 220-244) by Cedrick A. Yeo, is an extremely interesting discussion of the difficult problem of costs of transportation. "Linking the Old and the New in Italy" is a charming discussion of many habits inherited from ancient times and still observed in Italy today. Prof. B. McDaniel is a foremost exponent of such invaluable data (*CW* 40, 90-95; 41, 3-9). "Philosophic Doctrine and Poetic Technique in Ovid," is by Phillip DeLacy (*CJ* 43, 153-161). "The Early Roman Calendar," a very careful study of an extremely difficult subject (*CJ* 43, 163-168), by B. M. Allen, who argues thorny problems with the eminent English scholar, H. J. Rose. "Julian Dates and Greek Calendars" (*CP* 42, 235-243) is by W. K. Pritchett.

GREEK LITERATURE

By Royal Case Nemiah
Professor, Dartmouth College

GENERAL

The increase of interest in Greek studies, predicted in the article on "Greek Literature" in The American Year Book for 1946 (p. 925), has been conspicuous, as well as the attendant increase in the quantity and quality of scholarly activity in this field. Excavation has been resumed in various areas, thus assuring to scholars the raw material for their research. The continued appearance on the commercial stage of plays based on Greek themes is an indication of interest, or at least curiosity, as to things Hellenic. Too much praise can not be given to scholars of foreign birth, who are adding so much to the depth and breadth of Greek scholarship in America by their publications in our journals.* Noteworthy also is the appearance of two volumes in the Loeb Library (Harvard Univ. Press, 1946): *Diodorus Siculus* (vol. 4) translated by C. H. Oldfather and *Dio Chrysostom* (vol. 4) translated by H. L. Crosby.

THE GREEK LANGUAGE

In the field of general language study should be mentioned *An Introduction to Linguistic Science* by E. H. Sturtevant (Yale Univ. Press, 1947). *A Reading Course in Homeric Greek. Second Year Book* by R. V. Schoder and V. C. Horrigan (Chicago, Loyola Univ. Press) is a continuation of the book noticed in The American Year Book for 1946 (p. 925). E. C. Colwell and J. R. Mantey are the editors of *A Hellenistic Greek Reader* (Univ. of Chicago Press, 1947). At the same press in 1947 was published A. Wikgren's *Hellenistic Greek Texts*. G. M. Bolling writes on "Personal Pronouns in Reflexive Situations in the Iliad" (*Language*, 23, 23) and G. M. Messing on "The Etymology of Greek *ho, he, to deina* (*ibid.* 23, 207). J. N. Hough has a good article on literary technique entitled "Terence's Use of Greek Words" (*CW*, 41, 18). An excellent essay on the classical elements in English is F. S. Dunham's "What Language Do You Speak?" (*CJ*, 42, 455).

HOMER AND HESIOD

Significant of contemporary literary taste and public demand is the publication by the Penguin Books Inc. (New York, 1946) of E. V. Rieu's translation of the *Odyssey*. The sales are reported to be good. In his review of it (*CJ*, 43, 111), F. M. Combellack calls it "good bronze for Homer's gold." There is an excellent article by the poetess, J. Ingalls, entitled "Structural Unity of the Iliad" (*CJ*, 42, 399). A good article by E. F. D'Arms and K. K. Hulley, "The Oresteia Story in the Odyssey" (*TAPA*, 77, 207), states that the frequent comparison of Odysseus and his family with the family of Agamemnon is intended to glorify a relatively unimportant family by comparison with the great. A. Feldman, in his "The Apotheosis of Thersites" (*CJ*, 42, 219), shows that Thersites was not a proletarian but of noble birth. His harsh speech in the second book of the *Iliad* was the result of private grudge. The same author, in "Indians and the Iliad" (*CJ*, 43, 19), shows similarities between the folkways of the Homeric Greeks and those of the American Indians. J. Duffy, in "Homer's Conception of Fate" (*CJ*, 42, 477), maintains that "Fate and the will of Zeus are identical." R. McCain, in "English Renderings of *Noon Egno*" (*Odyssey*, I, 2), presents many versions of this phrase in the works of English translators from the Elizabethan Age to our own time (*CJ*, 42, 433). A. Nehring, in "Homer's Descriptions of Syncopes," shows that Homer's "descriptions of fainting spells follow clear types and patterns." A good article about an author too little studied is F. J. Teggart's "The Argument of Hesiod's *Works and Days*" (*JHI*, 8, 45). H. N. Porter's "Hesiod and Aratus" (*TAPA*, 77, 158) is a study of the influence of Hesiod's metrical forms on the work of Aratus.

---

* Abbreviations: *AJA, American Journal of Archaeology; AJP, American Journal of Philology; CJ, Classical Journal; CP, Classical Philology; CW, Classical Weekly; HTR, Harvard Theological Review; Hesp., Hesperia; JHI, Journal of the History of Ideas; TAPA, Transactions of the American Philological Association.* Titles of books, monographs, and periodicals are italicized; those of articles are in quotation marks.

LYRIC AND DRAMATIC POETRY

A useful book for classroom use is J. A. Moore's *Selections from Elegiac, Iambic, and Lyric Poets* (Harvard Univ. Pr., 1947). R. Lattimore's translation, *The Odes of Pindar* (Chicago Univ. Press, 1947), is brilliant. H. Fränkel's article, "Man's 'Ephemeros' Nature According to Pindar and Others" (*TAPA*, 77, 131), shows that in early Greek literature the word *ephemeros* did not mean "short-lived" but "subject to the day," "variable"; an appendix lists various connotations of the word. In "The First Elegy of Solon" (*AJP*, 68, 161), R. Lattimore gives a scholarly "explication" of that poem. E. Riess discusses Theognis, Semonides of Amorgos, and Hipponax in his article "On Some Passages from the Greek Lyrics" (*CW*, 41, 59).

A growing interest in Greek drama is apparent. Under the able editorship of Dudley Fitts, *Greek Plays in Modern Translation* (Dial Press, 1947) makes available some of the best Greek plays in the versions of some of the ablest translators of our time. R. A. Brower studies the problem of translation by considering six translations of the *Agamemnon* of Aeschylus and comparing them with the original ("Seven Agamemnons," *JHI*, 8, 383). P. C. Wilson, in "Notes of Freedom Sounded by Aeschylus" (*CJ*, 42, 383), deals with the problems of freedom from slavery, freedom of self-rule, intellectual freedom, and freedom of the administration of justice. The same writer, in a note on Aeschylus' *Eumenides* (881-891), holds that Athena is trying to *persuade* the Erinyes, indicating that "victory by persuasion,—reconciliation, may bring about a union mightier than any triumph" (*CP*, 42, 122).

In "Anouilh's *Antigone* Again" (*CJ*, 42, 207), A. C. Schlesinger writes that the important element in the *Antigone* is not the conflict between divine and human law but the character of A. In "Sophocles, Antigone 904-20" (*CP*, 42, 51), R. E. Wycherley discusses the authenticity of these verses. H. F. Graham contributes an interesting note in "The 'Escape' Ode in *Hippolytus* 732-775" (*CJ*, 42, 275). In his "Echi del Rito Eleusinio" (*AJP*, 68, 82), B. Lavagnini points to references to the Eleusinian mysteries in Euripides' *Suppliants* (53, 470).

The following performances, based on translations or versions of Greek plays, were given during 1947: J. P. Sartre's *The Flies* (*Les Mouches*) based on the *Oresteia* of Aeschylus; a film version of O'Neill's *Mourning Becomes Electra,* dealing with the same theme; Anouilh's *Antigone* at Smith College; Shelley's translation of the *Cyclops* of Euripides at Bowdoin College in honor of Prof. T. Means; Robinson Jeffers' *Medea;* Euripides' *Trojan Women* at Western College (Oxford, O.); while the Boston College Dramatic Club gave Euripides' *Alcestis* in the original Greek. A study in the survival of Greek tragedy is B. M. Marti's "The Prototypes of Seneca's Tragedies" (*CP*, 42, 1).

Comedy, as usual, received less attention than tragedy. H. W. Miller writes on "Some Tragic Influences on the Thesmophoriazusae of Aristophanes" (*TAPA*, 77, 171): "It is the purpose of this paper to note a number of passages in the T. in which tragedy affected the composition of the passage, to indicate the source of the tragic influence, and to analyze its effect upon the style of Aristophanes." By the same author is "On the

Parabasis of the Thesmophoriazusae of Aristophanes" (*CP,* 42, 180), showing how it was influenced by Euripides' *Melanippe Desmotis. Post-Aristophanic Comedy* (Illinois Studies in Language and Literature, xxxi, Nos. 3, 4) is an investigation of the social outlook of middle and new comedy at Athens and Rome. "Comedy and the Comic Poets in the Greek Epigram," by J. M. Raines (*TAPA,* 77, 83), discusses "such Greek epigrams as deal with comedy and the comic poets from the point of view of literary criticism."

MISCELLANEOUS AUTHORS

W. K. Prentice (*AJP,* 68, 73) believes that the ascription of Xenophon's *Anabasis* to an actual Themistagenes as author, or to his name as pseudonym, was due to a misreading of the MS. H. Fränkel, in a "Note on the Closing Sections of Pseudo-Xenophon's Constitution of the Athenians" (*AJP,* 68, 309), interprets the words "dikaios" and "adikos" as meaning "advantageous" and "harmful" to the proletariat. L. W. Daly, in "The Greek Version of Caesar's *Bellum Gallicum,*" attributes this translation to Piero Strozzi, a Florentine professional soldier in French service, rather than to Planudes, as has usually been done. M. Hadas states in "The Religion of Plutarch" (*South Atlantic Quarterly,* 46, 84) that Plutarch's religion was Greek culture. T. Means, in "Plutarch on the Death of Cyrus" (*CW,* 41, 39), asserts that Ctesias was P's source in his *Life of Artaxerxes.* R. Pack in "Notes on the 'Caesars' of Julian" (*TAPA,* 77, 151) shows the relationship between this satire and the Apostate's *Orations,* so important for a knowledge of his Neoplatonism. In the field of New Testament studies should be mentioned B. M. Metzger's *Lexical Aids for Students of New Testament Greek* (Princeton Theological Seminary, 1946); also the stylistic and linguistic notes of R. C. Horn in "Some Notes on the Gospel According to St. Mark (*CW,* 40, 134). C. E. Lutz's "Musonius Rufus, 'The Roman Socrates,'" is a Greek text of this Roman Stoic of the 1st century A.D., with translation and copious notes (*Yale Classical Studies,* 10, 1947).

PHILOSOPHY

Much good work was done in the field of philosophy during the year. There is an excellent article by A.-H. Chroust entitled "Philosophy: Its Essence and Meaning in the Ancient World" (*Philosophical Review,* 56, 19), and in the same journal (56, 127), P. T. Rajn's "The Western and the Indian Philosophical Traditions." G. Vlastos is the author of "Parmenides' Theory of Knowledge" (*TAPA,* 77, 66), in which he discusses fragment 16 of Parmenides as part of his doctrine of sense perception, not of the theory of knowledge.

H. Cherniss has done a most valuable piece of work in his two installments of "Some War-time Publications Concerning Plato" (*AJP,* 68, 113; 68, 225), covering the major work done in the field of Platonic scholarship both here and abroad. *The Doctrine of the Imitation of God in Plato* appeared at the King's Crown Press (New York, 1946). Two good articles in a journal full of excellent work are P. Merlan's "Form and Content in Plato's Philosophy" (*JHI,* 8, 406) and M. Beck's "Plato's Problem in the Parmenides" (*ibid.* 8, 232). In her "A Note on the Timaeus of Plato" (*CW,* 40, 133), F. B. Anderson points out that in this dialogue, according to Plato, God is without envy. An old, but ever new, theme is treated by W. B. Ready in "Plato and the Essential Education" (*Education,* 68, 11). Important is J. P. Maguire's "Plato's Theory of Natural Law" (*Yale Classical Studies,* 10, 1947).

Much excellent work has been done on Aristotle. Outstanding here are G. Boas' "Aristotle's Presuppositions about Change" (*AJP,* 68, 404), R. McKeon's "A's Conception of the Development and the Nature of Scientific Method" (*JHI,* 8, 3), and the same author's two installments of "A's Conception of Language and the

Arts of Language" (*CP*, 41, 193; 42, 21); P. Merlan's "A's Unmoved Movers" (*Traditio*, 4, 1); and A. H. Gilbert's "A's Four Species of Tragedy (*Poetics* 18) and their Importance for Dramatic Criticism" (*AJP*, 68, 363). An interesting article chiefly on Aristotle's zoölogical writings by a biologist who is also a humanist is T. S. Hall's "The Twentieth Century Biologist Rereads His Aristotle" (*CJ*, 43, 13). Also appeared L. Cooper's *Aristotle on the Art of Poetry* (Cornell Univ. Pr., 1947) and the same author's "'Hamartia Again'—And Again" (*CJ*, 43, 49), in which he reiterates his statement that characters in tragedy suffer as the result of moral flaws.

In an article entitled "The Successor of Speusippus" (*TAPA*, 77, 103), P. Merlan shows that Aristotle was eligible for the headship of the Academy at the death of Plato's successor, Speusippus. M. T. Herrick is the author of *The Fusion of Horatian and Aristotelian Literary Criticism, 1531-1555. Illinois Studies in Language and Literature* (Univ. of Illinois Press, 1946). Two excellent articles on Epicurus are N. W. DeWitts' "Epicurus: Philosophy for the Millions" (*CJ*, 42, 195) and J. H. Turner's "Epicurus and Friendship" (*CJ*, 42, 351). Two studies in Stoicism are W. C. Korfmacher's "Stoic 'Apatheia' and Seneca's *De Clementia* (*TAPA*, 77, 44), a study of origins and survivals; and R. W. Pack's "Two Sophists and Two Emperors" (*CP*, 42, 1), dealing with Marcus Aurelius and Aelius Aristides, Julian and Libanius.

A good article in the field of aesthetics is M. C. Nahm's "The Theological Background of the Theory of the Artist as Creator" (*JHI*, 8, 363). A very important work is H. A. Wolfson's *Philo* (Harvard Univ. Press, 1947), a study of the development of Philo's thought, which became the basis of Christian, Jewish, and Moslem philosophy. Finally, a charming article by C. Murley entitled "In Praise of the Less Abundant Life" (*CJ*, 42, 331), dealing with aspects of Greek thought through a study of Greek uses of the negative. A summary, with apologies, might run: Sweet are the uses of adversatives.

HISTORY AND CHRONOLOGY

The meager amount of activity in the field of Greek history is surprising in an age of social science. G. Bonfante, in "Who Were the Philistines?" treats the subject from the point of view of ethnology and origins (*AJA*, 50, 251). A discussion based chiefly on epigraphic data is W. Wallace's "The Demes of Eretria" (*Hesp.*, 16, 115). C. Edson's "Notes on the Thracian *Phoros*" deals with the extent of Athenian control in the Thermaic Gulf (*CP*, 42, 88). A. Billheimer, in "Ta Deka aph' Hebes" (*TAPA*, 77, 214), states that the phrase means "the first ten year-classes." Two biographies of Alexander the Great are H. Lamb's *Alexander of Macedon* (Doubleday, 1946) and *Alexander the Great* by C. A. Robinson (Dutton, 1947). A good book in a field about which too little is known is E. V. Hansen's *The Attalids of Pergamon* (Cornell Univ. Pr., 1947).

The chronology of the prehistoric age is treated in S. S. Weinberg's "Aegean Chronology: Neolithic Period and Early Bronze Age" (*AJA*, 51, 165). W. K. Pritchett and W. Neugebauer are the authors of *The Calendars of Athens* (Harvard Univ. Press, 1947). By Pritchett also is "Months in Dorian Calendars" (*AJA*, 50, 358). In "The Intercalary Year 157-6" (*Hesp.*, 16, 224), J. H. Kent concludes from inscriptional evidence that this year was intercalary. In "L'Archonte Athénien Dioclès (139-138 B.C.), G. Daux discusses the date of Diocles (*Hesp.*, 16, 55). B. D. Meritt discusses the same period in his "The Attic Archons Diokles-Timarchos" (*AJP*, 68, 195). W. K. Pritchett, in "Julian Dates and Greek Calendars" (*CP*, 42, 235), criticizes W. B. Dinsmoor's "Archaeology and Astronomy" (*TAPA*, 70, 95) and rejects archaeology as a handmaid of the calendar in favor of astronomy. J. A. Notopoulos, in "The Date of the Creation of Hadrianis" (*TAPA*, 77, 53), maintains that in the year 126/7 the Athenian tribe Hadrianis was created and the Athenian Council reduced from 600 to 500.

RELIGION AND MYTHOLOGY

An interesting article on religious history is G. Chittenden's "The Master of Animals" (*Hesp.*, 16, 89), in which, through the evidence of art, he traces the tradition of Hermes from Minoan to classical times. F. Solmsen has an important article entitled "Strata of Greek Religion in Aeschylus" (*HTR*, 40, 211). M. P. Nilsson, in "The Dragon and the Treasure" (*AJP*, 68, 302), shows that the idea of the dragon as protector of treasure has its origin in the cult of Asclepius. In "Apollon Onos" (*CP*, 42, 223), A. H. Krappe states that there was an Apollo cult among the Hypoboreans of the North Sea coast and that the sacrificial animal of the deity was an ass. H. R. Immerwahr, in "Choes and Chytroi" (*TAPA*, 77, 245), proves from vase paintings that the Dionysiac revelries of the Choes (the second day of the Anthesteria festival) were carried over to the beginning of the Chytroi (the third day). A. E. Raubitschek shows by inscriptional evidence (*TAPA*, 77, 146) that Anthony and Octavia were worshipped at Athens in 39/8 B.C. as gods. A passage from the *Suasoriae* of the elder Seneca (1, 6-7) suggests that Octavia was identified with Athena Polias. An important article of M. P. Nilsson's is "Greek Mysteries in the Confession of St. Cyprian" (*HTR*, 40, 167). G. B. Schwab's *Gods and Heroes*, long known in Germany, now appears in an English translation by O. Marx and E. Morwitz, beautifully printed and illustrated with reproductions from vase paintings (New York, Pantheon Press, 1946).

ART AND ARCHAEOLOGY

Increased activity in the domain of art and archaeology is a cheering evidence of the end of the war. In the prehistoric field should be noted H. J. Kantor's "The Aegean and the Orient in the Second Millennium B.C. (*AJA*, 51, 1). J. L. Heller's "Labyrinth or Troy Town" (*CJ*, 42, 123) shows that "a peculiar geometrical design is associated with the Labyrinth of Cnossus, the walls of Troy, the evolutions of a Greek dance, and a game performed by Roman youths on horseback." "Eleusis and the Eleusinian Mysteries" (*CJ*, 43, 131) is an archaeological treatment of this interesting subject. E. P. Blegen's "News Items from Athens" (*AJA*, 50, 370) is an account of the present state of archaeology in Athens. W. B. Dinsmoor writes on "The Hekatompedon on the Athenian Acropolis" (*AJA*, 51, 109). H. A. Thompson's "The Excavation of the Athenian Agora 1940-1946" (*Hesp.*, 16, 193) is a review of the work on that site. G. M. A. Richter discusses "An Athenian Gravestone" (*Bull. Met. Mus. of Art*, *5*, 179).

D. H. Robinson reports on *Excavations at Olynthus, Pt. XII: Domestic and Public Architecture* (The Johns Hopkins Univ. Studies in Archaeology, No. 36. Johns Hopkins Univ. Press). From discoveries made in 1946, O. Broneer writes on "The Corinthian Altar Painter" (*Hesp.*, 16, 214). Further reports on the work at Dura-Europos are made by N. P. Toll in *The Excavations at Dura-Europos—1935-6; Part 2, The Necropolis* (Yale Univ. Pr., 1946). C. Hopkins writes on "The Siege of Dura" (*CJ*, 42, 251), an account based on archaeological evidence of the siege of Dura-Europos of which no ancient written or epigraphical record survives. G. M. A. Richter discusses "A Fourth Century Bronze Hydria in New York" (*AJA*, 50, 361). G. H. McFadden is the author of "A Tomb of the Necropolis of Ayios Ermoyenis at Kourion" (*AJA*, 50, 449). An interesting article is F. A. Norwood's "Attitude of the Ante-Nicene Fathers toward Greek Artistic Achievement" (*JHI*, 8, 431). G. Downey writes "On Some Post-Classical Greek Architectural Terms" (*TAPA*, 77, 22). O. Waldhauer discusses "Myron's Anus

Ebria and the Drunken Woman in Munich" (*AJA,* 50, 241).

In the field of Ceramics are to be noted G. M. A. Richter's *Attic Red-Figured Vases, A Survey* (Yale Univ. Pr. 1946); D. Von Bodmer, "The Taleides Amphora (550-525)" (*Bull. Met. Mus. of Art, 5,* 221); also his "An Amphora of the Polyphemos Group" (*ibid.* 5, 131); M. J. Milne, "Peleus and Akastos" (*ibid.* 5, 255); D. K. Hill, "What the Women Did" (*CJ,* 42, 202); V. Grace, "Wine Jars" (*CJ,* 42, 443); and L. B. Lawler, "A Dancer's Trophy" (*CW,* 41, 50).

INSCRIPTIONS

In the field of inscriptions the following articles should be noted: J. S. Creaghan and A. E. Raubitschek, "Early Christian Epitaphs from Athens" (*Hesp.,* 16, 1); M. and E. Levensohn, "Inscriptions on the South Slope of the Acropolis" (*Hesp.,* 16, 63), with notes by W. R. Merkel (*ibid.* 75); C. P. Loughran and A. E. Raubitschek, "Three Attic Proxeny Decrees" (*Hesp.,* 16, 78); B. D. Meritt, "An Athenian Treaty with an Unknown State" (*AJP,* 68, 312); "Greek Inscriptions" (*Hesp.,* 16, 147); and "The Persians at Delphi" (*Hesp.,* 16, 58); M. T. Mitsos, "Greek Inscriptions" (*Hesp.,* 16, 82); W. K. Pritchett, "Greek Inscriptions" (*Hesp.,* 16, 184); C. B. Welles, "The Garden of Ptolemagrius at Panopolis" (*TAPA,* 77, 192), a discussion of a fragment found at Panopolis (Egypt) in 1938. In the field of papyrology, E. H. Gilliam's "The Archives of the Temple of Soknobraisis at Bacchias" is a study of these documents with translation and commentary (*Yale Classical Studies,* 10, 1947).

MISCELLANEOUS

In this section are noted books and articles on a wide variety of subjects not classifiable under the above sections. A. E. Kober attacks the difficult but most important problem of deciphering the Minoan language in "Inflection in Linear Class B: 1. Declension." (*AJA,* 50, 268). A very interesting volume of essays on Greek culture (history, literature, geography), is V. Ehrenberg's *Aspects of the Ancient World* (Salloch, New York, 1946). L. B. Lawler continues her studies on the Greek dance in "A 'Mortar Dance'" (*CJ,* 43, 34), "The Geranos Dance—a New Interpretation" (*TAPA,* 77, 112), and "The Dance in Ancient Greece" (*CJ,* 42, 343). D. G. Burrage writes on "Education in the Homeric Age" (*CJ,* 43, 147).

In "Papyri in Classical Education" (*CJ,* 43, 12) A. W. Calhoun discusses the importance of papyri as throwing light on the New Testament and suggests the value of an elementary Greek book based on the papyri. Two articles on ancient law are H. J. Wolff's "The Origin of Judicial Litigation among the Greeks (*Traditio,* 4, 31) and E. W. Lacy on "Law and Justice in Antiquity and the Middle Ages" (*JHI,* 8, 373). W. H. S. Jones is the author of "Philosophy and Medicine in Ancient Greece with an Edition of 'Peri Archaies Ietrikes'" (*Bull. of the History of Medicine,* Supp. 8. Johns Hopkins Press, 1946).

In the field of music is "The Auloi of Meroë" by N. B. Bodley (*AJA,* 50, 217). In numismatics is to be noted P. W. Lehman's *Statues on Coins of Southern Italy and Sicily in the Classical Period* (New York, H. Bittner & Co., 1946). W. W. Hyde writes on *Ancient Greek Mariners* (New York, Oxford Univ. Press, 1947). A Greek survival is discussed by T. S. Brown in "Greek Influence on Tiberius Gracchus" (*CJ,* 42, 471). In *Plato and Milton,* I. Samuel discusses a problem in comparative literature. (Cornell Univ. Pr., 1947). A. C. Schlesinger is the author of "Can We Moderns Write Tragedy?" (*TAPA,* 77, 1).

In "The Genesis of Neoclassical Tragedy" (*South Atlantic Quarterly,* 46, 93), E. Roditi shows that the Italian tragedians of the sixteenth century, in following the principles of Aristotle's *Poetics,* led to Elizabethan and French neoclassical tragedy.

K. Lever's "Greek Comedy on the English Stage" (*CJ*, 42, 169) is a good study on Greek influences in Renaissance England. J. Hutton continues his studies in comparative literature with *The Greek Anthology in France and in the Latin Writers of the Netherlands to the Year 1800* (Cornell Univ. Pr., 1946). Part I of H. Baker's *The Dignity of Man* (Harvard Univ. Pr., 1947) deals with the Hellenic idea of man. Sir A. Zimmern, in "Athens and America" (*CJ*, 43, 3), compares and contrasts the two societies. In the field of fiction based on Greek antiquity should be mentioned G. Baker's *Paris of Troy* (New York, Ziff-Davis, 1947), O. F. Grazebrook's *Nicanor of Athens* (Macmillan, 1947), and L. Marcuse's *Plato and Dionysius* translated by J. Ames (Knopf, 1947).

SEMITIC LANGUAGES AND LITERATURES*

By G. Douglas Young
Faith Theological Seminary

GENERAL

In this field, one of the most noticeable results of the cessation of the war is the great increase in the publication of books. Comparing 1947 to 1946, in view of the continued importance of the Near East in world affairs, the increase of material dealing with this section of the world is of note. The American Year Book for 1946 referred to an address by Dr. E. A. Speiser in which he pointed out the importance of the Near East as one of the keys to world power. A full discussion of this subject has been published by Dr. Speiser in his *The United States and the Near East* (Harvard University Press), presenting in detail the background and present situation.

Of general interest to Semitists are a number of books and articles. Edward J. Jurgi has edited a book, a symposium, *The Great Religions of the Modern World* (Princeton University Press). The symposium includes articles on Judaism and Islam. A similar work is Gerald R. Berry's *Religions of the World* (Barnes and Noble), in which are given a view of these religions from primitive times to the present. Students of Semitic art will be interested in Kirk Weitzmann's *Illustrations in Roll and Codex* (Princeton University Press), a study of the origin and method of text illustration. Two further items of general interest are found in *BASOR*. The first is a typographical index to the *Bulletin*, Numbers 71 to 100, found in the February issue. The second is a number of important comments by W. F. Albright on numerous publications received by the *Bulletin*, to be found in the issues of February and April.

ARCHAEOLOGY

K. L. Kelso and J. Polin Thorley have combined to give us "A Ceramic Analysis of Late-Mycenaean and Other Late-Bronze Vases from Jett in Palestine." Nelson Glueck describes "Some Chalcolithic Sites in Northern Gilead." This article is accompanied with plates of the sherds. In a short note, W. F. Albright discusses the name of "The Late Bronze Town at Modern Djett." He identifies it with the Amarna Gitipadalla. These are found in *BASOR* for December, 1946. Yigael Sukenik, in the *Bulletin* for April, writes, "On the Technique of Khirbet Kerak Ware."

Semitists interested in human origins will welcome the article, "Asiatic Prehistory and the Origin of Man," by Robert J. Braidwood in *JNES* for January. This is a review article of four books: *Early Man and Pleistocene Stratigraphy in Southern and Eastern Asia,* by H. L. Movius, Jr.; *Research on Early Man in Burma,* by Hellmut De Terra and H. L. Movius, Jr.; *Giant Early Man from Java and South China* and *The Skull of Sinanthrapus Pekinensis,* by Franz Weidenreich.

---

* ABBREVIATIONS. *JAOS, Journal of the American Oriental Society; JBL, Journal of Biblical Literature; JCS, Journal of Cuneiform Studies; JNES, Journal of Near Eastern Studies; JQR, Jewish Quarterly Review; BA, Biblical Archaeologist; and BASOR, Bulletin of the American Schools of Oriental Research.*

Three articles have been published on ancient coins. The first two are by E. L. Sukenik, and were published in *JQR* for January and October, bearing the titles, "Horde of Coins of John Hyrcanus," and "Some Unpublished Coins of Aelia Capitolina." Of these, the former is a description of 63 coins said to have been found in Beth-Sahur, near Bethlehem, bearing the inscription of Jehohanan, the High Priest; while the latter describes coins struck by members of the family of the emperor Traianus Decius. The third article is a contribution of Sir Alexander S. Kirkbride, "Some Rare Coins from Transjordan," with plates, published in *BASOR* for April.

Leroy Waterman in *JNES* for July, discusses, "The Treasuries of Solomon's Private Chapel." The same publication for July carries an article by A. Leo Oppenheim, "Fiscal Practice of the Ancient Near East." It is maintained that temple administrative technique migrated from Babylon to Persia and from there to Jerusalem. Of interest in the field of art are two books by Miss E. Porada, *Mesopotamian Art in Cylinder Seals of the Pierpoint Morgan Library* (Pierpont Morgan Library), and, *Seal Impressions of Nuzi* (The Annual of the American Schools of Oriental Research); and *Five Thousand Years of Gems and Jewelry,* Revised Edition, by Frances Rogers and Alice Beard (Lippincott). An illustration of cultural borrowing is shown in the art of the period by Miss Helene J. Kantor in "The Shoulder Ornament of Near Eastern Lions," found in *JNES* for October. Isaiah Sonne discusses "The Paintings of the Dura Synagogue," in the *Hebrew Union College Annual* (Vol. XX). In the same volume, F. Landsberger presents his "The Origin of the Winged Angel in Jewish Art."

CUNEIFORM STUDIES

One of the most notable contributions in this field is the appearance of a new periodical, *The Journal of Cuneiform Studies,* edited by Dr. A. Goetze. In the first number of this new periodical is an article by the editor, "The Akkadian Passive." An important book is also to be noted from the pen of Dr. Goetze entitled, *Old Babylonian Omen Texts* (Yale University Press). In the second number of *JCS,* A. Leo Oppenheim discussed "Deictic -ka, -kunu in Neo-Babylonian." Charles -F. Jean gives, in the second number of *JCS,* in transliteration and translation, eight letters from Mari, under the title "Lettres de Mari." G. R. Driver, in *JCS* (Number 1), discusses "Additions to the Cuneiform Syllabary." George E. Mendenhall gives corroboration for a reading BIR_5 in the Amarna Letters in an article, "The Message of Abdi-Ashirta to the Warriors," published in *JNES* for April. Further important chronological data is furnished by O. Neugebauer in "A Table of Solstices from Uruq," in *JCS* (Number 2). In Volume I of *JCS,* his collaborator on a recent book, A. Sachs, discusses "Two Neo-Babylonian Metrological Tables from Nippur." Homer H. Dubs gives a supplement to Neugebauer's Lunar Canon in *JNES* for April, "A Canon of Visible Penumbral Lunar Eclipses for the Near East and Egypt from 1400 to 1000."

JCS (Number 2) also contains an article by Nikolaus Schneider, "Der Sangu als Verwaltungsbehorde und Opfergabenspender im Reiche der Dritten Dynastie von Ur." Samuel N. Kramer reports on work done at Istanbul in *BASOR* for December 1946 and February 1947. In the second, he lists briefly the nature of the 112 Nippur tablets, inscribed with Sumerian epics and myths, copied on his recent trip to Istanbul. The same author discusses "Gilgamesh and the Land of the Living" in *JCS* (Number 1). A new treatment of this famous epic is A. Heidel's *Gilgamesh and Old Testament Parallels* (University of Chicago Press), a translation with notes. S. R. Kraus of Istanbul in *JCS* (Number 2), discusses "Die Istanbuler Tontafelsammlung," and gives two plates. *JCS* (Number 1) also contains René Labat's "Note sur la conjugaison élamite."

Three articles on Hittite Studies are included in *JCS*. In Number 1, H. Pedersen discusses, "Hittite dalagnula and barganula." In Number 2, Sedat Alp discusses, "La désignation de Lituus en hittite." While Dr. A. Goetze takes a different position in his, "The Priestly Dress of the Hittite Kings," in the same issue.

R. G. Kent continues his Persian studies in *JAOS* for January, "On Some Old Persian Inscriptions of Darius I." Those interested in background material will welcome the book of Ernst Herzfeld, *Zoroaster and His World* (Princeton University Press).

EGYPTIAN

H. E. Winlock has written, *The Rise and Fall of the Middle Kingdom in Thebes* (Macmillan). Emil Ludwig's *The Nile, The Life Story of a River*, translated into English by Mary H. Lindsay, was republished in a deluxe edition (Garden City Publishing Co.). In *JNES* for July, William F. Edgerton presents "The Government and the Governed in the Egyptian Empire." He describes it as an autocratic bureaucracy, highly centralized in principle and to a great extent centralized in practice. The same author, in the October number of *JNES*, discusses "The Nauri Decree of Seti I: A Translation and Analysis of the Legal Portion." He concludes that this decree did not weaken the autocratic government but rather regulated the practices of the officers.

Valuable information on Egyptian philology and texts appeared during 1947. In *JNES* for January, William F. Edgerton discusses "Stress, Vowel Quantity, and Syllable Division in Egyptian." A. S. Yahuda, in the March *JBL*, lists and discusses, "Hebrew Words of Egyptian Origin." Keith C. Seele gives a description of two "Cippi of Horace" amulets with translation of the text, under the title "Horace on the Crocodiles" in *JNES* for January. In the same publication for July, Miriam Lichtheim discusses "Situla Number 11395 and Some Remarks on Egyptian Situlae." Kurt Pfluger, in *JAOS* of April, discusses "The Private Funerary Stelae of the Middle Kingdom and Their Importance for the Study of Ancient Egyptian History."

JNES for April carries Marie-Louise Buhl's "The Goddess of the Egyptian Tree Cult," containing a list of the Egyptian names with their Greek counterpart, as well as a similar list of the sacred groves. To the study of Egyptian Art, Georg Steindorff has added *Catalogue of the Egyptian Sculptures in the Walters Art Gallery, Baltimore* (Walters Art Gallery). "The Artist of the Egyptian Old Kingdom," being a review article of W. S. Smith's *A History of Egyptian Sculpture and Painting in the Old Kingdom* (Oxford University Press), is presented by John A. Wilson in *JNES* for October. James Henry Breasted, Jr., who gave us a bibliography of Steindorff in *JAOS* (Vol. 66, Number 1) gives "Steindorff's Bibliography: Additions," in *JAOS* for April. Jean Sainte Fare Garnot and Claire Lalouette collaborate to give "Bibliographie des egyptologues français, 1940-1946" in *JAOS* for April.

CANAANITE

"The Phoenician Inscriptions of the Tenth Century, B. C. from Byblus" by W. F. Albright, in *JAOS* for July, shows the import of these inscriptions on the question of Ugaritic-Phoenician relationships and on the orthography of Hebrew. In the same issue of *JAOS* Julian Obermann gives, with text and translation, a discussion of "How Baal Destroyed a Rival." Another Ugaritic text is treated by H. Neil Richardson in *JBL* for September, "A Ugaritic Letter of a King to His Mother." This is the letter originally published in Syria (Number 21, 1940). Other

Ugaritic material is found in two reviews of H. L. Ginsburg's, *The Legend of King Keret* (American Schools of Oriental Research). The first is by T. H. Gaster, in *JQR* for January, and the second by C. H. Gordon in *BASOR* for February.

SOUTH SEMITIC

Of interest to many will be the republication of the second edition of R. A. Nicholson's *Elementary Arabic; Second Reading Book; Third Edition* (Macmillan), and Carl Brockelmann's *History of the Islamic Peoples* (Putnam), translated from the German by Joel Carmichael and Moshe Perlmann. There is included a review of events 1939 to 1947 by Perlmann. Three other books of a more general character are A. R. Nykl's *Hispano-Arabic Poetry and Its Relation with the Old Provençal Troubadours* (Hispanic Society), M. S. Diamond's, *A Handbook of Mohammedan Art* (Hartsdale House, N. Y., second edition revised and enlarged), and M. J. Steiner's *Inside Pan-Arabia* (Chicago University Press), which gives a review of political and economic factors of the past and present. *JQR* for July gives a contribution from the pen of H. A. Wolfson, "Arabic and Hebrew Terms for Matter and Elements, with Special Reference to Saadia."

HEBREW AND ARAMAIC

Of interest to students of Hebrew will be the new impression of the second English edition of F. H. W. Gesenius' *Hebrew Grammar* (Oxford, Toronto). Two elementary grammars of Hebrew appeared in 1946. *Hebrew Self-Taught* (Zionist Organization), by Z. and B. Scharfstein, and *Modern Hebrew; A First Year Course* (Hebrew Publishing Co., N. Y.) by H. Blumberg and M. H. Lewittes. Hebrew philological matters are treated in a number of articles. In *JBL* for March is found T. H. Gaster's "An Ancient Eulogy of Israel: Deuteronomy 33:3-5 and 26-29." In the same publication for September, J. Reider discusses, "Etymological Studies: YD^c or YR^c and R^{cc}." "Notes on the QAL Infinitive Construct and the Verbal Noun in Biblical Hebrew," by H. M. Orlinsky, is found in *JAOS* for April. "A Hebrew Incantation Against Night Demons from Biblical Times," being a new interpretation, with text of the tablet from Arslan-Tash, by H. Torczyner, is found in *JNES* for January. Nehemiah Allamy of Jerusalem discusses "An Unknown Manuscript of Ben Qoheleth" in *JQR* for October. A lengthy re-examination of the much-discussed subject of Hebrew poetic meter is presented in *JBL* for March by Steven Byington. He concludes that Hebrew has quantitative meter of syllables of three ordinary lengths.

An *Album of Dated Syriac Manuscripts* (Harvard University Press) has been published by W. H. P. Hatch. G. M. Lamsa has published *New Testament Origin* (Ziff-Davis, Chicago). Further evidence on this question of the Aramaic origins of the New Testament is found in *JBL* for March in the article by D. K. Andrews entitled "The Translation of Aramaic *DI* in the Greek Bible." The question under discussion is as to whether translations from Aramaic can be distinguished from documents composed originally in Greek. *Babylonian Talmud in Selection* (Second Edition, Nezikin) has been released. Of general interest will be S. D. Goitein's *From the Land of Sheba; Tales of the Jews of Yemen* (translated into English by Christopher Fremantle, Shocken).

BIBLICAL

An important publication is the book edited by Harold R. Willoughby, entitled *A Study of the Bible Today and Tomorrow* (University of Chicago Press). The individual chapters are by outstanding scholars who give a picture of what the current trends in Biblical research are, and what studies can and should be undertaken in the immediate future. G. Ernest Wright's "Biblical Archaeology Today," in *BA* for February, presents further material on the subject upon which he writes in the book edited by Willoughby. The same publication presents a study of "The Manna of Sinai" by F. S. Bodenheimer of the Hebrew University, Jerusalem. Bodenheimer takes the position that this is a biological phenomenon of the dry desert. The September issue of *BA* gives a study, "The Tabernacle—a Study from an Archaeological and Historical Approach," by Frank M. Cross, Jr. Pan-Babylonianism is revived when the flood story receives two treatments by Emil G. Kraeling. The first is in the July issue of *JAOS* and is entitled "Xisouthros, Deucalion and the Flood Traditions." The second is "The Earliest Hebrew Flood Story" in *JBL* for September. In the latter he discusses the Babylonian patterns found in the J stratum. In the former he appeals to Orientalists and Old Testament scholars on the ground that even late flood stories preserve elements of great antiquity and should be considered. In *JNES* for October, the same author has written on "The Significance and Origin of Genesis 6:1-4." G. L. Feinberg, in his "Parallels to the Psalms in Near Eastern Literature," published in *Bibliotheca Sacra* for July-September, presents another view of the origin of ideas in semitic literature.

The Inter-Testamentary period receives consideration in *JQR* for January when S. Zeitlin, in his article "The Apocrypha," considers the importance of this literature for an understanding of Judaism and early Christianity. The same author in the July issue discusses "The Assumption of Moses and the Revolt of Bar Kokba." The discussion of "Jerusalem 201-199 B. C. E. on the History of a Messianic Movement," commenced in *JQR* (1946) by Eugene Taubler, is continued in the January and October issues of *JQR*. Elias J. Bickerman presents a study of "The Warning Inscriptions of Herod's Temple" in *JQR* for January.

A number of useful tools for Biblical studies were printed or reprinted during the year. Among these is the seventh edition of the *Commentary on the Whole Bible* of Jamieson, Faucette, and Brown (Zondervan). Another is *The Oxford Cyclopedic Concordance* (Oxford). G. E. Wright and F. B. Filson have combined to edit the *Westminster Historical Atlas to the Bible* (Presbyterian Board). Professor Steinmueller, who in 1946 gave us his fifth printing of *Special Introduction to the Old Testament* (Joseph F. Wagner, N. Y.), now gives us his *Companion to the Old Testament* (Wagner, N. Y.).

There are a number of books and articles on miscellaneous themes as follows: Millar Burrows, *An Outline of Biblical Theology* (Westminster Press); J. Phillip Hyatt, *Prophetic Religion* (Abingdon-Cokesbury); J. H. Greenstone, *Jewish Feasts and Fasts* (Bloch); C. A. Simpson, *Revelation and Response in the Old Testament* (Columbia University Press); R. V. G. Tasker, *The Old Testament in the New Testament* (Presbyterian Publications); R. Calkins, *Modern Message of the Minor Prophets* (Harper); B. J. Louis, *Theology of Psalm VIII* (Catholic University of America); G. Matthews, *The Religious Pilgrimage of Israel* (Harper); and *Philo Judaeus* (Harvard University Press), edited by Harry A. Wolfson, in which foundations of religious Philosophy in Judaism, Christianity and Islam are discussed.

Articles are found as follows: W. F. Albright, in *JBL* for December, "The Names Nazareth and Nazarene." In the same periodical for September is Charles C. Torrey's, "The Messiah, Son of Ephraim," being a consideration of the two divine beings to appear on earth at the end of the present age. In *JBL* for September, J. K. Mikliszanski discusses "The Law of Retaliation and the Pentateuch," in which it is pointed out that Hebrew law is based on legal justice, not on the private person's right to retaliate. In *JNES* for April, W. E. Staples writes on "Some Aspects of Sin in the Old Testament," and in the same issue, C. Umhau Wolf gives "Traces of Primitive Democracy in Ancient Israel." In *JBL* for September, Sabatino Moscati discusses "The Wind in Biblical and Phoenician Cosmogony." He suggests that the Hebrews added the contributions of their own originality to the common Semitic tradition and culture. It is in this same issue of *JBL* that Dr. James A. Montgomery considers "A Modern Translation of the Hebrew Bible Compared with the Ancient Versions," being a critical survey of an English version of the Hebrew text of Job in *The Holy Scriptures According to the Massoretic Text; A New Translation* (Jewish Publication Society).

H. A. Fischel considers the theme "Martyr and Prophet" in the January and April issues of *JQR*. In *JQR* for October, 1946, David Daube writes on, "The Last Chapter of Esther," showing the political purpose of Esther. S. Zeitlin in the April 1947 *JQR*, contributes an article on "Prosbol; A Study in Tannaitic Jurisprudence." E. J. Young gives us "The Study of Isaiah Since the Time of Joseph Addison Alexander" in the *Westminster Theological Journal* for November, 1946. In *JNES* for April, "Note on Psalm 109" is written by Harold L. Creager, in which he maintains that verses six to nineteen are curses heaped by adversaries on the writer and not *vice versa,* and quoted by the writer. "The Holy Man in Israel: A Study in the Development of Prophecy" is contributed by Claude Sauerbrei in *JNES* for October. Three articles of interest to the Biblical scholar are found in the *Hebrew Union College Annual* (Vol. XX); "The Chanukkah Festival and the Calendar of Ancient Israel" by J. Morgenstern; "Cushan-Rishathaim" by Eugene Taeubler; "Hebrew Installation Rites" by Raphael Patai.

SLAVIC LANGUAGES AND LITERATURES

By Anthony J. Klancar
Editor and Writer

RUSSIAN LANGUAGE AND METHODOLOGY *

New problems are confronting teachers of Russian. Some solutions may be found in such articles as Agnes Jacques' "Why Students Study Russian" (*MLJ* 31, No. 8, 525-534). The author found that they study the language because of an interest in the economic and political life, the culture, or the social structure of Russia. From John G. Frank's "Hints for Teaching Russian" (*MLJ* 31, No. 1, 21-24), it is clear that "the acquisition of a basic vocabulary is much more important for the learning process of the Russian language than grammar." Harry Josselson's "Russian Word Count" (*MLJ* 31, No. 7, 422-425) tells of the work of the AATSEEL Russian Word Count Committee under the chairmanship of the writer of the article.

RUSSIAN LITERARY HISTORY

Except for the brilliant interlude of the Symbolists and the period after 1910 the history of Russian contemporary literature is the history of Russian fiction. This is clearly indicated in Prof. Janko Lavrin's *An Introduction to the Russian Novel* (Whittlesey House). After a brief survey of seven centuries of Russian fiction, Professor Lavrin devotes the rest of the book to the major 19th century novelists and, in the last chapter, to the development of Soviet fiction. In reviewing this work, Prof. E. J. Simmons has this instructive criticism to offer regarding the pedigree of the Russian realistic novel: "Recent Soviet scholarship in the field (fiction), however, suggests the interesting possibility that Dostoevsky, and not Gogol, was the actual originator of what Belinsky called the 'Naturalistic School' of Russian Fiction."

---

* Abbreviations used for periodicals are: *ARSU—American Review on the Soviet Union, ASEER—American Slavic and East European Review, BA—Books Abroad, BPIASA—Bulletin of the Polish Institute of Arts and Sciences in America, MLJ—Modern Language Journal, PAS—Polish American Studies, PR—Polish Review, PT—Poland of Today, RR—Russian Review.*

Another book, Helen Muchnic's *Introduction to Russian Literature* (Doubleday), is rather a remarkable piece of literary criticism than a literary history. After an all too brief discussion of the folk and early written tradition, the rest of the book is devoted to Pushkin, Gogol, Turgenev, Dostoevsky, Leo Tolstoy, and Chekhov. To Professor Muchnic, Russian literature is a "voice of men, and not of systems." Read side by side with George Reavey's *Soviet Literature Today* (Yale Univ. Press), one realizes what a grisly role writers have to play in a totalitarian state. Covering Soviet literature after 1941, Reavey's book makes an excellent supplement to Gleb Struve's recent *Twenty-Five Years of Soviet Russian Literature*. For a short, concise treatment of the Russian language (378-830), literature (384-408), drama, and the theatre (409-421) see Ernest J. Simmons' *USSR: A Concise Handbook* (Cornell Univ. Press).

"Soviet Russian Literature in 1946" (*SPT* 2, No. 8, 24-29) reveals a search for new themes, the best work of the year being Panov's *Sputniki* which "paints a majestic portrait of the common Soviet Man in the accomplishment of his historic exploit." Other themes are the veteran's return home, family life, youth in revolt (P. Zamoisky's *Molodost*), and idealized pictures of the past. A Soviet critic's appraisal of the literary accomplishments during the 29 years of the existence of the Soviet State, with special emphasis on the literature written during the war, may be found in Konstantine Simonov's "Literature of the Soviet People" (*SRT* 15, No. 12, 8-9, 22-23). Joshua Kunitz's "Soviet Literature—a Mirror of Soviet Life" (*SRT* 16, No. 7, 28-30, 40) has the additional value of giving the theory behind Soviet literature, its socialist realism and the consequent ruthless realism in depicting the vicissitudes of Soviet existence.

RUSSIAN LITERARY CRITICISM

Soviet writers continue to occupy literary critics. Probably the most interesting of this crop of writings is Eugene Almazov's "On the 'Tendentious' in Literature" (*Mainst ream* 1, No. 2, 199-211), a defense by a Soviet critic. According to Almazov "Soviet writers are tendentious in the sense that they express the tendencies that exist and have emerged victorious in Soviet life. To the Soviet reader, this constitutes a merit, no matter how it may be frowned upon by certain critics." Vera Sandomirsky in her article on "Leonid Leonov and the Party Line" (*RR* 6, No. 2, 67-76) is one critic who frowns upon such work. One of the really good writers in Russia today, Leonov has so far refused to toe the Party Line. His best work deals with "marginal" people outside the pale of the new Soviet society.

Leonid I. Strakhovsky's subject "Anna Akhmatova—Poetess of Tragic Love" (*ASEER* 6, Nos. 16-17, 1-18) lends itself to fine writing, for Akhmatova's poetry is personal and autobiographical, sentimental in a simple human way; her main theme is love. She is, indeed, "the last flower of the noble Russian Culture, the guardian of poetical piety," as the critic Aikhenvald once said of her. A chapter in a forthcoming book on *The Acmeist Poets of Russia,* Professor Strakhovsky's "Osip Mandelstam—the Architect of Words" (*RR* 7, No. 1, 61-70) gives promise of an absorbing study of Gumilev's Guild of Poets. Gumilev himself has said of Mandelstam: "He has used to perfection the knowledge that not a single image has an independent meaning and is needed only for the purpose of revealing the poet's soul as fully as possible." A wonderful sonority, form, and eloquence are Mandelstam's main characteristics.

In writing about "Nikolai Nekrasov, Poet of the Russian People" (*BA* 21, No. 4, 393-395), Boris Kader reminds us of the greatness of this people's poet who was and is the personification of civic poetry, based on the forms of the Russian folk song. Alexei Tolstoy, famous for his historical ballads, was a contemporary of Nekrasov. Jules Bernard's "Notes on Alexei Tolstoy's *Harold Svenholm*" (*ASEER* 6, Nos. 16-17, 79-91) offers proof that the poem is not a translation of an English ballad as once supposed, but an original Russian poem.

Worth noting is Waclaw Lednicki's "Tolstoy Through American Eyes" (*Slavonic Review* 25, No. 65, 455-477), a criticism of Ernest J. Simmons' *Leo Tolstoy*. Professor Lednicki writes that Simmons has succeeded in "securing to him the most recent knowledge of many events in the life of Tolstoy, of problems connected with his art and philosophy, and of interpretations of the works of the great Russian writer."

Illuminating a little known side of Rilke's poetry, Samson Soloveitchik and E. E. Gladding deal in "Rilke's Original Russian Poems" (*Modern Language Notes* LXII, No. 8, 514-522) with eight Russian poems written by the great German poet. The comments on Rilke's knowledge of Russian should prove interesting to the student of Russian verse.

RUSSIAN BIOGRAPHY

Practically a reprint of the author's previous *A Great Russian Realist* (1913), *Fyodor Dostoevsky* (Scribner) tries to explain the charges leveled at Dostoevsky and stresses that his own life was very like the lives of the people in his novels. A straight biography, there is little literary criticism in the book. As a critical interpretation of the great Russian realist's novels, Janko Lavrin's *Dostoevsky* (Macmillan) should be read together with biographies by Carr, Simmons, etc. According to Professor Lavrin, Dostoevsky set up Freud and the modern psychological novelists in business.

RUSSIAN FICTION

Two anthologies of Russian literature in English translation which deserve the heartiest reception appeared this year. Avrahm Yarmolinsky's *The Portable Chekhov* (Viking) offers the best of Chekhov as represented by 28 short stories in his best moods and method. The anthology includes *The Cherry Orchard, The Boor,* and a selection of letters. It would be advisable to read Kornei Chukovski's "Friend Chekhov" (*Atlantic Monthly* 180, No. 3, 84-90), a delightful pen portrait of Chekhov whose main theme in all his work was "the crying senselessness and fruitlessness of the sufferings to which one group of people, for some reason or other, subjects others."

B. G. Guerney's *Portable Russian Reader* (Viking) is almost entirely devoted to short fiction with about one-third belonging to the time since the Revolution of 1917. Yarmolinsky's *Treasury of Great Short Stories: Pushkin to Gorky* was reissued by Macmillan in 1947.

RUSSIAN DRAMA

Russian drama is comparatively poor by the side of the novel. Yet the plays of Griboedov, Pushkin, Gogol, Ostrovski, who was Russia's first professional dramatist, Tolstoy, Chekhov, Gorky, and Andreyev have found a place in anthologies of world drama. The first important new play of the Soviet regime was Mayakovski's *The Mystery Bouffe*. Realistic drama of the struggle with the changing tempo of Soviet life has given way to plays striving toward a fuller comprehension of the individual's problems in a collectivist society. See H. W. L. Dana's "Russian Drama" (*Clark-Freedley*, 370-481).

The Soviet stand on "The Drama, the Theatre and Life" (*SPT* 2, No. 1, 11-16) is given by Konstantine Simonov who insists that the dramatist must know life and the demands of the people, must portray the Soviet man as a man building a socialist society and professing the ideals of communism. A dramatic performance is an artistic as well as a political phenomenon, and the portrayal of a hero in a Soviet play is a political question for the actor. Whether Simonov achieves these objectives may be seen from his play *The Whole World Over* (Dramatists Play Service), which was produced on Broadway in 1947. See review of this play in *Catholic World* (165, 168-169, My).

The current theatre in the USSR is discussed in David Tutaév's "In Search of an Everyman" (*Theatre Arts* 31, 35-37, Ag). Actors and audience are brought together in several war plays with the sole idea of "informing men in the best reason for living." What has been the taste of the Soviet theatregoer is shown statistically in "Analysis of Soviet Theaters and their Repertoires as of 1941" (*ARSU* 8, Nos. 3-4, 82-85). In Sergei Bertensson's excellent article on "The Premiere of 'The Inspector General'" (*RR* 7, No. 1, 80-95) we get a vivid picture of opening night of one of the world's greatest plays.

A chapter in Prof. Mikhail M. Morozov's book of the same name, "Shakespeare in the Soviet Union" (*ARSU* 8, No. 2, 3-15) surveys briefly research aid for theatres, character interpretation, annual Shakespeare conferences, university study of the Bard, and problems of Shakespearean scholarship. "Our study of Shakespeare is in many ways based on the experience of the theatre. On the other hand, our theatres which produce Shakespeare usually seek the help of the Shakespearean scholars."

POLISH LITERARY CRITICISM

Studies by two young American critics are an encouraging sign for Polish Studies. Victor Erlich's "Beniowski and *Don Juan*" (*Symposium* 1, No. 2, 87-98) has written more "an attempt at a literary parallel." Juljusz Slowacki, one of Poland's greatest Romantic poets, wrote a Byronic satire, *Beniowski*, which in many ways surpasses the English model. Albina I. Kruszewska and Marion M. Coleman's "The Wanda Theme in Polish Literature" (*ASEER* 6, Nos. 16-17, 19-35) is a brief survey of the rise and development of the Wanda theme with a few of its many applications in literature. Wanda, the ideal Polish maiden, is a combination of Elaine, Cordelia, and Boadicea.

The Polish critic, Richard Matuszewski, clearly states the trend of "Polish Literature and the War" (*PT* 2, No. 3, 10-11) and "Polish Post-War Prose" (*PT* 2, No. 12, 3-4) toward realism, expressed in the diaries and documentary prose fiction with their topics taken from war experiences at home and abroad. This movement back to realism has found its chief expression in Tadeusz Breza's prize-winning novel *The Wall of Jericho*, the tales of Jerzy Andrzejewski, and the novels of Ksawery Pruszynski. Polish prose "still presents a wide range of trends and styles, but the elements of psychology and of the grotesque are much more closely related to real life." Prof. Waclaw Lednicki's "Behind the Curtain of Indifference: Recent Polish Literature" (*Journal of Central European Affairs* 7, No. 1, 74-80) reviews five books, published in New York and Poland in 1946, with a range of subjects from general discussion of Polish literature, an anthology, the biography of a city to poetry before, during, and after the war.

MICKIEWICZ AND SIENKIEWICZ

Literature on Poland's best known literary figures increases in volume yearly. Leopold Wellisz's "The Friendship of Margaret Fuller D'Ossoli and Adam Mickiewicz" (*BPIASA* 4, 83-122) gives us a vivid picture of the famous friendship, using their correspondence of 1847-1849, written in France and Italy, as the basis of his discussion. The musical uses of Mickiewicz's poems have been many since 1827, we learn from Arthur and Marion Coleman's *Mickiewicz in Music* (Klub Polski, Columbia). Of special interest is a new composition by Henryk Nagorka, a young Polish-American composer. There is also an essay on the composers who wrote the music to Mickiewicz's lyrics.

Other sidelights on Mickiewicz may be found in the same authors' "Polonica and Connecticut" (*PAS* 4, Nos. 1-2, 6-15) and Adam Mickiewicz's little known short story "Zevila" (*PR* 7, No. 1, 8-9).

Paderewski's "Eulogy on Sienkiewicz" (*PR* 7, No. 1, 6), delivered upon occasion when the Polish novelist's ashes were returned from Vevey, Switzerland in 1924, is an important literary appraisal. A photograph of "The Elderly Gentleman with the Rose" (*BPIASA* 4, 79-82) is used by Jan Lechon to symbolize what was most important in Sienkiewicz who "believed that beauty is the supreme good, that art is a consolation and escape." Consequently, his novels have many appeals. Anthony J. Klancar's "Folklore in Sienkiewicz's Famous Trilogy" (*PR* 7, No. 8, 8-9) deals with what appeals to a folklorist. Jeremiah Curtin, the "discoverer" of Sienkiewicz in America, forms the central subject of Marion M. Coleman's "Sienkiewiczana at Columbia University" (*PR* 7, No. 3, pp. 4, 12).

POLISH DRAMA

The first considerable dramatists of the modern period were, according to M. M. Coleman's "Polish Drama" (*Clark-Freedley,* 493-502), Stanislaw Przybyszewski and Gabryela Zapolska, exponents of "art for art's sake" and naturalism; but the genius of the period was Stanislaw Wyspianski whose *The Wedding* deserves a high place among the world's greatest dramas. The main dramatist of Free Poland (1920-1930) was Jerzy Szaniawski. In the period before the invasion of Poland, the trend away from realism set in and there followed a period of dramatic doldrums. Richard Matuszewski's "The Theatre in Post-War Poland" (*PT* 2, No. 6, 10-13) brings us up to date about the work of Ludvik Solski, Stefan Jaracz, and Leon Schiller, all great names in the Polish theatre.

Each year Slav-American theatre groups put on plays by their favorite old country playwrights. The most active of these groups are the Polish communities in Chicago and New York. Matthew J. Strumski's "The Beginnings of the Polish American Theatre" (*PAS* 4, Nos. 1-2, 31-36) brings together for the first time facts of considerable interest to the student of the immigrant theatre in America.

POLISH LANGUAGE AND LITERATURE

A much-needed teaching aid is supplied by Sister M. Edwina's "A Polish Standardized Test" (*PAS* 4, No. 1-2, 19-30), consisting of reading, vocabulary, and grammar tests. The 4,825 teachers engaged in Polish instruction will find this test a time-saver. Also useful is Joseph F. J. Baluta's *Practical Handbook of the Polish Language* (Pol. Bk. Imptg. Co.).

Lucia Merecka's collection of *Polish Folk-Tales* (Sheed & Ward) consists of the favorite stories of Polish children, adapted to American taste. It is a good addition to the small body of Slavic folk-tales published in recent years.

CZECH LITERATURE

If Leo Lania's "Europe's Battered Muse" (*Sat. Rev. Lit.* 30, 10-11, Ap 19) is read in conjunction with F. C. Weiskopf's "Literature in Czechoslovakia" (*UN World* 1, No. 7, 56-57), one gets a good idea of Czech literature before, during, and after the war. Translations, native non-fiction, and reports on the war are the most popular. In poetry, recent volumes by Seifert, Halas, and Holan are the pride of Czech letters.

Beginning with a short account of the Czechoslovak theatre during the war, "Return to Action" (*Theatre Arts* 31, No. 8, 18-25) by Alan Schneider and Frantisek Vrba resolves itself into a discussion of the past theatrical season in Prague, its revived theatres, plays native and foreign—"a theatre and drama in which reality of human life is the most miraculous and precious thing in the world." The older "Czech (Bohemian) Drama" (*Clark-Freedley,* 504-512) is examined by M. M. Coleman. One of the greatest phenomena in modern Czech dramatic literature is Jaroslav Hilbert. Newer dramatists are Fr. Langer, K. Capek, Rudolf Medek, Frana Sramek, etc.

Pavel Eisner argues in his absorbing article on "Franz Kafka and Prague" (*BA* 21, No. 3, 264-270) that, though Kafka wrote in German, his spirit is Slavic and belongs to Czech Prague. "It is absolutely clear to me that Kafka's work could originate only in Prague and nowhere else."

INDO-EUROPEAN LINGUISTICS *

By George S. Lane
Professor, University of North Carolina

THE LINGUISTIC INSTITUTE

With the 1947 session at Ann Arbor, it may be said that the Institute was once again on a pre-war basis. The expectation of sufficient enrollment of advanced graduate and post-doctoral students warranted the inclusion of such courses as Italic Dialects, Pāli, and Tocharian in the Indo-European field, but the trends of language study during the war were not ignored. Considerable emphasis was again placed on the descriptive method and on problems of language teaching which had grown out of the Intensive Language Program and the language instruction in the Area and Language classes of the Army Specialized Training Program (cf. The American Year Book, 1943, p. 900 f., 1944, p. 928 f.). The courses in the Institute were augmented by weekly luncheon conferences and a series of weekly evening lectures, for which scholars not on the regular staff were brought to Ann Arbor. The general aim of these lectures and discussions was to center attention on the relations between descriptive and comparative linguistics and upon controversies in methodologies in linguistic science (cf. The American Year Book, 1946, p. 942 f.).

GENERAL CONTRIBUTIONS

The year saw the publication of *An Introduction to Linguistic Science* by E. H. Sturtevant, professor emeritus of Linguistics in Yale University (Yale University Press, 1947). The effort at production of an elementary introduction to the science "for readers with no previous knowledge of linguistics" is a welcome one. Attention has already been called (The American Year Book, 1946, p. 943 f.) to the major task before the linguist: the promotion of the knowledge of his science beyond the immediate circle of specialists. Sturtevant's book, while not designed for popular entertainment, is a long step forward in the direction of a competent elementary textbook for beginning college classes in linguistics.

Problems of Indo-European comparative grammar are treated by G. M. Messing, "Selected Studies in Indo-European Phonology" (*Harvard Stud. Class. Phil.* LVI-LVII, 163-232), chiefly a criticism of various features of the laryngeal hypothesis (see The American Year Book 1942, p. 902). Likewise the Columbia Dissertation of Benjamin Schwartz, "The Root and its Modifications in Primitive Indo-European" (*Language Diss.* No. 40, Baltimore, 1947), is based upon the same hypothesis and the assumption of Indo-Hittite, according to Sturtevant. Less controversial are the articles by F. Mezger, "Some Indo-European Formatives" (*Word* 2. 229-240), T. H. Maurer, "Unity of the Indo-European Ablant System: The Dissyllabic Roots"

---

* Abbreviations: *MLN—Modern Language Notes; JAOS—Journal of American Oriental Society; AJP—American Journal of Philology; Gmc. Rev.—Germanic Review; PMLA—Publications of the Modern Language Association; Lang.—Language; Class. Phil.—Classical Philology; JEGPh.—Journal of English and German Philology; TAPA—Transactions of the American Philological Association.*

(*Language* 23, 1-22); and Ernst Pulgram, "Indo-European Personal Names" (*ibid.* 189-206). The author of the latter article argues that the simple appellative, familiar from Latin, was the oldest type, not the dithematic type of name generally assumed on the basis of Indic, Greek, and Germanic.

In view of the quarrel over methodology already mentioned (above, with reference), R. A. Hall, Jr., has given us a welcome exposé of the theories of the Italian school of areal linguists in "Bartholi's Neolinguistica," (*Language* 22. 273-283).

That the journal of the "Cercle linguistique de New York," *Word* has become, as it were, more and more the organ of expression of those scholars who lean toward the "mentalistic" approach to language studies, might be deduced from two recent articles: Margaret Schlauch, "Early Behaviorist Psychology and Contemporary Linguistics" (*Word* 2. 25-36), and A. Nehring, "The Functional Structure of Speech" (*ibid.* 195-209).

Two theoretical contributions to the descriptive method are made by E. A. Nida. The one is a textbook or "practice manual" for beginners *Morphology: The Descriptive Analysis of Words* (Univ. of Michigan Publ. in "Linguistics," vol. II), the other "Field Techniques in Descriptive Linguistics" (*IJAL* 13. 138-146). Special articles illustrating the method are those by R. S. Wells, "Immediate Constituents" (*Language* 23. 81-117) and W. G. Moulton, "Juncture in Modern Standard German" (*ibid.* 212-226). Mention must be made also of K. L. Pike's monograph, *Intonation in American English* (Ann Arbor, 1946). Of general interest also is the continuation of W. F. Leopold's observations *Speech Development of a Bilingual Child* (vol. 2): *Sound-learning in the First Two Years* (Northwestern Univ. Studies in the Hum. 11, Evanston, 1947).

Yet one more title should be mentioned here, that of the report of a special commission appointed by the American Council on Education: R. J. Matthew, *Language and Area Studies in the Armed Services, Their Future Significance* (Washington, 1947, cf. above with references).

INDO-IRANIAN

P. Tedesco has continued his painstaking studies in the field of Sanskrit lexicography and etymology by contributions on "Sanskrit *mala-* 'Wreath'" (*JAOS* 67. 85-106), "Sanskrit *pudgala-* 'body'" (*ibid.* 172-177), and Sanskrit *adaḥ* 'illud'" (*Language* 23, 118-124). R. G. Kent, in spite of illness, continues his Old Persian studies with "On Some Old Persian Inscriptions of Darius I" (*JAOS* 67. 30-33) and L. H. Gray, in "A Suggested Restoration of the Hao o t Nask" (*ibid.* 14-23), attempts to reconstruct the original Avestan text by transcribing it into a more nearly original alphabet and transcribing this in turn into Latin letters.

TOCHARIAN

G. S. Lane has contributed the first translation of a longer text in "The Tocharian Puṇyavantajātaka: Text and Translation" (*JAOS* 67. 33-53).

CLASSICS

The dean of Homeric scholars, G. M. Bolling, continues his studies with two contributions: "The Personal Pronouns of the Iliad" (*Language* 22. 341-3) and "Personal Pronouns in Reflexive Situations in the Iliad" (*ibid.* 23. 23-33). G. M. Messing has contributed another interpretation of a troublesome word in "The Etymology of Greek ὁ, ἡ, τὸ δεῖνα" (*Language* 23. 207-211), and Miss E. A. Hahn again shows her preference for syntactic studies by the discussion "Are the Homeric Subjunctive and Optative Future Tenses?" (*TAPA* LXXVII 318-19). A significant, if slight, contribution to etruscology is made by H. M. Hoenigswald in his study "The Phonology of Etrusco-Roman Names" (*ibid.* 319).

GERMANIC

In the field of etymology, we may cite two studies by F. Mezger, one "Gothic *managei*" (*Language* 22. 348-53), the other "Gothic *aglaiti* 'unchastity', OE *aglæc* 'distress' (*Word* 2. 68-71), and two by R. A. Fowkes "Crimean Gothic *cadariou* 'miles, soldier'" (*JEGPh.* XLV, 448-9), and "Two Germanic Etymologies" (*Language* 22. 347-8). A. M. Sturtevant continues his gleanings in Gothic and Norse with three contributions "Gothic Morphological Notes" (*JEGPh.* XLVI, 92-97), "Notes on Old Norse Phonology" (*Scand. Studies* 19, 208-216), and "Some Irregular Forms in Old Norse" (*MLN* LXII, 255-58). In an article entitled "Prehistoric 'Cultural Strata' in the Evolution of Germanic: The Case of Gothic" (*MLN* LXII, 522-539), G. K. Zipf attempts to apply statistical methods to the solution of the problem involved. H. Penzl attacks two phonological problems, one, "The Development of Germanic *ai* and *au* in Old High German" (*Gmc. Rev.* XXII, 174 ff.), concerning the question of basing conclusions regarding phonetic changes on orthographic fluctuations, the other, "The Phonemic Split of Germanic *k* in Old English" (*JEGPh.* 23. 34-42). L. M. Hollander, in "Middle High German *sch*" (*JEGPh.* LXVI, 82-91), reviews the chronology of the change OHG [sk] Germ. [š].

CELTIC

For British, R. A. Fowkes presents two etymological studies: "Some Brythonic Cognates of English sward" (*Language* 22. 435-6) and "Welsh Etymologies" (*Word* 2. 48-49). Other studies are those by V. Hull, "Archaic Irish *inda*" (*Language* 22. 343-45) and by N. M. Holmes, "Postvocalic *s* in Insular Celtic" (*ibid.* 23. 125-136).

DIVISION XXVI

THE ARTS

ARCHAEOLOGY

By Jotham Johnson
Associate Professor, New York University

GENERAL

What with difficulties of food, fuel, transportation, manpower, and currency in most foreign countries, and a not completely stable political situation in Europe and Asia, archaeology had not entirely regained its post-war feet at the end of 1947. Most archaeologists had resumed their peacetime positions, though a few remained in government service, as Charles R. Morey of Princeton University who continues as Cultural Attaché of the American Embassy in Rome, and several are reported as having returned to military service, as Jerome Sperling of Yale University. Field work was almost at normal in the Americas, but only six or seven American expeditions to the Eastern Hemisphere have been reported, England has virtually withdrawn from overseas work, and the only country widely engaged in active field work abroad is France.

ARCHAEOLOGICAL INSTITUTE ACTIVITIES

The President of the Archaeological Institute of America is again Sterling Dow of Harvard University, and the General Secretary is Stephen B. Luce of the Rhode Island School of Design. The editor of the Institute's official technical quarterly, the *American Journal of Archaeology,* is again John Franklin Daniel of the University of Pennsylvania Museum. Because of editorial and printing difficulties, this journal had fallen some months behind schedule; Dr. Daniel, by publishing six issues in a few months, has restored it to its regular schedule. The Institute has entered on two new publishing adventures: the *Archaeological Newsletter,* of which two issues appeared in 1946 and five in 1947, and a non-technical quarterly, *Archaeology,* edited by Jotham Johnson, of which the first issue was scheduled for publication Dec. 31, 1947. Four local societies—Lehigh Valley, Lynchburg, Washington, and western Massachusetts—were organized or reestablished during 1947. The annual meeting of the Institute was held at Yale University, Dec. 29-31.

AMERICAN SCHOOL OF CLASSICAL STUDIES AT ATHENS

The titular director of the Athens School is Rhys Carpenter of Bryn Mawr College, but he has not taken up residence, and Oscar Broneer is acting director. Shirley Weber continues as librarian of the Gennadeion Library, administered by the school. No summer session was held in 1947, but, as of Oct. 1, the school was on as nearly normal a footing as conditions permitted with full staff and eight students in residence. A summer session, to be directed by Louis E. Lord, is being planned for 1948. Members of the school staff have inaugurated a series of open lectures on the history and monuments of Athens; these have attracted audiences of 130 or more.

The school's excavations in the Athenian Agora, directed by Homer A. Thompson, now of the Institute for Advanced Study, Princeton, were active in 1947; the excavations, though devoted primarily to cleaning to bedrock areas previously dug, and to exploring the site of the future museum, yielded several discoveries of consequence, including a Mycenaean chamber tomb of the fourteenth century B.C., with undisturbed burials, other tombs and graves, several important sculptures, and numerous inscriptions, vases and vase fragments, figurines, ostraca, and coins. Plans for the Agora Museum have been drawn and it is hoped that construction can begin in 1948. The Corinth excavations have been limited to routine cleaning and maintenance, but substantial progress has been made in the preparation of the official publications of the site.

Carl W. Blegen of the University of Cincinnati was in the Aegean during the summer, to review his earlier excavations at the site of Troy for the definitive publication, and to plan on the early resumption of his work at Pylos ("Nestor's Palace"), where his few weeks of exploration in 1939 yielded 600 clay tablets in an Aegean syllabary. Karl Lehmann of New York University visited his pre-war excavations on Samothrace, and reported lamentable damage to the excavated area by Bulgarian troops.

SCHOOL OF CLASSICAL STUDIES OF THE AMERICAN ACADEMY IN ROME

The summer sessions of the Rome School were resumed in 1947, again under the direction of Henry Thompson Rowell of the Johns Hopkins University; 19 students attended, and plans are laid for the 1948 summer session. The director of the Academy, Laurance Page Roberts, is in residence, and Frank E. Brown assumed the duties of professor in charge of the School of Classical Studies during the summer. With the opening of the winter session Oct. 1, the school was back in approximately normal operation.

THE JERUSALEM SCHOOL

The Jerusalem School is in as nearly normal operation as the disorderly political conditions permit; no actual digging has been attempted, but field trips have given the students useful experience in surface exploration and familiarity with the topography and the rural life of Palestine. Nelson Glueck, former director of the school, returned to Cincinnati in January and assumed the presidency of Hebrew Union College; Arthur Jeffery of Columbia University, a British subject, who succeeded Dr. Glueck as acting director, narrowly escaped compulsory evacuation during the civil disturbances of the spring. The director for 1947-1948 is Millar Burrows of Yale University. The Baghdad branch of the school continues inactive for the present.

SCHOOL OF AMERICAN RESEARCH

Sylvanus G. Morley has assumed the directorship of the School of American Research, in Santa Fé, succeeding Edgar L. Hewitt who died Dec. 31, 1946. The school had no excavation in progress in 1947, but reports accelerating activity and increased cooperation with the New Mexico Museum and other state archaeological enterprises.

AMERICAN SCHOOL OF PREHISTORIC RESEARCH

Hugh Hencken of the Peabody Museum, Harvard University, continues as director of the American School of Prehistoric Research. The school resumed its summer sessions in 1947 with excavations in palaeolithic and neolithic contexts at the so-called Caves of Hercules, near Tangier in Morocco, and field trips in central France.

EASTERN HEMISPHERE ORGANIZATIONS

In the Eastern Hemisphere, Sumner McK. Crosby of Yale University spent two months excavating at the Basilica of St. Denis, in the northern suburbs of Paris, recovering a unique bas-relief, transitional between Romanesque and Gothic, of the Twelve Apostles, and important new data on the eighth-century, Carolingian, church. Hetty Goldman, of the Institute for Advanced Study, Princeton, resumed her excavations at the great prehistoric and historic site of Tarsus, in southeastern Turkey. Thomas Whittemore of the Fogg Museum, Harvard University, spent his eighteenth consecutive season uncovering mosaics in the great Byzantine church of Santa Sofia, in Constantinople, with results as notable as ever. Bert H. Hill, former director of the Athens School, resumed his excavation on behalf of the University of Pennsylvania Museum at Curium in Cyprus, and P. Dikaios of the Cyprus Museum conducted a trial excavation at the neolithic site of Sotira, near Curium, for the University Museum.

WESTERN HEMISPHERE ORGANIZATIONS

Here the relatively quiet political situation permits normal field routines. The institutions participating in the Viru Valley, Peru, program of the Institute of Andaean Research are understood to be continuing their work. An expedition sponsored by the United Fruit Company, headed by Giles G. Healey and under the general supervision of A. V. Kidder of the Carnegie Institution, has made astonishing discoveries of sculpture and mural paintings at Bonampak in Mexico; Dr. Kidder continues his own explorations in Guatemala. Hellmut de Terra discovered a mesocephalic human skull in a deposit attributed to the close of the latest ice age, at Tepexpan, near Mexico City. The Chicago Museum of Natural History excavated a promising site of the Mogollon Indians near Reserve, in western New Mexico. William A. Ritchie of the Rochester Museum of Arts and Science spent the summer at two Munsee Indian sites on the Upper Delaware river, in northern New Jersey. The University of New Mexico continued its summer field sessions in archaeology and anthropology at Chaco Canyon. Perhaps most important of all, C. Bertrand Schultz, director of the University of Nebraska State Museum, reported the discovery, in April, July, and August of 1947, along Lime Creek in southwestern Nebraska, of three camp-sites of stone-age hunters, in a deposit stated categorically to be interglacial; if confirmed, this will constitute the earliest evidence (20,000 B.C. or earlier) for the presence of man in this hemisphere. These discoveries were made by anthropologists cooperating with the federally financed Smithsonian Institution survey of the Missouri River Basin, of lands to be submerged in 1949 by flood-control projects.

EXHIBITIONS AND COLLECTIONS

At home, a list of highlights of the year, in addition to mention made above, would certainly include the brilliant exhibition of Byzantine and Early Christian Art at Baltimore in the spring, an exhibition of ancient bronzes at the Detroit Institute of Arts, the acquisition of outstanding pieces from the Brummer collection by the Metropolitan Museum of Art, Dr. Francis Steele's recovery, from four fragments found at Nippur in the 1890's and since stored at the University of Pennsylvania Museum, of substantial portions of a Sumerian law-code clearly antedating Hammurabi, the appointment of an energetic young anthropologist, Froelich Gladstone Rainey, as director of the University of Pennsylvania Museum, the formation of the National Council for the Preservation of Historic Sites and Buildings, the organization of the Archaeological Survey Association of Southern California, pointing the way to further cooperative efforts of the sort, and the deaths of Clark Wissler, Ananda K. Coomaraswamy, and George Grant MacCurdy, in this country, and of Franz Cumont, Nicholas K. Roerich, and Julio Tello abroad.

Numerous anxiously awaited publications were reported to be in press; archaeological publications are exhaustively listed in the bibliographical sections of the *American Journal of Archaeology* and the *American Anthropologist;* no attempt, therefore, has been made to repeat the listings here.

PAINTING

By Florence S. Berryman
The American Federation of Arts

LOAN EXHIBITION OF FRENCH TAPESTRIES

The record of 1947 in the field of painting was one of settling down to normalcy. The year lacked the dramatic recoveries and restorations of priceless and historic art treasures by American troops in Europe, and other outstanding happenings such as had enlivened the first 18 postwar months.

The most important international art gesture involved not painting, but tapestry—the loan exhibition from France's cathedrals, chateaux, and museums, through the courtesy of the French Government, of 200 pieces of tapestry representing seven centuries of this superb art with irreplaceable and hence invaluable examples. Sent over as an official expression of gratitude for the United States' wartime and present assistance to France, it came on a man-of-war, the French cruiser *George Leygues*. Installed in the Metropolitan Museum of Art, and opened Nov. 21 (to remain through February 1948), it occupies 24 second floor galleries of the north wing, comprising more than an acre of wall space, and is regarded as the greatest loan of art from Europe to come to the United States. The exhibition begins with the Apocalypse series dating from 1375 and continues to present-day revival of the craft, in modern designs.

THE STATE DEPARTMENT'S TRAVELING EXHIBITIONS

The well-intentioned excursions of the U. S. Department of State into the sponsorship of paintings, ran afoul of two vociferous groups, conservatives and moderns. Both affairs had their beginnings at the end of 1945 and during 1946, respectively, as reported in The American Year Book for 1946 (pages 952-53).

Two collections of oil paintings, entitled "Advancing American Art," comprising 79 works purchased for $49,000 by Leroy Davidson for the State Department for five-year tours of the Eastern Hemisphere and Latin America, respectively, had had their initial showing at the Metropolitan Museum of Art, New York, in October 1946; and their radical character had aroused a number of conservative professional artists' organizations to protest to the Department. Nothing came of these protests at first, but after the 1946 elections, the Hearst press undertook a smear campaign, *Look* magazine reproduced a number of the paintings, and there were blasts over the radio. Women's clubs and other groups began to be aroused early in 1947, and Congress was flooded with letters from indignant taxpayers. President Truman, seeing one of the paintings (Yasuo Kuniyoshi's "Circus Girl") remarked "If that is art, I'm a Hottentot." Published in the press, his comment drew a telegram of approval from a group of Ringling Circus aerialists and bareback riders.

The two exhibitions of "Advancing American Art" had gotten as far as Czechoslovakia and Haiti, respectively, when the storm broke in Congress, and William Benton, Assistant

Secretary of State for Public Affairs, was questioned by a Congressional appropriation committee. The show in Prague had attracted such favorable attention that President Benes asked permission to send it elsewhere in his country, the extra cost of $6,000 to be provided by the Czech Government; and a prominent New York art firm offered to purchase both collections for 50 per cent more than had been paid for them. However, Secretary Marshall was reported to have said, apropos of the affair, "No more taxpayers' money for modern art," and the State Department canceled the tours.

Within a few weeks, in New York City, a meeting to protest the cancellation was called by Progressive Citizens of America, and co-sponsored by Artists Equity and six professional artists' organizations; and The American Federation of Arts, at its 37th annual convention held at the Metropolitan Museum, officially registered its protest. Such actions by a cultural minority had obtained no results by the end of the year. Benton resigned from the State Department Oct. 1, returned to his former position as chairman of *Encyclopaedia Britannica's* board of directors, and was elected chairman of the board of E. B. Films, Inc. He will continue to serve as a special consultant for UNESCO.

GERMAN MUSEUM TREASURES

An interesting postscript to the controversy over the German masterpieces sent to the U. S. in December 1945 for safekeeping and still in the National Gallery's vaults, was a talk by Francis Taylor, director of the Metropolitan Museum of Art, to the American Club of Paris, at the end of a summer tour he made of Germany. Hundreds of thousands of German museum pieces, he said, have disappeared behind the "iron curtain," and, unlike the German treasures in our custody, there is no public record of the Soviet holdings. He was pessimistic as to their future return to Germany, as he had heard that a German wing was being added to the Hermitage Museum in Leningrad.

INDUSTRY'S PATRONAGE OF ART

Pepsi-Cola Company, in its 4th annual competition "Paintings of the Year" bestowed upon 34 exhibiting artists, the largest sum of any annual —$35,950 in awards, fellowships, and purchases of paintings for the 1948 Pepsi-Cola calendar. The company was exemplary in refraining from influencing the selection of entries and awards; it left everything to professional artists, as they had demanded. Consequently, the poor quality of the exhibition of 159 works chosen from more than 4,500 entries from 46 states and the District of Columbia, caused commentators both modern and conservative to berate those responsible for the show, as an inept return for Pepsi-Cola Company's generosity.

The exhibition opened Sept. 30 at the National Academy. First prize, $2,500, went to Henry Kallem for "Country Tenement," mediocre modernism; 2nd, $2,000 to Lamar Dodd; 3rd, $1,500 to Joseph De Martini; 4th, $1,000 to Ethel Weiner; 5th, $750 to Max Weber; and there were 15 others of $500 each. Four fellowships of $1,500 each were again awarded.

Pepsi-Cola Company had reserved the right to buy its own selections for the 1948 calendar, and acquired only two of the prize winning paintings. In November, the Company opened an Opportunity Art Gallery at 9 West 57th Street, New York City, where young artists from many regions of the U. S. are given a chance to show work in the metropolis.

Heller-Deltah Company also increased its awards, giving $6,400 in the 1947 La Tausca Art competition, as against $4,500 the previous year. Abraham Rattner received first prize of $2,000; Philip Evergood, $1,500; Byron Browne, $1,000; Everett Spruce, $750; Yasuo Kuniyoshi, $500; Nicolai Cikovsky, $250; and four others, $100 each. All restrictions as to subject matter had been removed, and the exhibition, entirely invited, opened at the Riverside Museum, New York City, early in the year. Seven paintings were sold for $8,650. The show subsequently was circuited to nine museums.

The Miller Collection, assembled by Mrs. Burton G. Tremaine, Jr. and her husband, president of the firm manufacturing lighting equipment, had its inaugural showing at the Wadsworth Atheneum in Hartford, Conn. the end of the year, and was to be sent on a national circuit in 1948. It is composed of works by the School of Paris and allied experimentalists.

The final impact of the war on art was revealed in the exhibition of 16 paintings shown at Chrysler's International Salon, New York City, in February. Immediately after the war, the Corporation engaged Lt. Col. Charles Baskerville to direct the making of a record by painters with battle experience. They were given wide latitude as to subject, ample time, and adequate compensation. Several of the 16 paintings are notably outstanding: Joseph Hirsch's "The Burden," a deeply moving work; close behind it are Ogden Pleissner's "Tank Break-through at St. Lo," and George Grosz's "Juggernaut." Drawing crowds of approximately 800 a day in New York, the show had to be extended through April, after which it started on a year's tour of museums. It will hang eventually in Chrysler's executive offices.

The Gimbel Pennsylvania Art Collection was presented to the state Oct. 13 at the Pennsylvania Academy of the Fine Arts, Philadelphia. Sponsored by Gimbel Brothers, it comprises 114 oils, watercolors, and drawings, by 14 artists who were commissioned to "create a dramatic record of Pennsylvania and its contemporary people." The majority of the works deals with man in relation to the state's resources, industries, and history. The collection is now on a tour of Pennsylvania cities and towns.

MUSEUM ACQUISITIONS BY GIFT, BEQUEST, AND PURCHASE

Museums and art galleries throughout the United States continued to augment their collections with notable paintings of many schools, of which only a few outstanding works can be listed.

The Art Institute of Chicago received as a gift from Charles Henry Worcester, early in the year, $1,000,000 worth of paintings and a few works in sculpture, a total of 70 items, many of which had been on view as long-time loans. Included are such masterpieces as Gentile Bellini's "Two Orientals," Cranach's "Crucifixion," and Caravaggio's "Chastisement of Love." Besides early Italians, Dutch, and Germans, the group comprises Flemish, early, 19th century, and contemporary French, 18th century British, modern Spanish, and Americans.

The Los Angeles County Museum, by means of a cash gift of $250,000 from the Hearst Foundation, acquired 35 works of art ranging from Egypt's V Dynasty to the 18th century A.D., also eight contemporary American paintings.

The Toledo Museum purchased Lorenzo Monaco's "Madonna and Child" (about 1420) from the famous Cook Collection, England; El Greco's "Agony in the Garden"; and "The Family at Dinner" by Mathieu Le Nain, which was the focal point of a loan exhibition held at the Museum in October, of work by the three Le Nain brothers and their school.

The Detroit Institute of Arts purchased Sassetta's "Betrayal of Christ" (about 1440) and received as a gift from Mr. and Mrs. Edgar B. Whitcomb, Rogier van der Weyden's "St. Jerome in the Desert." The Institute also received as a gift Jordaens' "Holy Family with St. Anne"; bought a large sketch in oils, by Rubens, of Cardinal Archduke Ferdinand; and purchased for its American collections, Whistler's "Falling Rocket," the painting made famous by his libel suit against Ruskin, in which he won a farthing damages. The Institute paid $12,000 for it, many times the sum (200 guineas) that incensed Ruskin in 1875.

The William Rockhill Nelson Gallery, Kansas City acquired Carpaccio's "Portrait of a Lady," considered his best, by Venturi.

The M. H. De Young Memorial Museum, San Francisco, acquired El Greco's "St. John the Baptist."

The Cleveland Museum purchased a major work by Rubens, one of his seven portraits of his first wife, Isabella Brandt; also acquired Tiepolo's "Martyrdom of St. Sebastian" (about 1759); and a portrait of Don Juan Maria Osorio-Alvarez, known as "The Boy with a Linnet" by Goya, its placement in the Museum being its first showing in the United States.

The Metropolitan Museum of Art, New York City, acquired Poussin's "Rape of the Sabines" (about 1636) a very important addition.

The Boston Museum of Fine Arts acquired Poussin's "Achilles on Skyros."

The Albright Art Gallery, Buffalo, acquired Gauguin's "Yellow Christ," which is regarded as having inaugurated the new movement following Impressionism; it was looted by the Nazis and was one of the first paintings recovered and offered for sale in the United States.

The Museum of Modern Art, New York City, received its most important bequest in recent years of 20th century paintings, including "Conquest of the Air," considered Roger de la Fresnaye's masterpiece, and works by Juan Gris, from Mrs. P. A. T. Levene.

In addition to their acquisition of old masters, 18th and 19th century paintings, many American museums give incalculable aid and encouragement to contemporary American painting by their regular programs of purchase, often from their own annual exhibitions, from dealers' galleries, other exhibitions, and the artists themselves. These are, happily, too numerous to name.

EXHIBITIONS

Thousands of exhibitions of painting are held each year. Besides many large annuals and one-man shows which provide opportunities for living artists, there were, during 1947, superb old master and modern shows (in some instances representing months of careful preparation and cooperation between galleries), some to afford exhaustive studies of schools or individuals, others to celebrate anniversaries, to exhibit a city's resources, to commemorate artists recently deceased, to mark artists' centenaries, to introduce artists from abroad, or to benefit some worthy cause.

OLD MASTER EXHIBITIONS

The City Art Museum of St. Louis celebrated in October its 40th anniversary with an exhibition comprising 40 masterpieces, valued at $3,000,000, borrowed from practically all the important museums in the United States, as well as from Canada's National Gallery. It covered five centuries of western art from eight countries, ranging from 14th century Florentine to Winslow Homer.

Wildenstein & Company, New York City, showed in February 1947, the largest number of paintings by Italian Renaissance masters seen in New York since the World's Fairs. Nearly 50 masters were represented, all from the stock of the 81-year-old firm; they covered two centuries, beginning with 1350, in various schools.

Holland's greatest painters of the 17th century, Hals and Rembrandt, were celebrated in a great exhibition at Los Angeles County Museum in December 1947. Twenty-one paintings by Hals, 32 paintings, 54 etchings, and a few drawings by Rembrandt, emphasized the marked contrast between the two masters who were of the same race, lived at the same time, and had the same subject matter; yet Hals' paintings depict happy extroverts, Rembrandt's, brooding introverts. More than 3,000 people attended the opening.

French still life paintings constituted an important exhibition at Seligmann and Helft Galleries, New

York City, in November. It included 13 works by Chardin, as well as good representation of Cezanne, Courbet, Pissarro, Renoir, Manet, Desportes, and others. The Quaker Emergency Service was beneficiary of the admission charge.

Brooklyn Museum held a semicentenary exhibition early in the year, displaying samples of its treasures: early American paintings, Egyptian sculpture, drawings, prints, and decorative arts.

19TH CENTURY AMERICANS

A large number of exhibitions of 19th century painting reviewed the art, chiefly of Americans. The Detroit Institute of Arts and the Boston Museum of Fine Arts were co-sponsors for the first extensive exhibition of paintings by Washington Allston, early 19th century romantic, shown anywhere since 1881. Opening in Detroit in May, it was shown two months in each city.

William Sidney Mount, outstanding 19th century genre painter, and his brothers Henry S. and Shepherd Alonzo Mount, were commemorated in a large exhibition at the Suffolk Museum, Stony Brook, L. I. during the summer. It comprised 134 oils, more than 50 watercolors, drawings, sketches and prints, plus miscellaneous objects connected with them.

The Grand Central Art Galleries, New York City, celebrated their 25th anniversary in December (1947) with an exhibition of paintings by George Inness from the Watson Collection. The annual drawing of 100 lay members' names was held, each of whom received a painting or sculpture valued at $500 to $2,500. In the quarter century since he started the Grand Central Galleries, director Erwin S. Barrie had sold about $7,000,000 worth of American art (more than $1,000,000 worth by the late Frederick Waugh, marine painter).

An exhibition of oils, pastels, watercolors and drawings by James McNeill Whistler at the Macbeth Gallery in April, was the first showing of his work in New York City since the Metropolitan Museum's show in 1910.

A major loan exhibition of paintings and drawings by Winslow Homer, borrowed from some 25 museums and private collectors, opened at the Wildenstein Galleries in February for the benefit of New York Botanical Garden. It represented Homer's work from 1860-1909.

The Whitney Museum of American Art, New York City, commemorated two important centenaries during the year: Ralph Blakelock in May and Albert P. Ryder, in November. That of Blakelock was co-sponsored by City College (his alma mater) which was simultaneously marking its own centenary.

Mary Cassatt, most famous American woman painter and the only American closely associated with the Impressionists, was honored by the largest and most comprehensive exhibition of her work ever seen in New York. It was held in November (21 years after her death) at Wildenstein Galleries, for the benefit of Goddard Neighborhood Center, and comprised 84 paintings, pastels, and prints.

19TH CENTURY FRENCH AND OTHERS

The Cleveland Museum of Art worked for six months assembling an exhibition of work by Edgar Degas, hailed as "the most important in that institution's history," which opened in February 1947. Inspired by Cleveland's acquisition in 1946 of Degas' "Frieze of Dancers," the show comprised loans from all parts of the country, including 87 paintings, drawings, and sculptures.

A loan exhibition of 88 oils and watercolors by Cezanne, 20 of them not seen previously, said to be perhaps the largest display of his work yet held in New York City, was held at Wildenstein Galleries in April, for the benefit of the New York Infirmary. It comprehended Cezanne's work from 1863 to 1906.

Adolphe Monticelli was the 19th century artist featured to celebrate the 106th birthday, in March 1947, of

Robert C. Vose Galleries, Boston, and the 50th anniversary of Vose (the 3rd generation) as an art dealer. The exhibition, comprising 32 paintings lent by museums and private collectors, was the best show of Monticelli's work in many years.

20TH CENTURY AMERICANS

George Bellows, the most famous painter born in Columbus, O., was commemorated by the opening, Oct. 14 (22 years after his death) of a "Bellows Room" in the Columbus Gallery of Fine Arts, containing seven of his paintings, the largest number of his works in any museum collection.

Charles W. Hawthorne, best known for his Provincetown fisher-folk, was commemorated 17 years after his death, with a memorial exhibition of paintings at Grand Central Galleries in November.

John Steuart Curry, who died in 1946, was given a retrospective memorial exhibition at Associated American Artists, New York City, in March and April; the show covered two decades of his painting.

Alexander James, noted Boston painter, son of William and nephew of Henry James, who died in 1946, was given a memorial exhibition of more than 70 of his paintings at Currier Gallery, Manchester, N. H. during the summer, at the Boston Museum of Fine Arts in autumn, and at the Corcoran Gallery of Art, Washington, D. C. in December.

Ladislaus Moholy-Nagy, Hungarian-born artist and one-time professor at the famous Bauhaus in Weimar, with tremendous influence on modern design, who died in 1946, was commemorated with an exhibition of his paintings and works in other media at the Museum of Non-Objective Art, New York City, in June.

John Marin had a large retrospective exhibition, the first in 10 years, at the Institute of Modern Art, Boston, in January and February 1947, and later came to the Phillips Memorial Gallery, Washington, D. C. At the former, it drew an attendance of 200 daily, which is large for Boston.

20TH CENTURY FRENCH AND OTHERS

"Painting in France (1939-46)" filled all the exhibition space at the Whitney Museum of American Art, New York City, in February, with 117 paintings by 67 young French artists. Critics found it too imitative of modern movements from the Fauves on.

Pablo Picasso was thoroughly reviewed during the year in three exhibitions in New York City: in January and February, his work between the two World Wars, at the Paul Rosenberg Galleries; and his latest paintings at the Kootz Gallery; and in November, paintings of his "Blue" and "Pink" periods (before 1906) at the Knoedler Galleries, which broke all its previous attendance records, as during the first three weeks, 20,000 people paid admissions for the benefit of the Public Education Association.

"Contemporary British Painters" opened at the Albright Art Gallery, Buffalo, early in the year, whence it traveled to many other museums throughout the country.

THEME SHOWS

Size was the theme of an exhibition of 21 large scale modern paintings at the Museum of Modern Art, New York City, in April; some measured up to 13 x 16 feet.

"Masterpieces of Philadelphia Private Collections," shown during the summer at the Philadelphia Museum of Art, brought together for the first time, 204 oils, watercolors, and prints, from 23 local private collections. It was a comprehensive survey of the leading art movements from 1800 to 1946.

"Abstract and Surrealist American Art," at the Art Institute of Chicago in November, replaced its annual All-American exhibition of more than 50 years; it was announced as "the inauguration of a series of theme-exhibitions." Institute staff members had traveled some 24,000 miles to select the 256 exhibits. Sixteen prizes and mentions totaled $5,300.

AMERICAN GROUP SHOWS

The National Academy, New York City, held its 121st Annual in two parts. Part I, paintings, sculpture, watercolors, and prints, invited work of non-members, shown in January 1947, was a generous gesture, including bestowal of all the regular prizes but criticized as having too many items seen elsewhere previously. Part II held in April, comprised work by members with eight prizes contributed by the Academy, awarded in different mediums.

The Pennsylvania Academy of the Fine Arts 142nd annual in February, turned sharply to the left, emphasizing "the how" instead of "the what" in painting. Heavily weighted with abstractions, it was one of the poorest shows in years.

The American Watercolor Society's annual, at the National Academy in February, filled 10 galleries with 356 paintings, excellent in technique and craftsmanship.

The Corcoran Gallery of Art, Washington, D. C., opened its 18th Biennial exhibition of contemporary American oil paintings (300 works) the end of March 1947. Clark and Corcoran awards went to: 1st, $2,000 and gold medal, Sigmund Menkes; 2nd, $1,500 and silver medal, Walter Stuempfig; 3rd, $1,000 and bronze medal, Jack Levine; 4th, Clark prize and honorable mention to Hobson Pittman. Three other mentions were given.

The Brooklyn Museum's 14th International Watercolor Biennial in May had foreign representation for the first time since the war. The British section of work by 29 artists was outstanding. The American section represented 78 artists, the Italian 16, and there was a group from France.

The National Association of Women Artists' 55th annual in May at the National Academy, New York, was particularly good, being composed (apparently) of works especially created for it rather than by items sent in by dealer-representatives.

The venerable St. Botolph Club of Boston inaugurated in May, a national American Water Color Exhibition. The first edition was a brilliant affair, including 200 paintings, ranging from academic to abstract, hung in three parts: at the Club, the Vose, and Doll & Richards Galleries, each section centered around a prize-winner.

Artists of Chicago and vicinity, in their 51st annual at the Art Institute during the summer, replaced familiar conservatives and radicals with young abstract and semi-abstract artists' works. Fifteen prizes awarded totaled more than $2,600.

Los Angeles County Museum's 8th annual in May of work by artists of Los Angeles and vicinity, had repercussions. Critics panned it for being too small (50 paintings, seven sculptures) and too narrow. A rejected painter picketed the Museum, charging Red propaganda. Subsequently, 20 paintings by other rejectees were set up on the Museum's front steps, and one of these artists spoke against "degenerate, un-American work" to a crowd which kept five policemen on hand. Other forms of agitation were practiced. Furthermore, a used-car dealer sponsored a three-day show of "sane American art" in the Hollywood Athletic Club gymnasium, at which silver cups were awarded.

At Springfield, Ill., the first Old Northwest Territory Exhibition opened Aug. 7, to be an annual event for Ohio, Michigan, Wisconsin, Indiana, and Illinois artists. From 600 submissions, the jury chose 133 works, including 57 oil and 26 watercolor paintings. Dean Ellis of Cleveland, winner of the first prize of $1,000 and Maxwell Gorden of New York the second of $500, led 14 recipients of $2,900 in cash prizes.

The Carnegie Institute's annual in Pittsburgh in October, continued to be an all-American show. Invited by Homer Saint-Gaudens, it comprised 300 paintings by mature, established artists, ranging from extreme left to right. Prize winners were Zoltan Sepeshy, $1,500; Joseph Hirsch, $1,-

000; Eric Isenburger, $700. The general public remained faithful to clean-cut realism, and awarded the Popular Prize of $200 to Charles Gilbert for "Tree Portrait."

The Whitney Museum's annual of contemporary painting, New York City, which opened in December 1947, was dominated by abstract art. It included nearly 30 artists who had been represented in its first annual, 1932, also 28 showing there for the first time.

The Audubon Artists' 6th annual, New York City, in December, was smaller than in 1946, higher in quality, and presented under one roof. It comprised 495 works, nearer conservative than experimental; 229 oil paintings and 140 watercolors, the remainder sculpture and graphic arts. Gold Medals of Honor went to Nicholas Ziroli, William Palmer, Armin Landeck, and Lu Duble for the respective mediums.

The Metropolitan Museum, New York, set a fine example of an established, rich institution lending its works to less favored places. It made loans generously, throughout 1947, to institutions and organizations both in the United States and Europe. For example, "30 Masterpieces" of painting from Italian Renaissance and early northern works, including a Rembrandt, up to Rosa Bonheur's "Horse Fair" were shown at the Dallas Museum as a feature of the Texas State Fair in October and November.

PROFESSIONAL AND MUSEUM COOPERATION

Artists Equity Association was formed early in the year, and held its initial meeting April 30 at the Museum of Modern Art, New York. Hudson D. Walker was appointed executive director, to carry out a program for the economic and legal welfare of the artist, eschewing political, esthetic, or cultural matters. Headquarters was established at 400 Madison Avenue, New York City, and membership is open to any artist of professional status, defined as one having had a one-man show, representation in a museum, etc. Shortly after its formation, it had a membership of 150 leading painters and sculptors.

In September, the Metropolitan, Whitney, and Modern Art museums, New York, made an agreement of cooperation and coordinated activities, to avoid duplication of effort; the Whitney to concentrate on American art; the Museum of Modern Art, American and foreign art in modern idioms; the Metropolitan, older classic art. The initial transaction involved the sum of $191,000 to be paid in four installments by the Metropolitan to the Modern, for works considered to have stood the test of time: paintings by Cezanne, Picasso, and other late 19th and early 20th century works.

VARIA

Andrew Wyeth was the youngest artist ever to be awarded the American Academy of Arts & Letters Medal of Merit and $1,000 cash prize, given to him at joint ceremonies on May 22, of the Academy and the National Institute of Arts and Letters. The award is bestowed upon a painter only once in five years.

The American Academy in Rome awarded 4 fellowships, the first given since 1940 and each worth about $3,000. Two for painters, which began Oct. 1, went to William Thon and Charles Owen.

The Veterans Administration reported that, of 1,825,000 veterans enrolled in educational institutions under the G.I. Bill, more than 51,000 were taking courses in art and architecture. An additional 8,500 veterans were studying art in colleges.

Progress was made in telecasting art during the year. Art programs in black and white over television were effective, and experiments in color telecasts went forward. Hans van Weeren-Griek of Netherlands Information Bureau presented two experimental 15-minute programs over WPTZ, Philadelphia, so successfully that the time was extended to half an hour, and the series to two months. "You Are an Artist," featuring Jon Gnagy, a painter and teacher, oldest existing program of the kind on NBC television network, was a year old during 1947 and had a sponsor, Gulf Oil Refining Company. "On Exhibit" and "Living Art," telecast from museums over CBS, are seen occasionally.

Springfield (Mass.) Art Museum finally unveiled, Oct. 5, the mural painting in its library, which had had its inception at the beginning of the war, with a national competition, the cost to be financed by the Van Norman Machine Tool Company. In 1943, Pvt. Sante Graziani A.U.S. received the commission; he is now an instructor at Yale School of Fine Arts. The mural symbolizes the building of the museum, its connection with the arts and its community.

AUCTION RECORDS

Auction sales at the Parke-Bernet Galleries, New York City, topped the $6,000,000 mark for the 4th consecutive season (1946-47). The total of $6,019,153 was fetched by 98 sales at 195 sessions. There were few outstanding individual collections; sales comprised groups of properties. Jewelry, furniture, and rare porcelains obtained higher prices than collections of paintings. The season's sensation was "The Bay Psalm Book," the first book printed in North America; it went for $151,000 the highest price ever paid for a printed book. Mme. Vigee-Lebrun's self-portrait with her daughter, fetched $21,000, the highest price for a painting during the season. Other top prices for paintings were: Watteau's "La Danse Paysanne," $14,000; Sorolla's "Playa de Valencia," $13,500 (a record for him); Hans Burgkmair the Elder's portrait of an architect, $13,000. Only eight sales were entirely of paintings, but a total of more than 2,300 representing all schools were sold during the season.

The Gustave Dore collection, discovered in May in the Manhattan Storage Warehouse, New York City, after having been "lost" for half a century, was the center of a peculiar auction sale (or sales) held Sept. 9, and later, in a corner of the warehouse, for the payment of a 20-year storage bill. The collection comprised nearly all the oils painted by Dore, as well as drawings and prints; in the 1890s it was insured for $1,000,000 and was exhibited to 6,000,000 people. The paintings were large, measured by feet, and fetched bids of only a few hundred dollars. An offer of $100,000 had been refused for one of them half a century ago.

On Sept. 9, the collection was auctioned off, lot by lot, to a number of buyers, for a total of $10,828. Before they could take possession, it was immediately resold in its entirety for $12,500 in response to the bid of John M. Holtzworth. The following day, he was in jail for passing bad checks to a total of less than $100. The collection remained in the warehouse, Holtzworth was held by the F.B.I., and one bidder implemented a writ of replevin for several paintings he had bid in.

The collection was auctioned for the third time at the same place, on Oct. 28, fetched $12,917.50. The highest price was $2,100 paid for "The Triumph of Christianity Over Paganism," often regarded as Dore's greatest painting.

SCULPTURE

By Rose V. S. Berry
Art Critic and Writer

GENERAL

Sculpture, as a fine art, has a history peculiar to itself. It is much less a hybrid statement than the opera. Nevertheless, to separate it from painting, drama, and architecture, the time came when there was a parting of the ways. Strangely enough, the separation was brought about by Ghiberti's bronze doors of the Florentine Baptistry, whose unapproachable beauty has held them in first place for five centuries. While American sculpture was not born of Ghiberti's triumph, nor of the trend established by Donatello, they established standards of taste that have influenced all modern sculpture.

For the sake of a sequence and a brief retrospective glance at American Sculpture, the student should recall the work of the American men who took their training in Florence and Rome, and later that larger group who trained and profited by the verve and freshness of the Parisian art schools. In the meantime, America was freeing itself from its puritanical attitude toward sculpture, and accepting, often with a grudge, the truly artistic or creative approach to the art.

LOOKING BACK A CENTURY

With 1947 in mind, the writer turned back one century to see what the American sculptor was doing. In 1847, he had cast his first bronze equestrian statue. In the intervening century America has produced more equestrian statues than any other country. Its civic and monumental groups hold their own with most modern work. When American sculptors began to exhibit at the Venitian Biennials, the European critics were the first to declare that the Americans had a spirit of vigor, honesty, and characterization that set them apart in the realm of sculpture.

In 1929, when Mr. and Mrs. Archer M. Huntington financed the big sculpture exhibit in San Francisco, it was the foreign critics who turned the attention of the art world to the exhibit by the Golden Gate, and it was the Americans, who, accustomed year after year to the best that the National Sculpture Society put on in New York, heralded abroad that something startling was being shown in San Francisco.

Consider what happened in New York when the question under discussion was what bronze statues should be melted down if the metal were needed for the war. The result was something every sculptor and sculpture-lover should heed. From the hundreds of statues in the city, ten were selected for analysis, to be judged by a fearless committee of six. Only three: George Washington and Horace Greeley, by J. Q. A. Ward, and Nathan Hale, by Frederick MacMonies, received unanimous approval. Benjamin Franklin, by E. Plassman, received five favorable votes; General Sherman, by Augustus Saint Gaudens, received four votes. Father Duffy, by Charles Keck, received one and one-half votes, the half vote coming from a committee-man who changed his mind. Theodore Roosevelt, by James E. Fraser, received one vote. "Atlas," by Lee Lawrie, and the Battleship Maine Monument, by A. Piccirilli, were unanimously turned down.

This backward glance has come about by the statement often repeated in the art news of the press "that 1947 has been a favorable year for the sculptors," and that sends one with a thrill to review the record.

WHITNEY SCULPTURE EXHIBIT

The Whitney Sculpture Exhibit was the outstanding event for sculptors. Seventeen of the exhibitors are showing for the first time, and the 76 sculptures offer much of interest. To mention only a few one must include: Gordon Cutler's "Dragon," carved from diorite; Richard Barthe's reverential figure of "Mary"; José de Creeft's imposing "Shulamite"; Harvey Fite's "Play," figures of a child and mother; George Aaron's "Jeremiah, Pour Forth Thy Wrath"; Barlach's "Avenging Angel"; Alfeo Faggi's "From the Cross"; Robert Laurent's "Melisande"; "Rhythm," by Gwen Lux; Mitzi Solomon's "Lovers," which roused approval strong enough to overcome opposition; Koren der Harootian's "Leda and the Swan."

Though the list is by no means exhausted, it must end with the charming portrait of "Linda Wu," by Oronzio Maldarelli. The animal subjects are fewer than usual, but some of them are excellent. It should be noted here that the Whitney Museum has always had a generous sponsorship and a fearless Director, even in the face of local conservatism. After years of uncertainty and worldwide confusion the collection is more in tune with the moment than any other which the Metropolitan Museum has had to accept.

NATIONAL ASSOCIATION OF WOMEN ARTISTS

The 55th Annual Exhibition of the National Association of Women Artists made a new name for itself and took on importance because of the character of its exhibition. One reviewer of the collection thought that some degree of freshness and verve came from the fact that the exhibitors had worked largely in their own studios. One element had never entered this annual before—the sculptors came dangerously near stealing the show. Among the outstanding items were: "Evacuee," by Gwen Lux; "Mother and Child," by Arline Wingate; while notoriety centered upon "Lovers," by Mitzi Solomon; an impressive piece was the "Elephant Head," done in black Belgian marble, by Grace Trumbull.

OTHER EXHIBITIONS

The Toledo Museum put on the first pretentious exhibition in ten years, the collection is divided between 50 European and American sculptors. The items include variety in mediums: lead, aluminum, glass, and plastic, in addition to the traditional bronze, stone, and marble. Sculptors included are Calder, Callery, de Creeft, De Rivera, Epstein, Flannagan, Gross, Laurens, Lachaise, Laurent, Maldarelli, Noguchi, Umlauf, and Zorach.

The Pen and Brush Club made its initial showing of what is to be an annual sculpture exhibition. Restricted to club members, the collection contained 50 pieces; 17 were heads; five were animals; 10 were nudes; five draped figures, mostly mothers and children. The Jury of Awards consisted of José de Creeft, Donald DeLue, and A. A. Weinman. First prize went to Marion Sanford's "Tiny," and second to Eleanor Mellon's "Wava May." Other outstanding pieces were Ruth Nickerson's "Black Narcissus," Katherine Lan's "Wild Rabbit," and Melvina Hoffman's "Three Heads."

JO DAVIDSON

Jo Davidson's position as a sort of Grand Old Man of American sculpture was made more evident by his first retrospective exhibition which covered at least a 40-year period of achievement. One visitor said: "You need not expect to find improvement in Jo Davidson's work because he started at the top." This exhibit occupied five large galleries. His installation was by no means the smallest factor in the show. Although there were five full-length figures, a single female torso, and many portrait heads or busts, mostly in bronze, Davidson avoided even the semblance of confusion by grouping kindred subjects—those related chronologically and those associated with some vastly important field.

Latin American leaders such as Ortiz, Medina, and Baldomir, which were done in 1941, were pedestaled in one corner. The FDR-group, including Wallace, Senator Norris with La Guardia, Bernard Baruch, and others were done between '32 and '42 with few exceptions.

Grouped together and inseparable in the minds of all were the outstanding military men of the First World War, including Marshals Joffre, French, and Foch, with Generals Pershing, Harbord, Diaz, and others. These are the exceptional pieces too, because Davidson found it necessary to do them from the chest up to reveal their military medals and epaulets.

OTHER ONE-MAN EXHIBITIONS

David Smith, whose work is invariably suggestive of a strange off-earthish life that is threatening, defiant, but interesting, even though it never lived, is in no sense of the gremlin-order. His medium—iron—marks him as a fearless artist.

Henry Schonbauer held his one-man show at the Binet Gallery. He works in glowing mahogany, gleaming lignum vitae, grained maple, and other woods with hearts that lend themselves to the development of human bodies out of the core. These creatures, born of Schonbauer's chisels, are so well thought out that they appear to have been discovered in the grip of mood or emotion.

Chaim Gross gave his exhibition variety and interest through medium, theme, and size. His 30 sculptures are the first he has shown in five years. Any observer, with an eye for sculpture and a memory that goes back five years, will see in the collection the element that makes the whole 1947 season one of the most outstanding since 1939, when the National Sculpture Society gave its membership that wonderful exhibition at the Palace of the Legion of Honor in San Francisco.

Arline Wingate, in a first exhibition in 10 years, showed exceedingly interesting portraits, most of which are of fellow artists. Among the most attractive is a simple presentation, delightfully executed, of Abraham Walkowits. That he is favored by portrait painters is proved by the fact that his likeness has been secured by 100 canvases and drawing sheets. Other portraits are Waldo Pierce, Rhys Caparn (Mrs. Johannes Steele), and Prince William of Sweden.

Cornelia Chapin, Lu Duble, and Marion Sanford put on a delightful exhibition at the Grand Central Galleries. The Mexican work by Miss Duble was executed under fellowships from the Guggenheim Foundation and the International Institute of Education. Miss Chapin's work included some fine animal studies that, throughout the art season, had been selected from other collections and exhibitions as outstanding. Miss Sanford's group of 16 sculptures was attractive for several reasons, one being that every one had been a prize winner in its own right.

Doris Caesar is showing a comprehensive collection of her work for the first time in seven years. The artist has made her exhibition chronological by carefully including at least one piece of work for each of the seven years. The balance of the collection is selected from the work of '46 and '47. Her achievement here is one of steady development, showing the growth of a sincere artist. Among the personal characteristics of her work one notes her treatment of hands as indices of character. Hands have long occupied the interest of artists. One of the most admired Renaissance paintings of the "Last Supper" is Leonardo's superb study of 12 pairs of hands.

Cleo Hartwig, in 1947, presented 22 items, including "Polar Bear," "Tropical Fish," "Little Bird," "Chrysalis," and "Cat." Some were carved in wood and stone, others in terra cotta, brass and plaster.

Peter Fingsten is one with whom American art lovers are not as familiar as they will be. He is 30 years old and is presenting what might be a 30th exhibition. He is one of the fortunate persons never to have wrestled with an apprenticeship or the difficulty of finding a place for his work. He has studied in Vienna, Paris, Milan, and Berlin. His first exhibition was given at the age of 16. At 18, he was teaching sculpture. At 22, he shared a gallery with Picasso. "Elegy," included in the present exhibition, is one of the most arresting sculptures seen in recent years.

Anita Weschler's 14 items of sculpture are covered by an over-all theme, "Human Events," which she has presented in antithetical pairs suggested by some of the Biblical wisdom of Ecclesiastes: "A Time To Be Born" and "A Time To Die"; "A Time To Embrace" and "A Time To Cast Away," etc.

Robert Laurent is well-known and yet his one-man show of 24 pieces reestablishes his preëminence and craftsmanship in various stones, alabaster, and woods. The most recent work reveals an increased simplification.

Charles Salerno's exhibition netted him 14 sales. He is largely self-taught, but has learned a great deal from John Flannagan.

Alexander Calder's mobiles and stabiles continue to fascinate visitors to the modern exhibitions even more than they baffle visitors and critics alike. Jean-Paul Sartre said in 1946: "A mobile does not suggest anything; it captures genuine living movements and shapes them. Mobiles have no meaning, make you think of nothing but themselves. Mobiles *are*, that is all; they are absolutes. There is more of the unpredictable about them than any other human creature. No human brain, not even their creator's, could possibly foresee all the complex combinations of which they are capable. Such hesitations, resumptions, gropings, the sudden decisions and, above all, their swan-like grace make of certain mobiles strange creatures indeed."

PORTRAITS IN SCULPTURE

In addition to the portraits listed among Davidson's 93 exhibits, and many others, the Clay Club Galleries in Greenwich Village exhibited some outstanding work, including Staik Young's portrait of Jane Wasey; a penetrating study of Arturo Toscanini, by Dario Viterbo; and Malvina Hoffman was at her best in her characterization of Wendell Willkie.

Richmond Barthé, the Negro sculptor, exhibited a series of portraits especially interesting to theatregoers, among them Maurice Evans as Richard II, Laurence Olivier as Hotspur, Katherine Cornell as Juliet, and Judith Anderson as Mary.

PURCHASES AND PLACEMENTS

Pennsylvania Academy of Fine Arts purchased a small Jennewein bronze for its collection. Chicago's 51st Annual Exhibition purchased "Lambs" to which it had awarded Sylvia Judson its first sculpture prize. Philadelphia artists bought Rosin's "Reclining Nude," and presented it to the Philadelphia Museum of Art.

An excellent bronze bust of the late Senator Borah was unveiled in a permanent setting in Washington, D. C. Although Bryant Baker, the sculptor, was present, no mention was made of his name.

In Fort Worth, Tex., an equestrian statue of the late Will Rogers was unveiled on his 68th birthday. General of the Army Dwight D. Eisenhower was guest of honor for the event. The statue was the pivotal point of the whole ceremony, but there was no mention that the sculptor was Electra Waggoner Biggs. The same thing happened to Augustus Saint-Gaudens in Chicago when his Lincoln was unveiled. A black granite head, a Zorach masterpiece, was placed in San Diego's Museum.

AWARDS AND SCHOLARSHIPS

Prix de Rome was given to Concetta Scaravaglione, the first woman to receive the enviable honor. Albert Wein received the second award.

Palm Beach Annual awarded its three prizes to Berta Margoulies for her "Bather"; to Margaret Abel for "Exorcism," and to William Zorach for his famous head of "Myra."

The Tiffany Foundation Scholarships for '47 for sculptors included Walter Addison, $2,000; Peter Fingsten, $1,000; Leonard Baskin, $1,000; and Ralph Menconi, $1,000.

Prize winners in the January National Academy Exhibition were Jean de Marco's "Christ and His Disciples," Peter Dalton's "Seated Figure," Harry Rosin's portrait of "Folinsbee," and Henry Kreis' ably executed "Young Girl."

Guggenheim Fellowships were awarded to Berta Margoulies and Ruth Nickerson.

The Pennsylvania Academy of Fine Arts had a fund of $13,000 in 1947 for cash awards; $6,000 was expended in purchasing prize-winning works for the Academy's permanent collection. The committee consisted of Bruce

Moore, chairman; Janet de Coux, and Robert Laurent.

INNOVATIONS IN SCULPTURAL ACTIVITIES

Up to 1947, exhibitions, commissions, casual placements, etc., have been entrusted to State Art Commissions, or to builders of civic and private interests. From now on, such assignments will be dispersed by able business men, those who are usually behind the scenes as Museum Boards, local, and State Art Commissions. The most interesting phase of this venture is that it will be carried out and delightfully achieved by far-reaching business concerns. For instance, *Encyclopaedia Britannica*, which has been an exclusive patron of painting, announced in 1947 that from now on it will sponsor sculpture as well.

Among large business corporations sponsoring sculpture from this time are the Tecla Pearl people and Pepsi-Cola. Procter and Gamble years ago led the way with Soap Sculpture Exhibitions, which left an entranced public. They made the undertaking extensive and official, by increasing the number of cash prizes; by adding children's, juvenile, and adult competitors. These classes were judged by different professional Jurors, but the final decisions were always in the hands of excellent sculptors.

With this 1947 exhibition—its third—the La Tausca Art Competition will have a five-member Jury of Awards. These men will be named by a previously appointed Invitation Jury of Artists and Museum Directors.

Other changes that 1947 brought to the American Sculptor are those that come *via* inexorable Time. Names of large numbers of young gifted artists have appeared and will continue to appear. This ten-year interim before and since the War will do for present sculpture organizations what the Whitney Museum did for older men—now prominent.

Another change always comes when death steps into the artist's fold. In 1947, four notable men were taken: Hermon A. MacNeil, Edward MacCartan, Elie Nadelman, and Joe Mora, of Monterey, California.

Hermon A. MacNeil, aged 81, has done prominent work for all recent American, national, and international exhibitions. His "Who's Who in American Art," carried by the *Art Annual,* is too much to include here, though he deserves that his passing should be observed by its publication. His work had rare excellence. His subjects were presented with sympathetic understanding. His recognition was very general. His prizes and awards from everywhere.

In the passing of Edward MacCartan, an artist has been lost who has stood to the fore for many years. His work included a variety of subject matter, which he presented in exquisite detail and winning, graceful poses. A modest man, himself, MacCartan's place was among meticulous craftsmen, whose skill freed his every artistic utterance.

Elie Nadelman's death later in the year took a talent that was unique among American sculptors. When he returned from Paris, his Boulevard-Restaurant groups, done in the open, attracted wide attention. Seated about thin metal-legged tables, the caricatured public laughed and gossiped. Opposed to this very original and rather prolific output, Nadelman confined his work to large pre-Phidian heads done in pure white marble. In content, they are as remote from today as any archaic Greek statue. In Nadelman's modesty, however, he would probably insist that his greatest contribution to New York City consisted of the 15,000 items he and his wife donated to the Worker's Museum.

Joe Mora, the California sculptor, was a great loss to the West. He was among the last of the famous Spanish families. Though he was versatile in every phase of coastal life, he was possibly rarest and best in his knowledge and love of Spanish Colonial history. Having spent nearly all his life about Monterey, one of the oldest coast towns, Mora knew the people.

Padres and priests were his friends; every member of the parish was a neighbor. The Indians and the half-breeds were friends of Mora and the flocks. In bas-reliefs and statues their likenesses left his studio, as sincere, dignified statements of a time long past.

One of the most outstanding commissions of the Panama Pacific International Exposition was deputized to Joe Mora. He worked a pageant of the Portala into a glamorous, romantic, retrospective re-enactment, unlike anything ever seen. It was a panorama. Every object, item, and living being in the moving mass had been painstakingly sculptured by Mora. Then they were installed, and Mora proceeded to color them and to utilize Ryan's amazing lighting system, which was made absolutely fairy-like by its controlled indirectness, capable of the most delicate change.

By using the Ryan lighting system it was always some time of the day, very much like the out-of-doors, with a difference: the mechanics could stop the passing of the sun, hold the majesty of dawn, and hasten the noon-glare. In all this glory of color, the Spanish grandees and soldiers, brilliantly caparisoned horses, finely bred dogs, and curs that follow such a motley mass, literally lived as they advanced, in this California pageant that took place 200 years ago. Then one night fire broke out and rapidly burned that part of the temporary pavilion. Not one precious sculptured object was saved. Joe Mora's vision of California's grand Spanish epoch was in ashes.

ARCHITECTURE

By Frank G. Lopez
Technical Editor, *Progressive Architecture*

GENERAL

An expected number of difficulties beset the practice of architecture during 1947. Most architectural offices were extremely busy, since there had by no means been sufficient time since the cessation of hostilities in the Second World War for catching up with the tremendous backlog of work that had been built up during those years when no normal building could be done. But there was a shortage of draftsmen and other competent professional help; manufacturers of many kinds of building materials were having production difficulties; costs of construction went sky-high and gave no promise of receding; building labor of some types was scarce, and what there was produced less than formerly; and all these factors, added up, often led to the practice of preparing complete plans and specifications for buildings only to shelve them without starting construction, to await a time when difficulties would be fewer.

Nevertheless a great many buildings were built. Esthetically—if the cultural and the practical can be separated in architecture—there began to be visible a greater degree of public interest in what is called "modern" architecture, even in the conservative residential field. Of course, there were many times as many houses of traditional styles, particularly among those built for speculative sale. There was also much innovation in construction materials and technics, a natural consequence of difficulties with familiar materials and the high cost of labor.

BUILDING MATERIALS

By October, production of building materials of all types had reached a level 56 per cent higher than the monthly average in the year 1939, according to Department of Commerce indices. Some materials were available in totally unprecedented quantities—gypsum board shipments were over 500 per cent of the average in 1939; warm air furnaces, 266 per cent, for instance—and only a few items of basic materials or equipment lagged behind 1939 production—mechanical stokers, for example, had reached only 97 per cent of pre-war production.

THE PROBLEM OF WOOD

But if we were producing at that rate by October, we had not been in all the months since the end of the war, and the accumulated backlog of demand was still far from satisfied. In the matter of quality, a few types of products were almost uniformly unsatisfactory. An example was wood, in nearly all the forms in which it is used in construction. Most wood available during the year was improperly seasoned, or of poorer grades than architects normally wish to employ, and so costly that, in some regions at least, wood began to give way to other materials. An architect in Hanover, N. H. found it cheaper and more sound structurally to use lightweight steel members for the framing of houses, and relied upon wood only for less important uses. This was true in spite of lumber production which approached the wartime high of 36,000,000,000 board feet in 1942, according to estimates of the National Lumber Manufacturer's Association. By the time the building contractor in Hanover had figured in the cost of transporting structural lumber from Washington and Oregon, the high cost at the mill, and the cost of difficulties of using the quality of material available, steel framing, though not intrinsically cheap, proved less expensive.

PRODUCTION LAG IN BASIC MATERIALS

Materials which were slow throughout the year in building up production percentages to pre-war levels included hardwood flooring, brick, cast iron products (radiators, bathtubs, etc.), and sheet steel products. Judged by total pre-war consumption there was no shortage of sheet and strip steel, but there was considerable competition for the available tonnage between building product manufacturers, equipment manufacturers, and such other producers as the automobile industry, which was itself experiencing a tremendous demand. Further, the lag in production of some of these basic materials accentuated the demand for others to be used in their place. Also, the trend toward such building practices as "dry-wall" construction (in which interior and exterior wall surfaces are formed as much as possible of materials applied in large sheets, eliminating the delays caused by waiting for moisture to dry out of other types of construction) increased the demand for sheet products like asbestos-cement board, gypsum board, and plywood.

NEW TYPES OF BUILDING PRODUCTS

New types of building products which became more widely used during the year include mechanical cores, or units in which are combined, at the factory, all kitchen and laundry equipment, bathroom fittings, and a complete heating system; these are intended chiefly for mass housing developments. There was also more extended use of Vermiculite, an aggregate for concrete and plaster, formed of expanded mica, and contributing to the final material considerable thermal insulation, acoustical absorptive properties, and substantial weight reduction. Multi-layer insulating glazing—glass with dehydrated air-spaces between layers—came into wider use, mainly in houses. A device for insertion in air-conditioning systems, for cleaning the air by means of static electricity, had achieved some popularity in industrial and commercial structures; models were developed and marketed by several companies for residential use. There were many others, too many for listing in such a brief review; it is doubtful if ever in the history of the

American building industry have there been so many new products introduced in such a short space of time.

CONSTRUCTION COSTS

Early in the year construction costs caused the postponement of many building operations, in all types of construction—industrial, commercial, institutional as well as residential. In the industrial field, for example, only in those cases when not to build would have been more expensive than to build whatever the cost, did construction proceed. And as likely as not, costs would zoom upward while construction was in progress. Wise builders accepted contracts only on a cost-plus basis, and the owner usually found, before the building operation was concluded, that his structure was costing him anywhere from 10 to 50 per cent more than had been estimated. This could not be blamed on any segment of the industry in particular; it was spread over all, and reflected the boom economy prevalent.

By the end of the year, according to United Industrial Associates, Inc., of Washington, D. C., who base their figures on Department of Commerce and Bureau of Labor Statistics data, the price tag on the average American house had jumped from $4,599 in 1939 to $10,648, more than double. Los Angeles, they state, was the most inflated market; there prices almost tripled in the same period; New York, Chicago, and Boston were likewise the centers of high-priced areas, while in such areas as Kansas City, St. Louis, and Philadelphia prices had risen from approximately $3,000 to about $7,000.

LABOR COSTS

Construction wages followed the general trend higher, and construction labor costs rose even more because labor produced less than formerly. In many cases, this was not due to any uncooperative attitude, but rather to such troubles as lack of experienced mechanics, delays in delivery of materials, age of workmen, etc. In some quarters, there was determined effort to get apprentice-training programs under way. Notable was the case of the bricklayers; in this trade nearly 8,200 veterans and other young men were registered in the apprentice brick mason program, in 329 localities, according to the Structural Clay Products Institute. The program was operating in 43 states, yet at the end of the year one of the country's important industrial construction firms was conducting considerable research, at great expenditure of time and money, to find a substitute for brick as an industrial wall material because, even with all materials at hand, their masons were so elderly they could not handle brick speedily, and because their masons were being offered, by competing firms, wages substantially higher than they could afford.

QUALITY OF DESIGN

The trend away from traditional and eclectic architecture began to be manifest in many parts of the country, for many types of buildings. The rationality of the new approach to architectural design had not previously been unacceptable in such buildings as commercial office structures, factories, and research buildings; but there were fewer examples of houses, institutional buildings, and public buildings in the modern idiom. Where it had been accepted it had demonstrated its efficiency and its—usually—lower cost. Mounting construction costs may account for its greater acceptance during 1947, though that is also undoubtedly due in part to the large number of younger, more energetic individuals who have established themselves in practice since the war, and who are unwilling to design in the traditional manner. Another factor, more specialized yet quite significant in its effect, was the action of the Veterans' Administration in awarding design contracts for its new hospitals to many excellent architects, all of whom preferred the fresh approach to the traditional.

Whatever the reason, good contemporary design was to be found in every state; "modern" architects were practicing in Maine, in New Hampshire, in Vermont, in up-state New York, in Minnesota, South Dakota, Kansas, Virginia, Louisiana, Tennessee, Massachusetts, California, Oregon, Texas, and many other localities—often in smaller communities as well as in the larger metropolitan centers. The architects concerned were uniformly serious, technically competent, and often brilliant.

The annual Awards for excellence in design given by the magazine, *Progressive Architecture,* reflect this trend. Given in March for work built during 1946, the first awards for non-residential work went to the New Hampshire firm of E. H. and M. K. Hunter—young and just established—for their roadside showroom and restaurant for the Dewey woolen mills, in Queechee, Vt.; also to Ernest J. Kump of California for a school in San Carlos. Kump has been longer established, but his work has a similar character. In the residential class, houses by Gordon Drake and Kenneth Lind, both of Los Angeles, won awards; both these men are new to the field, and both the houses were "modern."

REPRESENTATIVE WORK OF THE YEAR

Work published during the year in the architectural press generally was of a similar nature. Completed works include various civic and county buildings as well as several houses, all in Klamath Falls, Ore., by Sheldon Brumbaugh; the Wayne County Health Center in Michigan, by Eberle Smith; Saarinen and Swanson's Opera Shed in the Berkshire Hills in Massachusetts, one of the finest structures acoustically and architecturally that was ever dedicated to music; the luxurious Tennis Club at Palm Springs, Calif., by Paul Williams and Quincy Jones; the Keeley Institute Dormitory at Dwight, Illinois, by Schweikher and Elting; the Blood Bank Building in Seattle, by Naramore, Bain, Brady, and Johanson; a wooden-arched factory for Mercury Aircraft at Hammondsport, N. Y., by Ervay Baker; another factory for the H. K. Porter Co., Somerville, Mass., Walter F. Bogner, Archt.; and numerous stores by the firm of Ketchum, Giná, and Sharp. Projected work, not yet executed, but published, showed even further development; there were a Jewish temple and school for Cleveland and a synagogue to be built near St. Louis, Mo., designed by Eric Mendelsohn; the tremendous North Shore Shopping Center for Beverly, Mass., which was expected to alter the shopping habits of a good proportion of metropolitan Boston's population, by Ketchum, Giná, and Sharp and several consultants; and office buildings of aluminum and glass in Philadelphia; by Friedman, Alschuler, and Sincere, and in Portland, Ore., by Pietro Belluschi. The Tishman Building on Park Avenue in New York City, by Kahn and Jacobs, attracted much attention because its exterior walls were somewhat cantilevered from columns set well inside the building's face. Frank Lloyd Wright's design for the Museum of Non-Objective Art, based on a logarithmic spiral larger at the top than at the bottom, was projected for the same city.

OUTSTANDING HOUSES

Houses which attracted interest during the year included: two by Gordon Drake, in Los Angeles; the radiant-heated Davies house near Chicago, by George Fred Keck; Edwin G. Johnson's house for himself in Cambridge, Mass.; houses designed around the peacetime version of the Quonset hut, in California, by John Campbell and Worley K. Wong; the Powell house, Forestville, Va., Charles M. Goodman, Archt.; a house in Minneapolis by Elizabeth and Winston Close; others in Princeton, N. J., by Kenneth Kassler, in Lincoln, Mass., by Carl Koch, and cottages in West Dennis, Mass., by David Fried; and the large, expensive, argument-provoking Geller house on Long Island by Marcel Breuer.

STUYVESANT TOWN IN NEW YORK

New York had two of the most provocative developments. One was Stuyvesant Town, the huge (75 acre) housing redevelopment undertaken by the Metropolitan Life Insurance Co., for which Gilmore D. Clark was Chairman of the Board of Design. Housing professionals almost to a man deplored the great density of population, the lack of schools, stores, and other amenities; architects were apathetic toward it. It was certainly the largest flowering of New York State's redevelopment law.

PROPOSED UN BUILDINGS

The other was the proposed buildings for the United Nations. John D. Rockefeller donated to the United Nations the site, several blocks in the slum areas of east-side New York which had been assembled by one of the country's largest real estate operators. Though there had been much agitation in the architectural press, here and in Europe, for an architectural competition to produce the best design for a world capital of which the world's architects were capable, Wallace K. Harrison of New York, who had been identified with some of the earlier negotiations, was selected as Director of Planning. Harrison is well known for his work in the design of Rockefeller Center in New York. He assembled a group of architects from other countries, including Le Corbusier from France, Oscar Niemeyer from Brazil, Howard Robertson from Great Britain, and several others, to work out preliminary schemes. These were widely published in the daily papers and news magazines in this country, less fully in the architectural magazines; it is too early to assess public reaction to the designs.

REPLANNING OF DOWNTOWN PITTSBURGH

In the field of city planning, the most noteworthy development was the comprehensive scheme for replanning and gradual rebuilding of downtown Pittsburgh, for which Mitchell and Ritchey of that city were the architects. Unlike many such schemes, this seemed to have a good chance for ultimate success since it was backed by reputable local citizens, organizations, and the city government, all of whom realized that Pittsburgh could not have a very rosy future if it should continue as an incipient industrial slum overlaid with smog.

THE THEATRE

By Edwin T. Duffy
News Department, *The New York Times*

INTERNATIONAL ASPECT OF THE 1947 SEASON

The second post-war theatrical season in America's leading showcase was an exciting and, generally speaking, rewarding one for followers of the spoken drama. The year was marked by an interchange of actors and plays between this country and Great Britain. America dispatched facsimilies of the long-running "Oklahoma!," as well as "Annie Get Your Gun," "Born Yesterday," and "Anna Lucasta." Britain, in turn, sent us a diverse set of actors and productions, some not up to the level of what we had come to expect, but all aiding in making New York's theatrical scene truly international in flavor.

The year 1947 saw the arrival of the Donald Wolfit Repertory Company for an engagement in New York. Braving this side of the Atlantic so hard on the heels of London's Old Vic Company proved disastrous, for too much was expected of them and too little was received. Wolfit was a competent actor and, in his production of "Volpone," proved to be a very good one. In the other offerings, "King Lear," "The Merchant of Venice," "As You Like It," and "Hamlet" he was not up to par, nor were the members of his supporting company. The group left town after three weeks' performances with a promise to come back in 1948. Also slated for appearances in the near future are the world-famous Abbey Theatre of Dublin (Sara Allgood, incidentally has consented to rejoin the ranks for the New York run) and Palestine's well-known Habimah Theatre, which is being brought over to this country by Theatre, Inc.

Completing the international aura for 1947 was the arrival of the celebrated D'Oyly Carte Opera Company of London which had not been seen on these shores since the dark days of 1939. The visitors were once again given a hearty welcome and their program of such Gilbert and Sullivan operetta favorites as "Patience," "The Mikado," "Iolanthe," and the rest was expected to keep them active well into 1948. For the records, their opening performance of "The Mikado" was the final spurt of theatrical production for 1947.

AMERICAN REPERTORY THEATRE

The year 1947 also saw what was claimed to be the temporary demise of the American Repertory Theatre, which had started operating only a year before. Shortly after the turn of the year, the organization ran into financial difficulties and decided to drop the repertory idea entirely in favor of regular-run revivals of "Yellow Jack," never a successful commercial play, and "Alice in Wonderland." The former lasted a little under three weeks, playing to sparse attendance at every performance, while the latter ran at a loss for a period of several months despite moderately good business. The upkeep for "Alice," coupled with theatre rentals and salaries for a large crew of stagehands, among other items, made it impossible for the production to operate in the black. The revival of "Yellow Jack" was staged by Martin Ritt and had a cast headed by Victor Jory and Raymond Greenleaf. Notices for the play were mixed and public attention waned. "Alice in Wonderland" was elaborately, albeit incoherently, revived with a former ballerina, Bambi Linn, in the starring role. Miss Linn, at least to this observer, seemed thoroughly unsuited for her assignment. As a matter of fact, the acting, in general, was so poor that even the grotesque overplaying Eva Le Gallienne and Margaret Webster, as the White and Red Chess Queens, proved something of a relief. Reports have been rife since the company's final offering that further productions are in the offing, and Miss Le Gallienne is said to be pondering the idea of reviving "Hedda Gabler" with herself in the title role.

OTHER REPERTORY OFFERINGS

Mid-summer marked another attempt at repertory in New York. A unit, known as The Company of Twelve, banded together to offer a season of revivals. Their initial, and final venture, was a mildewed production of the hardy perennial, "Rip Van Winkle." The press drew blood the following day and The Company of Twelve almost immediately closed up shop.

The City Center of Music and Drama promises to be the scene of some excitement in the repertory style early in 1948 when The New York City Theater Company begins what, according to reports, will be the first of its regular seasons of revivals. "Volpone," "Angel Street," and four one-act comedies by Chekhov have already been lined up, and the top players in the contingent, José Ferrer, Uta Hagen, Richard Whorf, and Le Roi Operti, are all uncommonly interesting performers. But the story of the new repertory group will be part of 1948's theatrical history.

END OF "LIFE WITH FATHER"

The only major milestone recorded in the year's theater scene was the interment of "Life with Father," which gave its final performance at the Alvin Theater one night last summer after having become the longest-running play in American theatrical history.

GIELGUD REVIVALS

The revival trend continued apace, although not at the break-neck speed that marked the 1946 season. John Gielgud and a cast of superior players, topped by Margaret Rutherford, Pamela Brown, and Jane Baxter, joined hands to give an engaging performance of the Oscar Wilde romp, "The Importance of Being Earnest," and, later in the year, Gielgud and fellow members staged a revival of Congreve's Restoration comedy, "Love for Love." Both were well-received by the press and public response was immediate. Gielgud next was concerned with the directorial chores of "Medea," Robinson Jeffers' freely adapted version of the Euripedes original. "Medea" was a happy occasion for it brought Judith Anderson back to her natural medium—the theater. As the stormy heroine of the classic Greek drama, Miss Anderson gave a performance that took the town by storm, and Gielgud as her erring husband and Florence Reed as her nurse gave commendable support.

Gielgud left the cast of "Medea" to take over the starring role in Rodney Ackland's adaptation of Dostoyevsky's "Crime and Punishment." The production was directed by Theodore Komisarjevsky, and once again Gielgud gave an outstanding performance. Also in "Crime and Punishment," Lillian Gish returned to the stage after a lengthy absence to remind older theatregoers that she remains one of the theatre's most gifted players. Supporting the star and Miss Gish were Vladimar Sokoloff and Dolly Haas, who made an appealing appearance in "Lute Song" a season or two back.

KATHARINE CORNELL

Katharine Cornell was responsible for the highly successful revival of the Shakespearean tragedy, "Antony and Cleopatra." The play has always been regarded as one of the Bard's masterpieces, but in its various productions in America, has always managed to come a-cropper. It took Miss Cornell to break the jinx, and she, along with Britain's Godfrey Tearle as Antony, provided theatregoers with one of the year's most brilliant evenings.

MAURICE EVANS

Maurice Evans, more usually concerned with Shakespeare, resorted to George Bernard Shaw's "Man and Superman" for his 1947 theatrical appearance. The transition from heavy drama to bantering comedy proved no obstacle for the versatile star, and, along with Frances Rowe, Jack Manning and Carmen Matthews, he placed the Shavian comedy high up on the list of the season's favorite attractions.

OPERETTA REVIVALS

Paul Stone, last represented by the 1946 revival of "The Red Mill," helped in presenting the 1915 operetta, "Sweethearts." The score by Victor Herbert did much to compensate for the shoddiness of the book revisions made by John Cecil Holm, which, in turn, were matched only by the shoddiness of the scenic production. The star of the occasion was Bobby Clark, but the venerable comedian found himself confronted with a tough situation, as did Marjorie Gateson, his leading lady. Nonetheless, "Sweethearts" found a public for itself and had achieved a full season's run before taking to the road.

The other operetta revival was Oscar Strauss' "The Chocolate Soldier," produced with little, if any, imagination by J. H. Del Bondio and Hans Bartsch. Although the music remained lovely as ever and benefited greatly by the presence of Frances McCann, a lovely new singer, luck was against the play from the start. Things were not aided materially by a comedian from the Hollywood hills, one Billy Gilbert, whose sole contribution to the evening's dubious hilarity was a succession of leers, grimaces, and preposterous sneezing fits. The production closed after only a moderate engagement.

OTHER REVIVALS

The year's remaining three revivals had all formerly served as vehicles for popular stars of a decade or two ago. The best of the lot was George Kelly's "Craig's Wife" with Judith Evelyn playing the role created by Crystal Hearne. It is always a pleasure to see an actress of Miss Evelyn's caliber at work on a stage and, if the revival, upon occasion, showed signs of age, it was no fault of hers. Philip Ober, Kathleen Comegys, Viola Roache, and Dortha Duckworth gave the star the very best in support, and Gant Gaither's physical production was most attractive to behold.

Jane Cowl came back to the theatre after an absence of several years to appear in "The First Mrs. Fraser," also produced by Gaither. The star role, played originally by Grace George, was interpreted by Miss Cowl with all the arch smiles, giggles, and raised eyebrows that have for so long been her trademark. Unfortunately, Miss Cowl's considerable list of mannerisms did little for the role and, what was worse, even less for the play. Henry Danniell, normally an excellent actor, was almost submerged in the thankless role of the dour husband.

The New Opera Company, heretofore associated solely with musical productions, finally came forth with its oft-postponed revival of "Topaze." Oscar Karlweis, the Continental comedian, was seen in the old Frank Morgan role, and Clarence Derwent was on hand to recreate his original role. The revival also served to introduce former dancer Tilly Losch to theater audiences. For all the good intentions that went into "Topaze," comparison with the 1930 production was inevitable, and the play closed immediately after its opening night.

DRAMAS

"The Druid Circle."—The year produced a small, but excellent, selection of dramas. Of the 14 set forth at various intervals, five were outstanding, and, of this number, four were commercially successful and were still running at the time this edition went to press. The exception was "The Druid Circle," John Van Druten's most interesting and intellectually stimulating play. "The Druid Circle" dealt with a hide-bound professor in a small Welsh town whose basic dislike for youth was unhappily reflected in his associations with the student body. The role of the professor was played, and brilliantly, by that able actor Leo G. Carroll and, as the old boy's crotchety mother, Ethel Griffies gave what amounted to the best supporting performance of the year. There also were fine pieces of acting from Boyd Crawford, Merle Maddern, and Neva Patterson, the latter being one of the most attractive newcomers in several seasons.

"All My Sons."—The year introduced a new and able playwright on the American theatre scene, Arthur Miller, who had been represented on Broadway only once before with a quick failure named "The Man Who Had All the Luck." Miller's second play, "All My Sons," was an outstanding production all along the line and was the recipient of the Critics' Prize for the best dramatic play of the year. The play, expertly directed by Elia Kazan, was also notable for its high quality of acting. Ed Begley, as a plane parts manufacturer who had knowingly shipped defective equipment overseas; Arthur Kennedy as his embittered son; Karl Malden, Lois Wheeler, and, in particular, Beth Merrill, in the difficult role of the tortured mother, gave performances the like of which are not often seen in our theatre.

"The Heiress," a play by Ruth and Augustus Goetz, and suggested by the Henry James novel, *Washington Square,* brought back to the stage the expert directorial abilities of Jed Harris and proved to be one of the most literate and exciting dramas of the year. It also was the occasion to renew acquaintance with the outstanding British actress, Wendy Hiller, not seen in this country since "Love on the Dole" in 1936. Miss Hiller gave an outstanding performance, and Basil Rathbone, Patricia Collinge, Betty Linley, and Peter Cookson were admirably adept in their roles.

"A Streetcar Named Desire."—Tennessee Williams, last represented locally by "The Glass Menagerie," was responsible for another glowing success, "A Streetcar Named Desire," which rapidly became the town's number one dramatic attraction. Elia Kazan directed this study of mental and moral disintegration in high order, and, in the central role, Jessica Tandy gave one of the top dramatic performances of the year. The supporting cast also was excellent and included such personalities as Marlon Brando, Karl Malden, Kim Hunter, and Nick Dennis.

"The Winslow Boy."—Terrence Rattigan's "The Winslow Boy," which had been a huge success in London, was imported for a New York run with its original cast and production intact. The play, based on an actual incident in British history, dealt with the fight of a father to have his son reinstated at a naval academy after the youth had been falsely discharged for theft. The drama, well-staged by Glen Byam Shaw, embraced the services of a good acting company, including Alan Webb, Frank Allenby, Michael Newell, and Valerie White.

"Command Decision."—The final drama of merit for the year was William Wister Haines' "Command Decision." While this war drama was thoroughly uneven in its writing, it avoided many of the pitfalls and cliches of the average play of this type. Paul Kelly, in the leading role, was excellent, and Jay Fassett gave an amusing performance as a brigadier general.

DRAMATIC FAILURES

With the good must come the bad, and some of the year's bad dramatic plays were really frightful. Hugh White's "Little A" was an old-hat drama of the "Hedda Gabler" school, and, in it, Otto Kruger and Jessie Royce Landis gave performances right out of "ten-twent-thirt" melodrama.

John Patrick, who had found an audience only a season or two back with "The Hasty Heart," came forth with "The Story of Mary Surratt," memorable only for the acting performance of Dorothy Gish, as the woman implicated in the assassination of President Lincoln.

Ronald Duncan's adaptation of Jean Cocteau's "The Eagle Has Two Heads" was preposterous make-believe, made even worse by the incredibly bad acting performances of Tallulah Bankhead, Clarence Derwent, and Helmut Dantine, a Hollywood screen figure.

Two good actresses, Miriam Hopkins and Mady Christians, were unwittingly caught up in James Parrish's "Message for Margaret," still another reworking of the eternal triangle theme. Elliot Nugent staged the offering, which drew a drubbing from the critics and withdrew after only five performances.

The remaining dramatic failures for the year were Jan de Hartog's "This Time Tomorrow," with John Archer and Ruth Ford; Dorothy Gardiner's romance of Emily Dickinson, "Eastward in Eden"; Robinson Jeffers' dramatic poem "Dear Judas" and Ferenc Molnar's "Miracle in the Mountains" which gave Julie Haydon and Victor Kilian work for only three performances.

COMEDIES

"John Loves Mary."—It was a bad year for comedy. Of the 15 specimens of that type to put in an appearance, only one was thoroughly acceptable. That was Norman Krasna's "John Loves Mary," basically a thin rewriting of the romantic complications school, but handled, at least, in a manner that was showmanly and professional. In it, Tom Ewell, who has been playing around these parts for a number of years, was acclaimed as the season's most promising new comedian. Also amusing in a uniformly good cast were William Prince as the John of the play's title, Harry Bannister, Loring Smith, and Lyle Bettger. The Mary of Nina Foch, however, was a disappointment.

"A Young Man's Fancy," an alleged comedy by Alfred Golden and Harry Thurschwell, drew a barrage of brickbats from the local play reviewers, but producer Henry Adrian's determination has kept this nonsense about life in a children's summer camp alive for far longer than it is worth. It still is continuing, though to negligible financial results.

"How I Wonder."—Donald Ogden Stewart, absent from Broadway for 15 years, returned from his arduous labor in the Hollywood vineyards, with what he chose to call a comedy. The vehicle, "How I Wonder" proved to be anything but a comedy as such weighty topics as the possibility of a third World War and the threat of atomic warfare served as typical examples of the conversation. Stewart, by attempting to cover a dozen themes at once, thus found himself in the embarrassing position of never having covered one thoroughly. Raymond Massey, considerably out of his depth, played a small-town college professor in a style more generally associated with Abe Lincoln. Carol Goodner, giving a good performance, as always, brought a certain amount of feeling to the badly written role of the professor's wife. The balance of the cast, and Everett Sloane, in particular, were entirely equal to the unhappy proceedings.

"Under the Counter."—Another comedy disappointment was the British-imported comedy "Under the Counter," which was used to reintroduce the dynamic English comedienne, Cicely Courtneidge. Miss Courtneidge, a hearty, amusing performer, worked like the proverbial Trojan to save a typical British music-hall offering, but even her vigor could not keep "Under the Counter" running for more than a few weeks.

"Open House."—Another delightful comedienne, Mary Boland, made a brief appearance in a rubbishy comedy called "Open House," naturally enough, dealing with the housing shortage. But the bricks in Miss Boland's house were made of straw, and the structure toppled within a week. Another effort dealing with the housing shortage, and even worse than "Open House" since it had no Mary Boland in its cast, was "Tenting Tonight," in which a harried cast did their best to overcome an impossible script. "Tenting Tonight," like the Arab, quickly folded its tent and silently crept away to Cain's.

OTHER COMEDIES

For the rest, British screen star James Mason made a fleeting appearance in Jacques Deval's "Bathsheba"; Howard Smith and Le Roi Operti worked hard to save a stagnant comedy known as "The Magic Touch"; Anthony Quinn, of the films, made a pleasing stage debut in Emmet Lavery's "The Gentleman from Athens"; Martha Scott was trapped for seven performances in "It Takes Two," still another piece of nausea dealing with the shortage in living quarters; Claire Trevor and Philip Dorn, two more refugees from the Hollywood studios, braved New York in "The Big Two" and went right back where they came from; Walter Abel and Edith Atwater had a fling at William McCleery's thin, but occasionally amusing, "Parlor Story"; Joseph Buloff, complete with accent, kept "The Whole World Over," a comedy dealing with the Soviet housing shortage for a blessed change, running for all of 100 performances; David Burns, remembered from "The Man Who Came to Dinner," appeared in a racetrack fable called "I Gotta Get Out" (it did) and the story of lady war correspondents was given a brief whirl in 1947's first offering, "Love Goes to Press."

One other comedy, not a failure but a moderate success, is worthy of mention. That was F. Hugh Herbert's "For Love or Money," singled out, not for any particular merit in the writing, but for the delightful stage debut of June Lockhart, daughter of that able acting team, Kathleen and Gene Lockhart. While critical response to the play was cool, gentlemen of the press unanimously hailed Miss Lockhart as the ingenue find of the year. Vicki Cummings and John Loder, in other stellar roles, were more than adequate, but it was agreed that it was Miss Lockhart that kept the play popular at the box-office.

FARCE FAILURES

For the records, two farces turned up during the year. The first, "Heads or Tails," was the handiwork of two literary gentlemen known as H. J. Lengsfelder and Ervin Drake, and was presented by an organization called Your Theatre, Inc., which gave the public the intriguing opportunity of being allowed to invest in theatrical production. It will be the work of some other worthy to determine the number of people who poured money into this losing venture. "Heads or Tails" closed rapidly and nothing has been heard since of the organization. The "angels," apparently, have learned their lesson.

The year's other farce was an item known as "Trial Honeymoon," and the "catch" title proved sufficient to keep the populace away from the box-office tills in droves. It lasted for eight consecutive performances.

MUSICAL DRAMAS—"STREET SCENE"

The year 1947 went down in theatrical records as the year in which the Broadway stage struck out for something new and exciting in musical entertainment.

The first major stride was taken with the production of Elmer Rice's prize-winning "Street Scene." Although labeled "a dramatic musical" by its producers, Dwight Deere Wiman and The Playwrights' Company, it actually adhered more to the standards of opera, since only a few pages of spoken dialogue were to be found in the script. Opera, dramatic musical or what-have-you, "Street Scene" was the year's finest offering in any field. The natural color and superb quality of the Rice text lent itself most adroitly to Kurt Weill's fine music and Langston Hughes' soaring lyrics. It was produced by people with a love for the theatre and was, in the opinion of many, the year's most important achievement. In it, Polyna Stoska, with a voice of genuine beauty, was introduced to theatregoers and, upon "Street Scene's" closing, she was immediately snared by the Metropolitan Opera Association. Miss Stoska sang the role of the errant wife, while Anne Jeffreys, with a fine and promising lyric soprano, appeared as her daughter. Norman Cordon, another good singer, was impressive as the father, and there were fine singing-acting contributions from Brian Sullivan, Hope Emerson, and Sydney Raynor. The music, combined with superior lighting and stage scenery, all joined together to present a thrilling tone poem of life in New York City.

"THE MEDIUM" AND "THE TELEPHONE"

The other big musical event for 1947 was the double-bill comprised of "The Medium" and "The Telephone." The productions contained book, lyrics, music, and direction by the gifted Gian-Carlo Menotti, who introduced a fresh talent to the Broadway musical stage. "The Medium" was a gripping chamber opera which told the story of a sham seeress who is actually visited by a supernatural force and whose reason becomes unbalanced. Spun out in two acts, "The Medium" presented Marie Powers in the title role, and she proved superb at both singing and acting. Miss Powers was superbly supported by Evelyn Keller as the medium's daughter and Leo Coleman as a mute servant. "The Telephone," a brief curtain-raiser, brought along Marilyn Cotlow, the possessor of a charming soprano in an amusing bit of whimsy dedicated to a young female's addiction to that instrument. Both chamber operas represented a fine blend of music, drama, and singing. Favorable press reception was almost unanimous, but, for a time, it looked as if the productions were doomed to failure. Several closing notices were posted but each time were abandoned when public interest strengthened. Both "The Medium" and "The Telephone" had chalked up a comfortable run of six months before taking to the road for an extensive tour.

MUSICALS, REVUES, OPERETTAS, VARIETY

"Brigadoon."—Even the more usual Broadway musical product took a turn for the better during the course of the year. "Brigadoon," a musical fantasy with an interesting book by Allan Jay Lerner and fine lyrics and music by Lerner and Frederick Loewe, was the best new musical of the year. Set in Scotland, "Brigadoon" was the story of a tiny enchanted village which came to life once every 100 years. Marion Bell, the singing heroine, was delightful and David Brooks excellent as the leading man. The production received the Critics' Prize as the best new musical of 1947 and is still continuing to capacity audiences.

"Finian's Rainbow."—A second musical fantasy to delight theatregoers was "Finian's Rainbow," a pleasant tale of an Irish immigrant and his daughter who come to America with a stolen pot of gold and run into a series of amusing mis-adventures in the mythical southern state of Missitucky. Embellished with a book by E. Y. Harburg and Fred Saidy and boasting lyrics by Harburg and music by Burton Lane, a first-rate cast, including Albert Sharpe and Ella Logan, soon placed "Finian's Rainbow" high up on the list of top musicals for the year.

"Allegro."—A new production from Richard Rodgers and Oscar Hammerstein II also marked the year's theatrical activities. "Allegro," which as usual had Agnes de Mille's choreographic imprint, proved something of a disappointment to the "Oklahoma!" and "Carousel" admirers. Tracing the history of an American doctor from the time of his birth to his death, "Allegro," in the opinion of this observer, took itself far too seriously a great deal of the time, and, while its principal players, including Annamary Dickey, John Conte, Muriel O'Malley, and John Battles, all worked well, the production was just not up to the high level of excellence expected from The Theatre Guild and the Messrs. Rodgers and Hammerstein. A high-pressure publicity campaign, in advance of the opening, convinced the play-going public that "Allegro" was something to see. It is still running and to the tune of almost $50,000 weekly.

"High Button Shoes."—The more ordinary style of Broadway musical was represented by "High Button Shoes." The production, good-natured and amusing, had Phil Silvers as its principal comedian, and let it be said that Silvers never once allowed the customers to take things seriously. Nanette Fabray made a bright appearance as the show's heroine, and Jerome Robbins submitted a hilarious "Mack Sennett Ballet," which became the highlight of the offering. "High Button Shoes" is still continuing to make friends at the box-office and a prosperous engagement is in sight.

"Barefoot Boy with Cheek."—The year's remaining musical comedy offerings, however, were nothing to get excited about. "Barefoot Boy with Cheek" was based on the book by Max Shulman and its stage version's sole claim to distinction of any kind was, probably, the most uninspired set of music and lyrics to appear in any musical for a number of years. Working against George Abbott's frenzied direction and a thoroughly unamusing script, even Nancy Walker found it impossible to be amusing. After putting up an impressive publicity front, "Barefoot Boy" called it quits, with the accompanying heavy financial loss.

"Angel in the Wings."—The year's only revue was "Angel in the Wings," which was used as an amusing vehicle for the talents of The Hartmans, an amusing new comedian, Hank Ladd, Elaine Stritch and Viola Roache. Successful revues have become increasingly difficult to find, so it was with no small amount of pleasure that the town's critics found the new one very much to their taste. Opening towards the end of 1947 and receiving generally good notices, "Angel in the Wings" seemed sure of running well on into 1948.

"Music in My Heart" was 1947's sole new operetta and, unfortunately, not much good. Based fleetingly on alleged incidents in the life of Tchaikovsky, the production proved popular at the box-office for a while, but, before the year was out, attendance had slumped, and a precautionary closing notice had gone up backstage. The cast included Robert Carroll, Martha Wright, and Vivienne Segal.

Chevalier and Piaf.—Other musical items for the year 1947 included special engagements of the French entertainers Maurice Chevalier and Edith Piaf, the former in a one-man show and the latter in a French variety program, in which the diminutive singer was supported by a hilarious group of singing comedians known as "Les Compagnons de la Chanson."

"The Cradle Will Rock."—Marc Blitzstein's play in music, "The Cradle Will Rock" was transplanted to Broadway's Mansfield Theatre after two successful evening performances at the City Center. A good deal of the sting of the labor operetta seemed to have been lost in the passage of time, and the latest production, which had cast members placed on the stage in three rows of chairs and stepping to the front of the platform to enact their parts, did not seem to be quite as intriguing as must have been originally thought. The Broadway production included Will Geer, Muriel Smith, Vivian Vance, and Alfred Drake.

MELODRAMAS

"An Inspector Calls."—The art of theatre melodrama remained almost entirely forgotten during 1947. J. B. Priestley, however, sent along an interesting, if quiet, study in suspense labeled "An Inspector Calls," which brought Thomas Mitchell back to Broadway. While this was not one of Priestley's best plays, it had its good moments and was particularly well-acted by Mitchell, Doris Lloyd, Renee Ray, Melville Cooper, and John Buckmaster.

"Portrait in Black" was an overwritten exercise in melodramatic mayhem crossed with violent sex angles. In it, Claire Luce, after a considerable London success, returned to America to give a curiously stilted performance as the play's unhappy heroine. She was supported in routine style by Sidney Blackmer and Donald Cook. The play managed a few months on the two-for-one ticket basis, but even this concession was unable to keep the show running.

OTHER ITEMS

Charles Laughton, lost to motion pictures for a number of years, consented to come back to town for a limited engagement in the Experimental Theatre's off-Broadway production of the Bertold Brecht play "Galileo," as translated into English by Laughton. The star was supported by John Carradine, Wesley Addey, and Joan McCracken. Other Experimental Theatre productions for 1947 included John Finch's "The Wanhope Building"; John Savacol and Glendon Swarthout's "O'Daniel"; Tillman Breiseth's "As We Forgive Our Debtors"; Arnold Sundgaard's "The Great Campaign"; and John D. and Harriet Weaver's "Virginia Reel."

Just to keep the year's theatrical records intact, mention should once again be made of the fact that Ruth Draper, under the sponsorship of John C. Wilson, took up her customary stand at the Empire Theatre in a limited engagement of her well-known monodramas. Miss Draper was once again hailed by the critics and at a $3.60 top for performances was assured of a profitable run of several weeks.

MOTION PICTURES

By Thomas M. Pryor
Motion Picture Department, *The New York Times*

GENERAL

The American motion picture industry would like very much to forget that a year such as 1947 ever existed, but the events of the last 12 months were too momentous, economically and politically, to be quickly forgotten; and, indeed, at least two of the developments will be discussed again when the books are closed on 1948. For the business of making motion pictures in 1947 is being conditioned to a large extent by the effects of the tax imposed last August by the British Government on earnings of imported films, and also, on the cultural level, by the hearings of the House Committee Investigating un-American Activities.

HIGH EARNINGS OF THE INDUSTRY

Although as 1947 got under way, box-office receipts were erratic when not showing definite signs of decline, there was a marked improvement in picture grosses from about June on, and the industry was thus able to chalk up another banner year. On the basis of Federal admission tax payments through October 1947, theatre box-office receipts for the year were estimated at more than $1,500,000,000, or roughly about only one per cent less than the all-time record income of $1,562,179,235 achieved in 1946.

Perhaps the most significant thing about the `phenomenal earnings is that the quality of pictures released in 1947 was decidedly mediocre. Indicative of the lack of creative ingenuity displayed on the screen was the return to shortened runs for pictures in theatres throughout the country. For example, Broadway first-run houses, which had become accustomed to extended runs, were frequently changing programs at intervals of two to three weeks. While the aggregate gross business for the nation's 16,000-plus movie houses would seem to dispel fears of an imminent recession, the fact remains that individual pictures did extremely poor business, thereby strengthening the impression that the public is shopping now more than ever and no longer is willing to pay a dollar or more for entertainment that is worth not more than 25 cents.

BRITISH TAX FACTOR

When it became apparent that there was no way of staying or compromising the 75 per cent tax levied by the British government on the earnings in England of imported pictures, particularly American films, since they constituted about 80 per cent of the movies shown on English theatre screens, the American industry immediately canceled further shipments of films to England. As the year ended negotiations were begun to settle this impasse, but prospects of an early solution faded after an initial burst of optimism, and Hollywood studios lost no time in preparing themselves to face the loss of an estimated annual net profit of $68,000,000 from the British market.

The tax measure, introduced to help Britain ease her desperate dollar shortage, was not popularly received by the English movie interests, especially theatre owners. No ill effects were felt during 1947, however, as there was a sufficient stockpile of new and tax exempt American films in the country when the regulation and the counter embargo were announced in August. However, that supply was not expected to last beyond March 1948, and, therefore, British theatre owners could not observe the dawn of a new year with customary enthusiasm. And, Hollywood's initial bullishness was diminished somewhat by hints from observers in England that steps might be taken to lift the exemption enjoyed by those films stored in London vaults before the deadline.

One immediate effect of the loss of this revenue on Hollywood was the cancellation of several projected high budget productions, and the redrawing of plans for additional pictures. Under this trimming of budgets, the $2,000,000 picture will be the exception rather than the rule through 1948, at least. For now Hollywood is operating on the sensible economic premise of earning a profit in the domestic market and writing off foreign revenues as pure gravy. Heretofore, producers often started pictures on budgets so high that they knew in advance that, unless the picture was another "Gone with the Wind," it would be lucky to pay back its dollar investment from showings in this country. That was the principal reason why the foreign market became so all important to the financial well-being of the American movie industry.

REPERCUSSION IN HOLLYWOOD

The panic which gripped Hollywood at the realization of the great loss in earnings from England, resulted in wholesale dismissals by the major studios of low salaried employees. The firings took place among workers in the home offices of the companies in New York and in exchange centers around the country as well. Some of the studio workers were given payless "vacations" of more than a month as the studios shutdown to realign production schedules. The economy wave did not have such serious consequences for the five and six figure earning group, including stars, featured players, writers, directors, and producers, because most of them had contracts. However, several found themselves at liberty upon expiration of their commitments, and every sign indicated that when new contracts were negotiated their earnings would be readjusted downward.

The morale of the industry's employees was, however, seriously affected by the inequity with which the economy program was administered. There were many instances where employees with service records of ten years or more, suddenly found themselves possessing pink dismissal slips. At least, one of the big companies, Metro-Goldwyn-Mayer, found itself in the contradictory and embarrassing position of having fired porters, charwomen, and messengers on grounds of economy and then having handed out bonuses running into thousands of dollars each in the case of its high salaried executives. Though no exact figures were available on the number of persons who lost jobs as a result of the economy, firings were known to be in excess of 1,000 employees.

CONGRESS COMMUNIST PROBE

In its time, the motion picture industry has been the target of many and diverse probes, official and otherwise, but it goes without saying almost that nothing ever frightened the industry as much as the Communist probe undertaken by the House Committee Investigating Un-American Activities. Not even the "war-mongering" Senate investigation of 1941 shook the leaders of the industry and created hysteria anywhere near as apparent as the hearings conducted in Washington by J. Parnell Thomas, Republican Representative from New Jersey and chairman of the House Committee.

Sensational charges that the screen was being abused as a medium for communist propaganda and that pictures were literally dripping with Red sentiment were alleged by Representative Thomas and others. However, at the time the hearings were adjourned late in the year not one shred of evidence had been introduced to substantiate the charge that Moscow was dictating the ideological content of American motion pictures.

The issue of Communist propaganda on the screen soon became sidetracked at the hearings, and Representative Thomas turned his guns, with generous help from some of the biggest stars, directors, and producers in Hollywood, upon exposing alleged communist party members and/or fellow travelers who held creative positions of responsibility in the industry. The Screen Writers Guild was recklessly branded as a Communist organization, but when the showdown came none of those who pointed the finger could produce clear cut evidence to substantiate their allegations.

Ten individuals who refused to answer "yes" or "no" to assertions of the Committee regarding alleged membership in the communist party on grounds that such questions were a violation of Constitutional guarantees, were, however, cited by Congress for contempt and summarily dismissed by their studios. Those charged with contempt were writers Dalton Trumbo, Ring Lardner, Jr., Lester Cole, John Howard Lawson, Albert Maltz, Alva Bessie, Samuel Ornitz, and Herman Biberman and producer Adrian Scott and Director Edward Dmytryk.

Alarmed by the public furor occasioned by the investigation, and prodded by banking interests quickly to undertake to reestablish public confidence in the motion picture industry as an untarnished and glittering example of American enterprise, the Motion Picture Association announced that the industry would not knowingly hire, or continue to keep in its employ, anyone who was a communist. And Congress was called upon to enact legislation to help all American industry "rid itself of subversive, disloyal elements."

The action of the MPA was unprecedented in American industrial fields. Though Eric Johnston, president of the MPA, sought to assure Hollywood's creative talent that the industry was not embarking on a witch-hunt, his assertion that the new policy was "not going to be swayed by hysteria or intimidation," did little to still fears. Rumors of a secret blacklist by studio executives immediately spread and reached such proportions that even the solid conservatives in Hollywood began to feel uneasy. All of this uncertainty, it is argued by the writers and directors, and even admitted by studio heads, can not fail to exert an adverse influence upon the content of screen plays. It is regarded as highly unlikely that writers will dare to tackle themes with social significance, for instance, during the year 1948.

MPA'S DECLARATION OF POLICY

Because of its importance at this time, and because it may be the forerunner of legislation affecting the individual's right to full employment because of political affiliation or belief, it might be well to put into this record the text of the Motion Picture Association's declaration of policy. The document, issued on Nov. 25, follows:

"Members of the Association of Motion Picture Producers (that's the Hollywood arm of the Motion Picture Association—ed. note) deplore the action of the ten Hollywood men who have been cited for contempt of the House of Representatives. We do not desire to prejudge their legal rights, but their actions have been a disservice to their employers and have impaired their usefulness to the industry.

"We will forthwith discharge or suspend without compensation those in our employ, and we will not reemploy any of the ten until such time as he is acquitted or has purged himself of contempt and declares under oath that he is not a Communist.

"On the broader issue of alleged subversive and disloyal elements in Hollywood, our members are likewise prepared to take positive action. We will not knowingly employ a Communist or a member of any party or group which advocates the overthrow of the Government of the United

States by force or by any illegal or unconstitutional methods.

"In pursuing this policy, we are not going to be swayed by hysteria or intimidation from any source. We are frank to recognize that such a policy involves dangers and risks. There is the danger of hurting innocent people. There is the risk of creating an atmosphere of fear. Creative work at its best can not be carried on in an atmosphere of fear. We will guard against this danger, this risk, this fear.

"To this end we will invite the Hollywood talent guilds to work with us to eliminate any subversives; to protect the innocent; and to safeguard free speech and a free screen wherever threatened.

"The absence of a national policy, established by Congress with respect to the employment of Communists in private industry, makes our task difficult. Ours is a nation of laws. We request Congress to enact legislation to assist American industry to rid itself of subversive, disloyal elements.

"Nothing subversive or un-American has appeared on the screen. Nor can any number of Hollywood investigations obscure the patriotic services of the 30,000 loyal Americans employed in Hollywood who have given our Government invaluable aid in war and peace."

The next rounds are due this year when the House Committee resumes its hearings in Washington; the ten cited for contempt come before the court, and the legal responsibility of the companies which dismissed the ten, notwithstanding contractual commitments, is tested in court actions.

LABOR RELATIONS

In the excitement over the investigation and the British tax, small attention was given the fact that the International Alliance of Theatrical Stage Employees emerged victorious, by default, in its long drawnout and bloody jurisdictional strife with the Conference of Studio Unions. As the year drew to an end, the once mighty CSU informally admitted defeat by permitting its members to cross picket lines without prejudice and seek employment in the studios. Labor observers, taking a long view of the IATSE's current position, believe that it is stronger now than ever and also has the producers, friendly disposed to the union during the conflict, at its complete mercy in the event of future labor-employer conflict. For now the studios have no rival union to turn to for aid in the event of trouble.

PICTURES WITH SOCIAL THEMES

Only three pictures of any great social consequence came out of Hollywood during the year. These were "Gentleman's Agreement," produced by Twentieth Century-Fox, and "Crossfire," produced by RKO Radio Pictures, both of which dealt frankly with anti-Semitism in the United States, and "The Fugitive," a strong declaration for religious tolerance, directed by John Ford and released for Argosy Pictures—the Ford-Meriam C. Cooper Company—by RKO. "Gentleman's Agreement," which received the New York Film Critics award as the best picture of 1947, was the more thoughtful treatment of anti-Semitism. The subject was used for more muscular melodramatic purpose in "Crossfire," which revolved around the killing of a Jew by a recently discharged American Army soldier.

FOREIGN FILMS

In selecting the best film of the year, the New York Critics had a difficult time, however, arriving at their decision, for it was not until the sixth ballot had been cast that "Gentleman's Agreement" won with nine votes to seven for the expertly made British picturization of Charles Dickens' "Great Expectations." The New York Critics gave their best foreign picture award to the Italian production "To Live in Peace." Another Italian film, "Shoe Shine" also figured in the voting as did two exceptionally interesting French films, "Children of Paradise" and "Panic."

AWARDS

The New York Film Critics gave their accolade for the best direction to Elia Kazan for "Gentleman's Agreement" and "Boomerang"; their best actor award to William Powell for "Life with Father" and "The Senator Was Indiscreet" and their best actress award to the British star, Deborah Kerr, for her English films "Black Narcissus" and "The Adventuress." The critics specifically did not consider her performance in her first Hollywood-made film, Metro-Goldwyn-Mayer's "The Hucksters," as worthy of special attention.

TEN BEST PICTURES

Bosley Crowther, motion picture critic for *The New York Times*, included three foreign pictures among his selections of the year's ten best, the aforementioned "Shoe Shine," "To Live in Peace," and "Great Expectations." His pick of the Hollywood crop follows: "The Yearling," Metro-Goldwyn-Mayer; "Miracle on 34th Street," Twentieth Century-Fox; "Crossfire," RKO Radio Pictures; "Life with Father," Warner Brothers; "Gentleman's Agreement," Twentieth Century-Fox; "The Bishop's Wife," Samuel Goldwyn, and "The Fugitive," Argosy-RKO Radio Pictures.

CHARLES CHAPLIN

The National Board of Review of Motion Pictures surprised professional movie observers by giving its best picture award to Charlie Chaplin's "Monsieur Verdoux," a picture which was lukewarmly received by the New York press and which was a dismal failure in its Broadway engagement. Although the film itself was considerably more interesting and refreshing than a lot of others which did very well indeed at the box-office, the allegations of Communism and Communist sympathy leveled at Chaplin by various groups and publications during the year undoubtedly hurt the film's earning power.

BING CROSBY

Bing Crosby, on the basis of a poll conducted among the managers and owners of the nation's 16,000 movie houses, came out for the fourth consecutive year as the top money-making star, according to the trade publication *The Motion Picture Herald*. The only other star ever to hold that honor was Shirley Temple, who held the box-office leadership from 1935 through 1938. Running behind Crosby, the other nine top money-making champions were, in the order listed, Betty Grable, Ingrid Bergman, Gary Cooper, Humphrey Bogart, Bob Hope, Clark Gable, Gregory Peck, Claudette Colbert, and Alan Ladd.

CENSORSHIP PROBLEMS

Censorship problems continued to bedevil the movie makers in 1947, and indications of public resentment over immorality and brutality on the screen led the Johnston office, as the Motion Picture Association is informally called, to revise the Production Code and the Advertising Code in such a way as to bar specifically the filming of gangster stories in which criminality is made to appear attractive. Immorality also got some added and specific "don't's" to those already in both codes, and it is the industry's fond expectation that this regard for propriety will lessen attacks from the Roman Catholic and other church and lay groups.

Twentieth Century-Fox found itself in hot water not only with the Catholic Church but with civic groups and even motion picture theatre owners as a result of "Forever Amber." The Legion of Decency condemned the film on behalf of the Roman Catholic Church; Cardinal Spellman warned the laity of the Archdioceses of New York that they could not attend the film with a clear conscience, and Archbishop Dougherty in Philadelphia forbade his flock to attend film showings for one year at the Fox Theatre there after the management refused to heed his request to cancel the run of the picture. Later, after the Fox company made changes in the picture and added a foreword emphasizing the adage about the wages of sin, the Legion gave the picture a "B or objectionable in part" classification. The Legion also condemned the British picture "Black Narcissus," dealing with the ill-fated mission of a group of Protestant nuns in India, on the grounds that it cast unwarranted reflections on the religious. This film also received a better rating and was, in fact, given a "Class Two A or morally unobjectionable for adults" status after the producers made some alterations.

NEWSREELS

There was nothing worthwhile in the newsreel field to merit reviewing, as the only change here was one of management when the Warner Brothers bought control of Pathe News. Similarly there was no appreciable activity in the 16mm field outside of normal operations. The only happening of note in this regard was the deal whereby Louis de Rochemont, founder of The March of Time editorial newsreel technique and who later introduced the documentary style of picture making to Hollywood *via* "House on Ninety-Second Street," "13 Rue Madeleine," and "Boomerang," established a company, with financing from United World, to produce a series of 16mm classroom motion pictures. Mr. de Rochemont has outlined plans for a series of 86 subjects, providing an integrated course in world geography, but the first of these pictures will not be ready before late 1948.

DIVISION XXVII

EDUCATION

ELEMENTARY EDUCATION*

By W. Leslie Garnett
Professor, Kent State University
and
Ralph D. Purdy
Superintendent of Schools, Conneaut, O.

INTRODUCTION

The 1947 review of elementary education in the United States has been made from source materials. During the fall of 1947, a questionnaire was sent to all state superintendents of instruction requesting information pertinent to such a report as would be expected on the subject of elementary education. A gratifying response came almost immediately from about 50 per cent of the states. The material gathered from half the states was, in truth, so voluminous that the authors decided to report in 1947 on those making the early returns. The other states may be reported upon in 1948. The states, then, about which this review has been made are: Alabama, Arizona, Arkansas, Colorado, Connecticut, Delaware, Florida, Illinois, Indiana, Kansas, Louisiana, Massachusetts, Minnesota, Missouri, New Jersey, New Mexico, New York, North Dakota, Oklahoma, Pennsylvania, South Carolina, Vermont, Virginia, Wisconsin, Wyoming.

The authors were given access to the "Annual Report for the Fiscal Year 1946, Division of Elementary Education," as presented to the U. S. Office of Education by Dr. Bess Goodykoontz, director of the Division of Elementary Education. The 1947 report, then, falls into three sections.

SECTION ONE—REPORT ON ELEMENTARY EDUCATION FROM THE U. S. OFFICE OF EDUCATION

Excerpts have been taken from reports prepared by the Division of Elementary Education, as high-light summaries of the work under way at the Federal level:

> "The Division of Elementary Education is designed to serve in four major areas: Organization and supervision; instructional services; exceptional children and youth; teacher education . . . the Division's staff members have been concerned with both urban and rural schools; with children who are normal in their development and those who are exceptional in their rates of learning or handicapped by physical, mental, or emotional difficulties; with children varying widely in age, from the 2- or 3-year-old in nursery school or kindergarten to the 12- or 14-year-old who is ready for high school; and with parents, whose cooperation is increasingly recognized as essential to the best growth of their children in school. The magnitude of the problems involved is apparent when one considers that there are some 20,-

---

* The authors of this report acknowledge their indebtedness to Dr. Bess Goodykoontz, Director, Division of Elementary Education, U. S. Office of Education, and to the 25 State Directors of Education cooperating in 1947 for the facts presented in Sections One and Two of this report.

000,000 children in the elementary schools of the United States, each of whom must be treated as an individual and given an opportunity to grow in terms of his abilities."

The nice emphasis placed upon individualization is the key-note to the philosophy of education upheld in the field of elementary education by the Federal Office. Such a note is of primal significance for education in a democracy. Within the framework of this philosophy the Constitutional right of the American to be given an "opportunity to grow in terms of his abilities" can be realized.

The members of the Division of Elementary Education include a chief of the section on school organization, a specialist in nursery-kindergarten-primary education, a specialist for upper-grade education, a specialist on extended school services, a specialist on the education of exceptional children and one on the education of the physically handicapped; two specialists for science, two in health and physical education, a specialist in social studies, a specialist in rural education, and a research assistant. These specialists are available for consultation services in the states. Consultative services in states and communities have been as extensive as funds would allow.

> "The specialist in *nursery-kindergarten-primary education* consulted with State educational leaders in Maryland, New Jersey, Arkansas, North Carolina, Ohio, and Illinois on State plans for the extension of schools for children under six and on legislative matters relating to this problem. The specialist for *upper grades* was a consultant in conferences on curriculum and on supervision sponsored by State education departments in North Carolina and Virginia, and participated as discussion leader, resource person, speaker at conferences sponsored by educational institutions, and conducted workshops in Michigan, Georgia, Pennsylvania, Illinois, New Jersey, Nebraska, Tennessee, and Maryland. Requests for services of these types on all grade levels are constantly increasing and are an indication of the importance attached to the early years of a child's education.
>
> "The specialist for *science* visited State education departments in Florida and New Jersey, to assist in laying plans for the improvement of instruction and curriculum making in elementary school science. He also participated in workshops for elementary teachers in Kentucky and Michigan and held conferences with administrators and teachers in local school systems and with educational associations in Maryland, Kentucky, North Carolina, Colorado, California, Washington, and other States. . . . *Extended school services* were born just before and during the war, when the need of before- and after-school guidance for children of employed mothers became a matter of major importance. The program has proved its worth to such an extent that, when the end of the war came and Federal funds for this purpose were withdrawn, approximately three-fourths of the States continued their services in one form or another. Six States employed staff to supervise the programs; 4 States made appropriations to finance child care centers: and legislation was passed in a number of States authorizing local boards of education to establish kindergartens, nursery schools, and school-age centers, in some cases permission being given to use public school funds for this purpose. Workshops on extended school services, with sections on parent education, were held in Maryland, New York, Illinois, Oklahoma, Virginia, and New Jersey. The shortage of trained personnel is an ever present problem, especially as colleges and universities are organizing new services for the children of veterans in attendance upon college courses.
>
> "*Services for exceptional children and youth* have demanded unprece-

dented attention since the conclusion of World War II. Never before has there been such obvious and widespread interest in the establishment of adequate facilities for handicapped children on a Statewide basis as well as in local school systems. The specialist in this field, who serves on both elementary and secondary levels, considered legislative and organizational problems with some of the interested lay groups and with official educational agencies in New Jersey, New York, Kansas, California, Minnesota, Illinois, Vermont, Pennsylvania and North Carolina. Increasingly emphasis is being placed upon the fact that the education of exceptional children cannot be limited to any one level of the school system. It must begin early and go with the child through his adolescent years until he has achieved optimum adjustment educationally, socially, and vocationally."

The foregoing phase of the report has been given in some detail in order that those who read may seek guidance from the U. S. Office of Education in working on problems similar to those cited. It is the very wise policy of the United States office to come when called, to come when the local community seeks guidance from those who have, by reason of position, the national picture in mind. Several important conferences were held by the Division.

"A highlight of the year was the Leadership Conference in June, to which representatives of 17 national organizations met with the staff of the Elementary Education Division. The conference brought leaders in various aspects of education which have some relation to children in the elementary school, so that they might plan together for better things for those children. The list of organizations included both subject-matter groups and general education groups which have active programs in elementary education. A report of the conference was issued.

"Two meetings of the Association of State Directors of Elementary Education were held—one in Chicago, the other in Washington. At the latter basic principles of elementary school supervision were enunciated and reports of committee groups were reviewed. This Association carries on a continuing program, and it is one of the vital forces for the improvement of elementary education in the States. Six committees of the organization are now at work, studying the following problems: (1) the characteristics of a good elementary school with regard to staff, grades included, size, program, organization, and criteria for evaluation; (2) the coordination of school and community services for a 12-month developmental program for elementary school children; (3) programs for children below six years of age; (4) techniques for the stimulation of curriculum development throughout a State, with fruitful participation by teachers, parents, other lay groups, and resource persons; (5) programs for the continuous professional education of teachers; (6) school housing and facilities for a desirable educational program."

The Division has worked on several projects with staff members of other Federal agencies and cooperated with voluntary professional and public service agencies. Of great significance today is the service given by the Division on international problems.

"At the request of the Division of International Educational Relations, representatives of embassies and legations, UNRRA, and the State Department, the Division has cooperated in helping to meet the varied problems of persons from abroad who have come in increasing numbers either to study intensively in the United States or to familiarize themselves with the general nature of our educational system. . . .

"Some of the countries involved

in such relationships have given the staff many enjoyable and instructive hours, as well as a liberal course in geography: India, Poland, Czechoslovakia, Sweden, Turkey, England, Norway, China, Siam, Ethiopia, Japan, Korea, Uruguay, Chile, Peru, Algeria, Argentine, Austrialia, Belgium, Canada, Egypt, France, Germany, Holland, New Zealand, Palestine, Union of South Africa, Cuba, Greece, Italy, and Bolivia."

Dr. Bess Goodykoontz was sent to Germany to assist in the post-war planning for education there; Dr. Helen K. Mackintosh was sent to Austria to give similar service there. The U. S. Office of Education worked on these projects at the request of the Department of State and the War Department. Bulletins put out by the Division during the past year include: "Schools for Children Under Six"; "Camping and Outdoor Education in the School Program"; "Schools Count in Country Life"; "Science in the Elementary School"; and "Health Education in the Elementary School."

To supplement the publication program and to provide brief compact summaries of information on topics related to elementary education, particularly those which are subjects of frequent inquiry through correspondence, and to provide reading lists on specific topics, two series of mimeographed circulars were initiated in 1947, called, respectively, *Education Briefs* and *Selected References*. They include the following issues, already published:

EDUCATION BRIEFS

No. 1. Materials and Apparatus for Teaching Elementary Science

No. 2. Using Pictures at School

No. 3. Registration of Nursery Schools, Kindergartens, and Child-Care Centers by State Education Departments

No. 4. Changing Practices with Time Allotments

No. 5. Some types of Classroom Organization

No. 6. Health Plays in the Elementary School

No. 7. Good Posture for Boys and Girls

No. 8. Types of Experiences Children Should Have

No. 9. Periodic Reports of Children's Progress

No. 10. Workshop Techniques in Elementary Education

SELECTED REFERENCES

No. 1. The Primary Unit—An Aid to Children's Progress

No. 2. U. S. Office of Education Publications Related to Elementary Education

No. 3. Professional Literature for Teachers of Elementary Science

No. 4. Physical Education in the Elementary School

No. 5. Education of Exceptional Children and Youth. Comprises nine sections dealing with types of exceptional children as follows: (1) General References; (2) Mentally Deficient; (3) Mentally Gifted; (4) Socially Maladjusted; (5) Visually Handicapped; (6) Deaf and Hard of Hearing; (7) Crippled; (8) Speech Defective; and (9) Delicate.

No. 6. Nursery Schools and Kindergartens—The First Years in Elementary Education

No. 7. Recent Publications in Elementary School Health

No. 8. Health Songs for Primary Grades

No. 9. Sources of Materials on Child Development and Parent Education

No. 10. Child Growth and Development

No. 11. Low Cost Publications on Safety

No. 12. Reports of Pupil Progress for Parents

No. 13. Arithmetic in Elementary Education

The report, as given by the Office for the fiscal year 1945-46, is concluded with the listing of some major problems of elementary education, which are still pertinent, such as:

1. How can the elementary schools help prevent juvenile delinquency?

2. How can the elementary school promote good health in the American citizenry?

3. Closely associated with the behavior problem, too, is the matter of health and nutritional status. . . . With regard to teachers, we face one of the most critical situations ever encountered. Its increasing seriousness is evident from the fact that the number of emergency permits granted for teaching increased from 79,000 in 1945 to 108,000 in 1946. About three-fourths of these were in the elementary schools, where pupil progress and development are to so large an extent dependent upon the guidance of adequately prepared teachers. The recruitment of elementary school teachers and well-balanced teacher education program that places emphasis upon functional values rather than upon the acquisition of subject matter alone are matters of first importance. . . .

Closely related to this situation is the inadequacy of educational opportunity for children of migrants and for children in many rural and isolated areas. This is where the most crucial shortages of teachers occur, and where it is most difficult to plan and achieve vitally functioning educational programs. There is a trend toward fewer and larger farms and a consequent diffusion of the rural school population.

4. Shall the School year be twelve months?

5. What is an ideal community school?

The last two sentences of the report should be given publicity the country over in order that public interest be aroused to support a Division of the Federal government designed to give the important service being offered now by the United States Office of Education. The statements are:

"IT IS EVIDENT THAT THE PRESENT PERSONNEL OF THE DIVISION OF ELEMENTARY EDUCATION, AS LISTED EARLY IN THIS REPORT, IS QUITE UNABLE TO RENDER ALL THE SERVICE NEEDED. ITS EXPANSION IS A MATTER OF UTMOST IMPORTANCE IN ORDER THAT THE OFFICE OF EDUCATION MAY FULFILL ITS DESIGNATED FUNCTIONS IN RELATION TO THE ELEMENTARY SCHOOLS OF THE COUNTRY."

May it be noted in this connection that this Division is designed to serve over three-fourths of the school population in the country—and at that the most important age-group in the country.

SECTION TWO—REPORT ON ELEMENTARY EDUCATION FROM 25 STATES

The second source of information for this report is the collection of responses to the questionnaire as received from 25 states. The first question called for information regarding curriculum developments. There seems to be, as should be the case, the prevailing concept that the curriculum, with its courses of study, is a developmental thing. It is in state of flux and should be improved year by year. Some of the newer courses of which copies were sent to those reporting include the following:

Alabama. *Course of Study and Teachers Guide for the Elementary Schools.* 1941.

Wyoming. *Elementary School Guide.* 1946.

Wyoming. *A Guide for the Program of Instruction in the Language Arts.* 1945.

Massachusetts. *A Curriculum Guide for Primary Grade Teachers.*

Virginia. *Course of Study for Virginia Elementary Schools.* 1943.

Illinois. *A Basic Plan for Health Education and the School Health Program.* 1944.

Kansas. *Physical Education for Kansas Elementary Schools.* 1947.

Missouri. *Physical Education Supplementing the Courses of Study for Elementary Grades.* 1947.

New Jersey. *The School Health Program.* 1947.

New York. *A Manual of Instruction for Administrators, Physicians and Nurses.* 1938.

Kansas. *The Social Studies, Kansas Elementary Schools.* 1946.

Kansas. *Science for the Kansas Elementary Schools.* 1947.

New Jersey. *Building Citizenship in a Democracy through the Social Studies.* 1945.

Kansas. *A Program of Aviation Education for Kansas Schools.* 1946.

Wyoming. *Aviation Education for Wyoming Schools.* 1947.

New Jersey. *First Year in School.* 1944.

Illinois. *The Kindergarten.* 1946.

Kansas. *The Radio Classroom Teachers' Manual.* 1947.

Kansas. *Music Book for the Radio Classroom.* 1947.

Illinois has several specialized bulletins on education of the exceptional child; several states have bulletins on art, music, dramatics. Notably missing are bulletins on speech education. The general bulletins indicate certain trends in thinking by such titles as these:

Kansas. *Better Elementary Schools for Kansas.* 1947.

North Dakota. *Rules and Regulations for the Standardization of Rural Schools.* 1942.

Pennsylvania. *Local Participation in State-Wide Revision of the Elementary School Curriculum.* 1946.

Virginia. *A Handbook for Visiting Teachers.* 1947.

One of the most remarkable of bulletins received was in mimeographed form, from Kansas: *Basic Classic List for Elementary Schools.* 1947.

Special library circulation services are provided in many of the states. Such services may make the classics available.

Gratifying is the report in regard to health education in that the states are working on the program. There is evidence that the need for a constructive nutritional program and a constructive mental health program is being keenly felt.

A very challenging bulletin "Baltimore's Schools" placed in the minds of the writers this idea: Let popular magazines send out pictures, with appropriate legends, telling of ideal school work. The Baltimore bulletin is full of pictures that recommend good practices. Why not give such pictures countrywide circulation?

Reports from the 25 states are indicative of progress in curriculum building for the elementary schools of the nation. The progress is being made cooperatively by school people and citizens in more instances than ever before and to certain ends, in most cases. Wisconsin states the ends thus:

> "—an improved program for citizenship education, stressing democratic rights and responsibilities, based on loyalty to our American democratic heritage, as well as world-mindedness and international cooperation.
>
> "—bringing home the social and economic changes brought about by scientific advances and inventions such as the airplane, radio and television, the atom bomb, etc.
>
> "—greater emphasis on teaching children to read, write, and speak the English language and to use this ability in the democratic process of living and working together.
>
> "—an all-school program for the building of mental and physical health.
>
> "—greater stress on personality development and learning how to get along with others through growing up successfully.
>
> "—preparation for family responsibilities.
>
> "—improved vocational guidance so that every boy and girl may render the greatest possible service to society through useful work.
>
> "—emphasis on the science and mathematics needed for living in this age of scientific and mechanical progress.
>
> "—use of the arts, music, and literature for greater enjoyment of living.
>
> "—more realistic study of present-day social problems, such as conservation, employment, world peace, and the like, with the emphasis on teaching youth how to

make up their minds on such matters.

"—wider use of modern tools of instruction, such as motion pictures and other visual aids, radio and other auditory aids."

BUILDING PROGRAMS

Buildings for elementary pupils are greatly needed throughout the United States. Although several states have mentioned the passage of millions of dollars of bonds for new plants, the construction of additions and new buildings has been delayed for several reasons. The first years of the peace have failed to release construction material or to provide the necessary labor. Costs are also beyond the ability of many districts to pay at the present time. The per cubic foot cost has risen from a pre-war rate of 35-50 cents to over $1.50 in some cities. New York City let one contract at $1.60 per cubic foot, but refused to let other contracts at such a rate. The lack of materials, the scarcity of labor, and the rising costs of construction have combined to throttle building programs and to crowd school buildings with the increasing post-war enrollment.

However, some trends are discernible in planning for new buildings. The report from three states emphasizes cooperative planning by administrators, teachers, and parents. In Minnesota, there is a trend toward a larger classroom designed for fewer pupils. In addition to space provision for files, cupboards, and audio-visual materials, space provisions are being made in many places for shop work, home economics, libraries, science rooms, and auditoriums. Flexible seating, less blackboard space, more bulletin board space, are included in terms of newer concepts of the needs of children.

Many State Departments of Education are realizing and accepting their responsibility for giving leadership in school building construction. Bulletins and other helps are provided in Arkansas, Missouri, North Dakota, and Virginia. Pennsylvania recognizes buildings as "an integral part of 'curriculum.'" Florida's new program includes school planning in terms of engineered building.

EQUIPMENT

Adequate and sufficient equipment for a desirable educational program has not been available during the last several years. Some items have returned to the market for the first time this year. In many instances neither the quantity nor the quality measures compare with pre-war standards, although the price has increased from ten to one hundred per cent.

Ten of the 25 states returning the questionnaire indicate that there have been no special developments in the line of equipment during the year. Others indicate a definite trend toward greatly increased use of audio-visual equipment. The Army and Navy training programs have stimulated this movement. Arts and crafts are being encouraged in New Mexico, while New York has aided schools by the means of three helpful publications, "Planning the Outdoor Physical Education Facilities for Central School," "Planning the School Health Suite," and "Housing the Audio-Visual Program."

The Federal Government has given material assistance to the schools through the distribution of War Surplus Equipment of educational value at a discount of 95 per cent of fair value. All states have benefited from this program, to the extent of millions of dollars worth of equipment.

ELEMENTARY SUPERVISORS

New Jersey presents a unique system. Sixty helping teachers (rural supervisors) "attached to county superintendent's staff, are in reality, decentralized state staff." About 80 city or town supervisors are employed. Two supervisors in the state department's office provide general guidance on the total program. With 142 supervisors in the state, there is one for every 97 teachers.

Recognition of the importance of elementary education is to be noted in the employment of elementary supervisors within state departments of education. However, only a beginning has been made, and much progress may be anticipated within the next few years.

TRENDS IN SUPERVISION

The trends in elementary supervision can best be given as stated in replies received from six selected states:

Alabama: Trend is toward the development of local leadership . . . State offers stimulation and some service in the way of consultants.

Arizona: In-service education by getting all teachers in the state to work on revision of the course of study and curriculum.

Illinois: There is a definite trend away from the conventional inspectorial method to the idea of cooperation in the spirit of improving school situations. This involves visitation with subsequent group conferences.

New Jersey: The most important trend is toward a more democratic kind of leadership.

Pennsylvania: In Pennsylvania, I see a trend toward more building principals (not teaching) to supervise. There is a decided trend toward more help for elementary teachers.

Replies from the various states indicate trends in supervision which may be summarized as follows: increasing emphasis is being placed upon democratic leadership and creative supervision; state elementary supervisors are seeking increased participation in local and state studies and projects; there is a trend toward the employment of more elementary supervisors; more attention is being given to "in-service training" than ever before.

SPECIAL TEACHERS

Data concerning special teachers in elementary education are very meager. Only six of the 25 states were able to report on the number of teachers in art, music, physical education, health, and in other special fields. The one conclusion which can be drawn from the replies received from the questionnaire is that state departments need to give increased attention to this area of the elementary program.

PER CAPITA EXPENDITURE

The per capita expenditure for elementary education in the United States represents a meager outlay of funds for so important a program. The range from $22.60 in Vermont to $218.44 (including high schools) in Wyoming would indicate great variations in the democratic conception of the equality of educational opportunity for all youth. A tabulation of per capita expenditures is revealed as follows:

Range	Number of States	Range	Number of States	Range	Number of States
$20–29	1	$ 80– 89	1	$160–169	1
30–39	–	90– 99	–	170–179	1
40–49	2	100–109	3		
50–59	2	110–119	3	200–209	1
60–69	–	120–129	4	210–219	1
70–79	–				

These expenditures can be taken as a sign of a general trend in the cost of operation of the various states reporting, since there appear to have been different bases of computation employed. The information reported was insufficient to make possible a more accurate tabulation.

The per capita expenditures throughout the United States materially increased during the year. Local, state, and national publicity concerning the plight of the schools brought about some measure of awareness on the part of the public in general concerning the need for adequate support of education. Revenues have been increased through local taxation and state aid throughout the country.

MAJOR IMPROVEMENTS NEEDED

"What are the major improvements needed in the field of elementary education as interpreted by your department?" was the final question asked of the elementary supervisors in the various state departments of education. It is encouraging to note that the improvement most frequently mentioned related to a better understanding of child development, and the adjustment of the curriculum to individual pupils. There exists a general feeling of need for more adequate curriculum studies based upon the more recent developments in understanding child growth and the learning processes. This felt need is the hope of schools for the future.

"More teachers and better qualified teachers" is the second great need in elementary education. The following improvements desired in the various states were significantly important: reorganization of school districts, better and more adequate buildings, more and better supervision, smaller classes, and better equipped classrooms. The need for more adequate state support was mentioned by only one state.

Several individual statements are worthy of note. The elementary supervisor in Kansas senses a need for recognition of the importance of better elementary school buildings with proper equipment. Pennsylvania desires "a better teacher-helping program." The Virginia supervisor strikes an important note when he states that there is need for "developing closer co-ordination of effort among those working to improve elementary education." New Jersey is working on better evaluation procedures, a need expressed by several other states. An urgent need throughout the United States is pointedly stated by New York: "The child development point of view and the mental hygiene approach must be more widely accepted."

The various state departments of education are keenly aware of the improvements needed in elementary education. This awareness will bring about in-service studies, college preparatory courses in child development, and curriculum studies of adjustments to individual needs. Increasing attention to an evaluation program will bring about a clarification of the purpose of the elementary program and materially assist in determining the direction which the program is to take.

SECTION THREE—SALIENT OBSERVATIONS ON ELEMENTARY EDUCATION FROM OTHER SOURCES

An examination of the 1947 numbers of *The New York Times*, Education Page; the 1947 professional magazines on elementary education; and certain of the popular magazines brought to light certain additional features of the elementary education program in this country that bear study in order that the new directions taken may lead to the most desirable destinations. The features are these:

1. Teacher need: According to Dr. Harl Douglas and Dr. Lloyd Elliot, reporting in *School and Society* (66:No.1716) the 1947 school population between six and 13 years of age reached 17,011,000. For these children 13,500 additional teachers (above the 1946 demand) are needed. By 1948, the additional number needed, if one teacher be provided for every 30 pupils, will be 33,000. The need by 1955 will probably be for 134,200 more teachers.

What can be done to prepare for this great need of the most important of America's citizens? A recruitment program should be launched to find very intelligent high school students who would desire to teach if given a basic four years of superior college work in preparation for teaching and if assured of social status and adequate salary.

2. Better rural schools are needed. (See the significant bulletin "Schools Count in Country Life" written for

the United States Office of Education by Dr. Effie G. Bathurst.)

3. Reading should be taught as thinking—experiencing life. Better teaching in this field would cut down educational costs. In no field is better teaching so much needed.

4. Attention must be given to getting at the spiritual values through the right kind of education.

5. The American program of elementary education should be drawn upon for worthy contributions to the UNESCO program.

The report for 1947 comes to a conclusion with the naming of several important yearbooks dealing with elementary education. These important references have resulted from the cooperative thinking of the members of professional organizations. Significant volumes are:

Education of Teachers for Rural America, Department of Rural Education, National Education Association.

Early Childhood Education, Forty-sixth Yearbook, II, National Society for the Study of Education.

Future Teachers of America, Sixth Yearbook, Future Teachers of America, National Education Association.

Leadership through Education, Association for Supervision and Curriculum Development, National Education Association.

Learning World Goodwill in the Elementary School, Twenty-fifth Yearbook, National Elementary Principals, National Education Association.

Schools for a New World, Twenty-fifth Yearbook, American Association of School Administrators, National Education Association.

The Study and Teaching of American History, Seventeenth Yearbook, National Council for the Social Studies.

SECONDARY EDUCATION

By Robert S. Gilchrist and Mary L. Beauchamp
Minneapolis Public Schools*

ENROLLMENT

It is estimated that there are 6,300,000 students in the secondary schools in the United States in the school year 1947-48, only a slight increase over the number enrolled in 1946-47. Employment opportunities affect secondary school enrollment decidedly, as was evident during the depression and the war years. The decline in youth employment since the war has not been as rapid as anticipated. The National Child Labor Committee has outlined a four-point program as a campaign to encourage secondary school students in future years to stay in school. This program includes (1) efforts to eliminate exemptions for children under 16 years in the compulsory attendance laws and to bar all employment during school hours for children under 16; (2) efforts to regulate the type and amount of employment which school age children are permitted to undertake in addition to their school work; (3) efforts to secure compliance with child labor regulations; (4) elimination of factors that lie within the province of the school to remedy. The type of school program needed in order to hold those who now drop out is considered a major problem of secondary education today.

Educators are giving more attention to the fact that enrollment in the secondary schools is affected by the economic status of the home. Children whose parents are at the lower income levels do not have the educational opportunities they or their parents desire. Youth of equal intellectual ability do not have equal educational opportunities. Students without money find it embarrassing to go to high school and be unable to participate fully in student affairs. Impetus to provide financial opportunities for all secondary school students to attend high school is given by the report of the Commission on Higher Education appointed by President Truman to make recommendations concerning educational problems at the college level. This commission, under the chairmanship of George Zook, president of the American Council on Education, has recommended that free public education should be extended through the first two years of college. It is also recommended that fellowships and scholarships should be vastly expanded, with more subsidy recommended for the individual student who can not afford to attend the 13th and 14th years.

---

* The writers made extensive use of the following in collecting information for the review: *The Clearing House, Bulletin of the National Association of Secondary-School Principals, Educational Leadership, School Review, Education Digest, N.E.A. Journal, School Life, California Journal of Secondary Education, Educational Research Service Circulars, Progressive Education,* and *N.E.A. News.*

TEACHERS' SALARIES

Salaries paid during 1947 were substantially higher than those paid in earlier years. It is estimated that the average salary of teachers, principals, and supervisors for the school year 1947-48 is $2,550, which in terms of purchasing power will buy approximately the same amount of goods and services as in 1939-40. State legislatures during 1947 passed legislation which added $350,000,000 to the salaries of teachers. In some states, salaries were increased 50 per cent. Many teachers whose salaries were unusually low have been more than doubled. The National Education Association has recommended a $2,400 minimum and a $5,000 maximum for four years of training. Six states now have a $2,400 minimum salary.

TEACHER SHORTAGE

There is evidence that teacher shortage conditions were slightly improved in 1947 over the three preceding years. For the school year 1947-48, there are approximately 102,000 emergency certificates in use. In October 1946, the estimate was 110,000. In October 1946, there were 14,361 vacancies which could not be filled. In October 1947, this had been reduced to 7,633. The teacher shortage continues to be most serious in rural schools and in science and vocational fields at the secondary level. The quality of teachers, which is open to serious question, will be raised significantly only when states discontinue issuing emergency certificates. Such action is being urged by the National Commission on Teacher Education of the N.E.A. The commission also is recommending that life certificates be discontinued in favor of a certification system in which teachers will need to show evidence that they have kept up-to-date through continued professional study.

Enrollments in teacher education programs in the colleges of the country, although approximating pre-war enrollments, are far short of estimated needs for teachers. Unfortunately, the enrollments by states are not in terms of the shortages which exist according to an analysis by states. In wealthy states where salaries are comparatively adequate, high teacher education enrollments are found. In those states where salaries are lowest, enrollment in teacher education institutions is very low.

ATTITUDE OF LAYMEN TOWARD EDUCATION

Articles in lay magazines during 1947 changed in their emphasis of educational problems. For the past several years, magazine articles have dealt with the theme of good teachers leaving the profession, the fact that salaries are too low, the desire of teachers to be treated as human beings, and the necessity for something being done about it. During 1947, more articles appeared in which an analysis was made of how good a job of teaching is being done to prepare pupils for living under present day conditions. Laymen indicated that they are coming to believe that the welfare of America depends on the strength of public education. The campaign being carried on by the advertisers of America is indicative of the trend.

When the Advertising Council met in New York City in September, a non-profit national advertising campaign was launched informing the American people of the nation's educational difficulties and the importance of their schools. This campaign is appearing in magazines and newspapers throughout the country in the form of full page advertisements by various companies and businesses. Raymond Rubican, member of the Committee for Economic Development, called on the nation at the conference to devote more of its resources to education, no matter what else is cut or left out. He said, "We must equip ourselves for a bigger educational job, for our own salvation. If we have an ounce of national common sense, we will not permit the continued discouragement of our educators and the decline of our schools."

Labor's interest in education is indicated by an excerpt from a speech by Harold Hanover, secretary-treasurer of the New York State Federation of Labor, at an educators' conference in New York State: "The hour is late, but there is still time for the public awakening that can bring the correction of the injustices of other years which have brought the nation to its present unhappy pass in the field of education; which can make of education a dynamic process that readies the individual for his opportunities and responsibilities as a citizen, . . ."

FEDERAL AID

Senate Bill 472 was introduced in the United States Senate Jan. 31, 1947. The bill was bipartisan in its sponsorship. The purpose of the bill is to authorize an appropriation to assist the states and territories in financing a minimum foundation school program of public elementary and public secondary schools and in reducing the inequalities of educational opportunities. The chief provisions of the bill include: (1) Federal aid to assist the states where needed to finance a 40-dollar minimum program per pupil in average daily attendance; (2) distribution of funds to the states in direct proportion to need and effort and in inverse proportion to financial ability; (3) provision of $150,000,000 the first year, $200,000,000 the second, and thereafter $250,000,000 per year; (4) each minority racial group in each state is assured a proportionate Federal fund in an amount not less than the population ratio that each minority racial group in the state bears to the state total population; (5) the bill safeguards state educational controls.

When the second session of the 80th Congress convenes in January 1948, the drive for enactment of the Federal aid bill will enter its final stages. In the Senate the policy of the majority party is favorable. In the House the situation is not so clear. One of the chief issues has to do with public support for non-public schools. Senate Bill 472 provides that Federal funds may be expended by a state for any current expenditure for elementary or secondary school purposes for which educational revenues derived from state or local sources may legally and constitutionally be expended in such state. This provision adheres to the principle of state rights or state control. Each state would, under this provision, make its own decision on whether a private school might receive funds through Federal source.

MILITARY TRAINING

The National Education Association believes that compulsory peacetime military training is not necessary for our national defense under present conditions and is not an institution compatible with the American type of democracy. The N.E.A. delegate assembly authorized its defense commission to continue its efforts against the adoption of compulsory military training. The Secondary School Principals Association division of the National Education Association has also gone on record as opposed to military training.

The provisions of the present military training bill before Congress are largely in terms of recommendations made by an advisory commission on universal military training appointed by President Truman. This commission includes prominent educators and religious leaders of the country. The American Council on Education, which has consistently opposed the bills for universal military training which have been before Congress, had asked the President to appoint an unprejudiced commission to study military training. The commission named by President Truman, however, was not the commission as recommended by the American Council on Education. Many think that it includes members who were basically in favor of universal military training before their appointment to the committee.

Congressman Gerald W. Landis from Indiana introduced on Jan. 24, 1947, a resolution in the House of Representatives against the adoption of universal military training. The final paragraph of this resolution follows: "Resolved, That, before the United States adopts compulsory military service, the President of the United States, the Secretary of State, and the United States Delegate to the United Nations organization, Warren R. Austin, be, and hereby are, urged to work unceasingly for an immediate international agreement whereby compulsory military service shall be wholly eliminated from the policies and practices of all nations."

STATE EDUCATIONAL LEGISLATION

During 1947, nearly every state in the union passed legislation affecting education. In the main, this legislation had to do with making available to the schools more state aid. Arizona has a new school support law through which schools will now receive $115 per pupil in average daily attendance. Additional funds made available to Arizona schools by this law will average more than $1000 per teacher, with most of the money going into teachers' salaries. In Arkansas, there was an increase of $8,000,000 in the appropriation for the next biennium. California's new appropriation law provides a foundation program of $175 per pupil in secondary schools and $200 per student in junior colleges, plus state aid for transportation. Connecticut increased its state aid by over one-third. Iowa's appropriation of $13,000,000 is a 266 per cent increase.

Florida, by doubling the state appropriation for schools, indicated that the citizens of that state will be satisfied only with the best of educational facilities and conditions. Their program is the result of three years of concentrated efforts involving widespread participation of lay and school groups. When the legislature met, it was evident that the citizens wanted an improved school system. All the major educational bills were passed. A foundation program to provide minimum essentials was inaugurated. Seven hundred separate taxing districts were combined into 67. Ten months of service are required for all members of the instructional staff. Scholarships for prospective teachers have been increased to 1,000 annually. Improvements have been made in the retirement system.

JUNIOR COLLEGES

Social forces are at work in the United States which may bring about important changes in secondary education. The junior college movement has spread until there are now more than 650 such institutions, approximately one-half of which are units of public school systems. Since there is a general upgrading of the age of the working population as a whole, the press for more education and a different kind of education is coming both from those who are waiting to find places in adult society and from those who are looking for higher positions.

The American Association of School Administrators, at the 1947 convention in Atlantic City in March, went on record in favor of extending universal free education through the completion of the secondary school period, including grades thirteen and fourteen. They further stated that this education should be available irrespective of the financial ability of the individual family.

Commissioner Studebaker, in summarizing the need for an education beyond high school, says: "We need a new kind of school, a school to carry free public education two years beyond the present high-school level, a school to give every American youth an opportunity to get both the cultural and the vocational background he needs for a fair start in life. This is a job for a higher high school, a school in which the last two years of the present four-year high school would be extended and reorganized to bridge the gap between the general studies of the earlier years and the beginning specialization of vocational, technical, and professional education."

Throughout the nation, states are attempting to provide more opportunities at the junior college level. In New York State, regional institutes are being developed. The institutes are supported and administered by the state. The curriculums are planned to help youth gain competence for those occupations between the trades and the professions. They are organized on the principle that occupational competence, family life, religion, art, government, and education are inseparable parts of the organic life of both the individual and society.

Most educators, in considering the need for education beyond the twelfth year of high school, are recognizing that merely "tinkering" with existing systems by adding two years of college is not enough, that the two additional years of education needed are to complete their general education, to fit them for work and citizenship rather than merely providing college academic courses.

LIFE ADJUSTMENT EDUCATION FOR THE HIGH SCHOOL

The Office of Education arranged five regional conferences to discuss the implications of Dr. Charles Prosser's resolution of 1945. These regional conferences culminated in a national conference in the spring of 1947. The national conference recommended that there be established the National Commission on Life Adjustment Education. This commission has been appointed, and it is hoped that state departments of education, teacher training institutions, and local school districts will join forces in making a concerted attack to put more vitality into the secondary schools. It is hoped that work experience, training for family living, consumer education, car driving, health and safety, leisure time, and practical citizenship activities may become a part of the experiences of every boy and girl in his or her high school education.

Another approach to improving secondary education has been provided by the National Association of Secondary School Principals. The March 1947 issue of the Bulletin of this association is devoted to "a report of its committee on Curriculum Planning and Development dealing with the common and essential needs of youth in a democratic society. The report is in reality a nationwide survey of significant contributions to the curriculum by leading schools throughout the United States. The committee invited leaders in secondary education to designate schools which have made contributions with respect to one or more of the following imperative needs of youth.

"1. All youth need to develop salable skills and those understandings and attitudes that make the worker an intelligent and productive participant in economic life. To this end, most youth need supervised work experience as well as education in the skills and knowledge of their occupations.

"2. All youth need to develop and

maintain good health and physical fitness.

"3. All youth need to understand the rights and duties of a citizen of a democratic society, and to be diligent and competent in the performance of their obligations as members of the community and citizens of the state and nation, and of the world.

"4. All youth need to understand the significance of the family for the individual and society and the conditions conducive to successful family life.

"5. All youth need to know how to purchase and use goods and services intelligently, understanding both the values received by the consumer and the economic consequences of their acts.

"6. All youth need to understand the methods of science, the influence of science on human life, and the main scientific facts concerning the nature of the world and of man.

"7. All youth need opportunities to develop their capacities to appreciate beauty in literature, art, music, and nature.

"8. All youth need to be able to use their leisure time well and to budget it wisely, balancing activities that yield satisfactions to the individual with those that are socially useful.

"9. All youth need to develop respect for other persons, to grow in their insight into ethical values and principles, and to be able to live and work cooperatively with others.

"10. All youth need to grow in their ability to think rationally, to express their thoughts clearly, and to read and listen with understanding.

"More than a thousand schools were listed by the leaders consulted, and all these schools were invited to cooperate in the study by submitting curriculum materials, outlines, plans, and reports. These were analyzed, classified, summarized, and synthesized by the committee in light of the significance of their contributions to the satisfying of the ten imperative needs. . . .

"The discussion of each of the 'imperative needs' is supported by illustrations of successful practices of schools reporting contributions in the particular curriculum area. The committee concludes, on the basis of the contributions considered, that the provisions being made for youth in many of the schools are worthy of commendation. However, the committee warns that the many schools not reporting need to prod themselves educationally to provide for all their youth, and that all schools would profit by checking their objectives and practices against these findings."

Significant publications on secondary education during 1947 include the Eighth Yearbook of the John Dewey Society entitled *The American High School: Its Responsibility and Opportunity* and *Reorganizing the High School Curriculum* by Harold Alberty. Both these books emphasize that an important basis for determining the curriculum should be the developmental needs of adolescence. The books urge educators to decide the nature of the curriculum in terms of the demands that life makes on young people. The values that our democracy holds to be important are considered to be another important criterion in terms of which to measure the effectiveness of the school.

CITIZENSHIP AND IMPROVED HUMAN RELATIONS

Research indicates that the high school student himself is concerned about citizenship and human relations problems. In a survey in the state of Washington of 6,000 members of the graduating classes of 154 high schools, it was found that more than 30 per cent of the students felt that the United States has more responsibility than any other nation toward the future of the peace of the world. The survey also indicated that just as many students were groping for spiritual security and not finding a satisfying answer in their search. Secondary school counselors and teachers are finding that high school boys and girls are attempting to clarify their values and to develop reasons for living which give their lives direction. Perhaps no emphasis is being made in the secondary schools which has more promise for changing the substance and structure of secondary education than the attempts of schools to provide better citizenship education.

These attempts are, in the main, finding their points of departure in projects where there is an emphasis to improve human relations. This is being done not only because of the close relationship between improved human relations between individuals and the possibility of a stronger democratic nation in this country and a stronger world which can learn how to avoid war, but also because of a recognition of the needs of individuals. It is being recognized more and more that improved human relations must come about through individuals clarifying and establishing the values by which they live. As one educator states the trend, "there is developing a concern for a new concept of education, namely, that teachers ought to do more in helping young people clarify their attitudes, beliefs, and values so that they will better know what it is they do believe and to what the consequences of their beliefs seem to lead."

Schools are trying a variety of approaches in their emphasis on human relations. In Delaware schools, periods are devoted to a project for improving human relations. Stories illustrating such themes as the following are read and discussed: Emotional Problems at Home, Inferiority Feelings, How Emotions Affect Us Physically? Overcoming Personal Handicaps and Unpleasant Emotions. Students analyze the emotional forces involved, isolate and discuss the conflicts and problems of the characters, evaluate their personalities. This approach gives the students more security in talking about themselves. They often comment on a similar problem which they have faced and how they attempted to solve it. Belief in this kind of procedure is based on the idea that children gain insight into themselves through such discussion. From this self-understanding, they achieve more tolerance and more appreciation of other people and the problems of other people. Other schools are using sociometrics and sociodrama techniques to help youth realize the factors that are at play in groupings and in the solution of individual and group problems.

Teachers in each of the subject fields are becoming more cognizant of the possibility of their subjects for helping students to understand themselves and how to get along with other people. For example, in the study of literature it is often possible for teachers to select stories or books which portray a problem in the realm of human relations. Problems of discrimination, segregation, and social isolation as they relate to individual communities and to the nation as a whole are studied directly in social studies classes.

A starting point for improving human relations in a school, thereby contributing to citizenship education, has often been an attack on problems arising because of the tensions between individuals and groups of different races, creeds, nationalities, and economic levels. Schools which have been working in this area of intergroup education have profited immensely from the activities of several national groups whose purposes have been to improve intercultural and intergroup education. Among these groups are included the American Council on Education, the American Association of Teachers Colleges, and the Bureau for Intercultural Education.

FAMILY LIFE EDUCATION

According to one writer in a lay magazine, not very much is being done about education for family life, especially that phase which deals with sex instruction. This writer states that 20 per cent of the country's schools do absolutely nothing in this area. In another third, the individual teachers do offer some personal guidance to individual students, and less than half provide special lectures by the school nurse, the doctor, or some outside expert scheduled at infrequent times. The author of the article feels that these special lectures often leave young people more confused, afraid, and maladjusted than before because they are not part of a well thought through plan for providing experiences in the regular school curriculum in the area of home and family living.

After taking a course in college on marriage and the family, three Texas young people stated the case rather succinctly for home and family living education at the high school level. These individuals say:

"When we were in high school, we were confused and bewildered by vague, sporadic, and conflicting notions regarding marriage. We had gathered these ideas from movies, magazines, and casual, jocular advice from our fellow students, our parents, and our elders. From the two latter groups too often came the admonishment—of no particular value, 'Just wait till you're married; then you'll find out for yourself.'

". . . Remembering that the majority of high-school students do not go on to any sort of college—only 29 per cent of high-school graduates ever enter college—we believe that marriage should be studied before the completion of the twelfth grade. . . .

"We believe that such a high-school course should be essentially the same as that offered in a college curriculum: history of the family, the function and social importance of the family, mate selection, the period of courtship, the problem of marital adjustments, the unhappy union, and the chief factors contributing to successful marriages.

"Somewhere in the course we believe that the facts of sex and human reproduction could be discussed as a significant, but certainly not exclusive, aspect of the marriage relationship. We are aware that the inclusion of this last point is a moot question among educators today; but we believe that the effect of teaching sex as a part of the course in marriage and the family would place sex on its natural plane without giving it undue emphasis in the minds of the young people receiving the instruction. . . .

"Decidedly, there is a gap between the eager questioners and the available information. That gap can best be filled, we feel, by giving high-school students the opportunity to tap reliable sources on marriage and family relationships. They will have a very intense, and certainly justifiable, interest in the materials that may be thus presented, and they will reap a rich harvest of information and attitudes of the proper sort relating to what most of us would characterize as the most important aspect of life!"

Home and family living is receiving more attention by national organizations. The Family Life Institute held a national conference at Berkeley, Calif., during the summer; and the California Adult Education Administrators meeting held one entire section on the subject. Progress is being made along several fronts: (1) many cities are experimenting with community organization for better family living; (2) secondary curriculum is being reorganized to include courses in family living and family relations; (3) lay and teacher leadership is being trained through national institutes and in-service courses; (4) materials suitable for use by high school students are being developed. Some foundations are sponsoring research for this purpose; (5) systematic efforts are being made by groups of medical and health workers, educators, psychiatrists, and religious leaders to develop the best techniques for teaching sex education.

WORK EXPERIENCE

Since 1930, educators have been forced to consider the relation of work experience to the program of the schools. During both the depression years and the war years, educators recognized that there were educational values to be derived from work experience, providing the work was of an appropriate nature and adequately supervised. It is becoming increasingly evident that work experience, if it is to be a part of the lives of adolescent boys and girls, can be so only because society recognizes that work should be the birthright of every American boy and girl as he grows into a young adult. When Wilson Ivins of Indiana University surveyed the field of work programs early in 1947, he found that work programs have probably quadrupled in the past decade. According to the results of his survey, 1,859 secondary schools of the United States have some form of work programs. Five hundred sixty-four offer school part time work programs in diversified occupations; 545 offer cooperative distributive occupation work programs. One hundred eighty high schools have other cooperative programs, including primarily trade and industry. Two hundred seventy-nine high schools report that they operate camps. Two hundred thirty-seven of these are in the state of California. Two hundred ninety-one schools commented that they have community schools and, in that sense, offer work experience as an integral part of their program. There seems to be a definite growing interest in cooperative education in which students near the end of their formal education work part time under the supervision of a staff member of the school and go to school the other part of their time, taking subjects in which an attempt is made to relate their instruction at school with their experiences on the job.

HEALTH AND RECREATION

The high percentage of rejectees during the war emphasized the need for more attention to health in the secondary schools. Judging from the educational literature published in 1947, very few school systems have crystallized their thinking about how to improve health programs. Three trends which seem to be characteristic of most developments are encouraging: (1) the health program is a responsibility which must be shared by the entire school; the tendency in the past has been to make health a responsibility of a single person or department, usually the physical education teacher; (2) the health program must be made vital and dynamic in the lives of students; it must become functional to the extent that it affects the behavior of youth, that youth take pride in their own physical well-being; (3) the health program of the school must seek the active cooperation of all related community agencies; there must be a coordinated approach to health, and the school seems the logical coordinating body.

School systems, in revising their health curriculum, are recognizing the importance of these trends, and teacher education is beginning to take place to make possible a more functional health program. Prospective teachers in California, for instance, make a study of community organizations which offer health services.

Many schools have found the establishment of a health council, representing school and community personnel, an effective way to determine policy and isolate and solve problems as they come up.

Educators in the secondary field seem to be rapidly accepting recreation as a legitimate function of the high school. This acceptance comes as a result of believing that recreation is an antidote for delinquents, or that leisure hours demand training in recreation, or that recreational activities contribute to developing those behavior characteristics necessary for democratic living, such as ability to get along with each other, recognition of the rights of others, and respect for the dignity of an individual.

California has been a leader in the recreational field. The state has two laws, the Civic Center Act and the Recreation Enabling Act, which stimulate the development of recreation in the schools of the state. The state department has recently established a unit on recreation in the Division of Health, Physical Education, and Recreation. In Los Angeles, a youth service program has been introduced and placed as an integral part of the curriculum division in the school organization. Seven areas of activity are outlined as legitimate pursuits for schools, and supervisors are provided to render service to the schools in developing their programs in these areas. The activities include intramural sports, sports carnivals, athletic clubs, off-campus activities such as swimming, hiking, excursions, bowling, camping in the summer and on week ends, group activities such as social dances, co-educational play days, festivals, and special interest activities such as arts and crafts hobbies, special dance groups, drama, music, and art.

The Federal Government has indicated its growing interest in assisting in the field of recreation through the establishment of an inter-agency committee. This committee includes membership from the various parts of the Federal Government which have functions in relation to recreation.

Camping and outdoor experiences are receiving increased emphasis on the part of secondary school educators. According to the American Association of School Administrators, only five per cent of the boys and girls enrolled in schools in the United States have had any type of camping experience. Educators recognize that most boys and girls could profit not only physically but socially, emotionally, and intellectually from a form of camp experience. Camping provides a natural and realistic environment for learning and permits boys and girls to practice democratic living in a simple and direct fashion.

AUDIO-VISUAL EDUCATION

According to a survey of the Research Department of the National Education Association, 80 per cent of the school systems in cities over 100,000 population have special audio-visual departments. There are fewer departments in schools as the sizes of school systems grow smaller. Of all cities reporting in the survey made, three-fourths estimated that their method of selecting, utilizing, and administering radio and film aids was not satisfactory. The median per pupil expenditure for instructional materials, apparatus, equipment, and administration in the audio-visual field was thirty-three cents.

A significant development in audio-visual education is the formation of the Film Council of America, a national organization designed "to foster and promote the production, distribution, and use of the informational film media for the general welfare of all people." Seven national organizations have joined together in the creation of the Film Council. The purpose of the Council is to coordinate and intensify the efforts of numerous existing and prospective organizations interested in the development and use of educational films.

Radio as a means for improving education is receiving increased attention on the part of educators. One writer states that radio can (1) vitalize the work of the classroom, (2) supplement and enrich school room educational experience, (3) motivate students to further learning, (4) train youngsters in discriminating listening.

The use of FM radios is increasing. The Federal Communications Commission has cleared twenty channels for educational use. State-wide networks are now being planned in Alabama, California, Connecticut, and eighteen other states. Large city school systems like Cleveland, New York, Chicago, and San Francisco, and universities such as the University of Illinois and the University of Kentucky are already making use of FM frequency radio broadcasts. There are now twenty-one stations under construction. A goal has been set to blanket the country in the next five years with FM radio station coverage. The United States Office of Education and the Federal Radio Education Committee are giving leadership to this movement and are anxious to help the states in planning their networks.

Television is appearing on the horizon as a part of the regular school program and is being experimented with on a limited basis.

TESTING AND EVALUATION

The Educational Records Bureau estimates that 60,000,000 standardized tests were administered to about 20,000,000 persons in the United States in 1944. Military and civil service use accounted for a large share of this number, but 26,000,000 tests, it is estimated, were given by educational institutions, business firms, and personnel consultants to more than 11,000,000 individuals. There is a trend since the war for schools to examine their testing programs and to employ more adequate testing technicians.

It is estimated that between 600,000 and 700,000 veterans have taken the high school level General Education Development tests and at least 500,000 have received high school diplomas or equivalency certificates. In terms of their experience with G.E.D. tests, 11 states have already accreditation policies to include the awarding of high school equivalency diplomas or certificates to non-veteran adults, as well as to veterans. In all of these states, the G.E.D. tests are being used as the basis for granting these certificates. The wartime experience with the General Education Development tests has sharpened the question of whether educators can devise a means of determining how much and how well a person has learned which will be more accurate and more useful than a mere transcript of his record in school. The G.E.D. tests themselves are at least a partial answer to this question.

Many schools are recognizing that they can no longer send report cards to parents which are limited to assigning marks in the traditional subjects if at the same time the schools are saying that they include in their purposes the development of desirable citizenship qualities, the ability to understand and participate effectively in home and family living, and other comparable purposes. In Portland, Ore., one high school has changed its report card to include achievement in skills and understanding and in habits and attitudes. The school's report to parents is in terms of whether the child's achievement is better than, consistent with, or poorer than could be expected in the light of what the school knows about him. This Portland high school has decided that evaluation of achievement should be in terms of an individual's ability and measurement in terms of himself, rather than a comparison with the group.

ADMINISTRATIVE POLICIES AND PROBLEMS

Educational literature of 1947 seems to indicate that secondary school principles are becoming more clear that the major purpose of school administrators should be to enable pupils, teachers, and parents to work together in developing an effective program of education. Illustrative of the kind of planning being done by some secondary school administrators is a report from a committee of the fourth annual state-wide Conference of Maryland High School Principals. This committee identifies five areas of administrative activity by which the principal can best implement an effective program: (1) adjusting the school's schedule to provide a more functional program; (2) making available adequate facilities; (3) providing supervision conducive to the evolving of the new program; (4) making available adequate guidance services; (5) formulating working techniques by which to evaluate the success of a program.

An agreement reached between the colleges and secondary schools of Michigan may indicate a trend which will free high schools to more effectively serve all boys and girls. In Michigan, an alternative plan of admission to college is offered to all university approved secondary schools which pledge to assume certain responsibilities for the all-round development of youth and for keeping more complete records of growth.

During 1947, many schools moved in the direction of opening their facilities for more time than the traditional five days a week, seven hours a day, 36-38 weeks a year. In Madison, Wis., the schools were opened on Saturday, with more than 3,600 boys and girls attending school voluntarily. The Saturday program includes such features as sports and games, crafts, dramatics, music, gymnastics, club activities, motion pictures.

The schools at Rochester, Minn., and Glencoe, Ill. now employ their teachers on a 12-month basis. This enables the school systems to sponsor summer activities of an educational and recreational nature. Commissioner Studebaker, in addressing the secondary school principals of the nation at their February meeting, predicted that all secondary education in a few years would be concerned with the activities of boys and girls the year around. He emphasized the possibilities of outdoor and camping education as part of this year around program.

As secondary schools attempted to provide a more functional organization in which the real problems of boys and girls constitute the curriculum, more consideration was given to assigning a teacher to teach a group of boys and girls for a block of time longer than an hour. Generally, this teacher assumed the guidance responsibility for the boys and girls whom he taught in this core or common learnings block of time. This curriculum organization which attempts to break down subject field barriers permits a teacher to work with fewer students during a day. He works with the same students for a longer period of time, thereby learning to know them better. The pupils are given a chance to participate in planning for the activities of the unit being studied. The units are based on the personal and social problems which confront young people as they grow up.

PARTICIPATION BY FACULTY, STUDENTS, AND PARENTS

Present emphasis on the importance of group participation in planning the secondary school program is indicated by articles in various educational magazines during 1947. In Battle Creek, Michigan, the curriculum development program provides opportunities for many staff members to work together in improving the instructional program. Recognition is given to the importance of the individual school being the unit for curriculum development. In Battle Creek, meetings of the general faculty, principals, supervisors, counselors, and working committees are held on school time. Meetings of study groups organized on a voluntary basis are held after school.

In Winnetka, Ill., the staff, through their group planning and sharing of responsibility, have come to certain conclusions: (1) they believe that it is important for all persons affected by decisions to share in making them; (2) individual activity contributes to group activity; (3) the personal and educational growth of teachers is stimulated through direct personal participation in group planning; (4) group decisions must be based upon accurate and well assimilated information; (5) the best leadership is group leadership; (6) genuine authority should accompany responsibility and vice versa; (7) group planning and action is a means to better supervision. Faculty participation in improving secondary education is widely sought in Minneapolis, San Diego County, California, and many other places throughout the nation.

There is a trend not only for students to participate more completely in their own individual school's community life but also to join together with students of other schools in joint enterprises. In Minneapolis, the senior high school student councils have joined together to establish an all-city student council. This student council heads up the activities of high school students in civic projects, such as helping to acquaint the public with school financial problems and providing help to distressed communities in Europe. In California a state association of student councils has been formed. The Secondary School Principals' Association sponsors a national association of student councils.

The student council president at Alice Deal Junior High School, Washington, D. C., summarized the yearning which adolescents have for feeling that they belong to a group when he said, "Give us kids something to live up to and we will be all right."

Participation in creating an effective secondary education includes not only faculty and students but also parents, according to several leading educators who describe effective programs in the educational literature of 1947. Morris R. Mitchell describes the completely cooperative life of Williston, Minnesota, where education is a family and community activity for young and old. In Williston, the school nursery is a community enterprise. The library is a materials bureau for everyone. The recreation hall serves youth and adults. The community owned forest is the special responsibility of the secondary and junior college groups. A higher standard of living and a profound respect for human beings are outcomes of the Williston program, according to Mitchell.

The Sloan Foundation experiment in home economics provides evidence of the improvement in standards of living which can be brought about through the cooperative effort of adults, teachers, and laymen working together. Experimentation in housing was carried on in Florida, on food in Kentucky, on clothing in Vermont.

EDUCATION FOR THE PROFESSIONS

By Earl W. Anderson and Clara Henderson
Department of Education, Ohio State University

GENERAL

Common concerns of those educating for the professions were expressed during the year 1947 over the following problems: meeting the changing needs and demands of society; providing satisfactory preparation in expanding programs for increasing numbers with inadequate staffs, funds, and facilities; securing the most able students; determining new types of experience necessary for modern professional preparation; keeping the practitioner up-to-date; developing more effective teaching methods; and promoting needed research. Trends in education for the professions are toward increased emphasis upon general education, longer curriculums, integration of courses, greater cooperation with industry, and more extensive use of community resources. Large increases in enrollments or in applications for places in most professional schools have overloaded staff and facilities. Increasing numbers of foreign students are seeking professional education opportunities in the United States. The Division of International Educational Relations of the United States Office of Education offers its facilities in evaluating credit from foreign institutions.

DENTAL EDUCATION

Enrollments.—The total undergraduate enrollment in the 40 dental schools of the United States, as of Oct. 5, 1946, was 8,287, of whom 117 were women. Forty-eight per cent offered two years of liberal arts education for admission; 24 per cent offered three or four years but no degree; whereas 28 per cent offered a bachelor's degree. Students enrolled from every state. The maximum of 10,000 which can be handled in existing schools is expected to be reached in the next few years. The Council on Dental Education predicted a freshman dental school enrollment of 3,022 in the autumn of 1947. During the year ending June 30, 1946, a total of 2,666 students in the United States received dental degrees, 264 completing combined courses. The annual average for the previous five years was about 1,700. The peak was in 1945 when there were 3,212 graduates. In November 1946 the number of women dentists in the United States approximated 1,000.

Selection.—The Council on Dental Education initiated a program of aptitude testing in dental schools in the fall of 1946, not as a condition of admission, but to secure data over a five-year period to determine who should study dentistry. Objectives of the test are to measure the student's abilities; to read with understanding the type of material that he will expect to read in dental school; to memorize verbal and visual material; to visualize patterns and relations without the necessity of preparing drawings; to express himself verbally and in writing; to use his hands and fingers skillfully and dexterously; and to comprehend general and scientific word meanings.

Curriculums.—A poll of dentists by the Pierre Fauchard Academy Poll Panel during 1947 revealed that 21 per cent of them would increase pre-dental requirements, whereas, 79 per cent would not. Thirty per cent would confine pre-dental courses mainly to scientific and related subjects contributing directly to professional needs, and 64 per cent would include liberal arts training. Six per cent believed that the dental course should be lengthened, while 8 per cent would shorten it, and 86 per cent would not change it. A previous poll had shown that 84 per cent of dentists considered the usual dental college curriculum inadequate for meeting the needs of the dentist in practice. Several short and "refresher" courses have been announced. The University of Minnesota, with the aid of a grant of $95,975 from the W. K. Kellogg Foundation, has established short courses emphasizing closely supervised clinical work for discharged dental officers of the Army and Navy and for general practitioners. Extension courses are offered dentists at the Dental University of Detroit. The scheduling of two-week, one-week, and a day-a-week postgraduate courses during 1947-48 is announced by the University of Michigan, in cooperation with the Kellogg Foundation Institute. The program is open to civilian dentists and returned servicemen to whom less expendable instruments are provided on a loan basis.

Announcements.—In order to give the Dental Branch of the University of Texas equal status with the Medical Branch, Dental Dean Elliott was elevated to a vice presidency of the University, a position comparable to that held by the medical dean. Temple University's new million-dollar home for its School of Dentistry was expected to be ready by autumn, 1947. Three prominent leaders in American dentistry left for Europe in June 1947 to organize a series of refresher courses in modern dental techniques for dentists among Jewish displaced persons in Germany, Austria, and Italy, under a program sponsored by the Joint Distribution Committee, an American agency aiding Jewish survivors overseas.

Fellowships and Grants.—In April 1947, Northwestern University received a $100,000 gift to support fellowships, teaching, and research in dentistry for children. The Ohio State University received a Kellogg Foundation grant for dental research in 1947. What is planned to be the greatest medical research center in the world will be built at Forest Glen, Maryland by the Office of the Surgeon General at an estimated cost of $40,000,000. The Institute of Medicine and Surgery will house research dentistry, research medicine, veterinary medicine, research surgery, x-ray and radiation, and preventive medicine.

ENGINEERING EDUCATION

Need for Engineers.—According to Karl T. Compton, future demands for engineering graduates will more than double those existing before the last war. A survey conducted among 125 large companies by a Committee of the American Society of Engineering Education also indicates an increase in future annual demands for engineers. The number graduating from engineering schools declined steadily to a low in 1947 of less than 7,000, including those in Army and

Navy sponsored programs, as compared with almost 15,000 graduates annually in the early war years. The Division of Higher Education of the United States Office of Education is analyzing engineering enrollments to follow up its recent study of supply and demand in that profession. In cooperation with the American Society for the Advancement of Engineering Education, it reported the total enrollment in the professional schools of engineering in November 1946 as 223,000 including 93,000 freshmen. This was 340 per cent of the enrollment for 1945. In May 1947 the Veterans' Administration reported the enrollment of 171,885 veterans in engineering curricula under Public Law 16 or 346. Industry continues on-the-job training in engineering education and research.

Curriculums.—The Committee on Engineering Schools of Engineers' Council for Professional Development has again deferred its proposed review of curriculums of member schools until college conditions are more normal. The Mechanical Engineering Department, along with other divisions of the Institute of Technology at the University of Minnesota, has adopted a five-year curriculum for entering students other than veterans of the Second World War. This program leads to the Bachelor of Mechanical Engineering degree. Students with 1.8 honor point averages, or higher, will receive a Bachelor of Science degree, upon petition. Effective September 1947, the North Carolina State College of Agriculture and Engineering increased the amount of time devoted to the humanities in its undergraduate engineering curriculums, although reducing the total credit hour requirement. A fifth year of specialized graduate work leading to a master's degree is available to superior students. Plans at Cornell University provide for an expanded program of instruction and research in Diesel Engineering following the receipt from the Navy Department of Diesel engines and related equipment valued at more than $2,000,000. Agricultural engineering is strengthening its affiliation as a phase of engineering education. Agricultural engineering schools are administered as follows: by school of engineering, 8; jointly by engineering and agriculture, 9; and by school of agriculture, 10 (7 of these are in southern states).

During 1947, Engineers' Council for Professional Development approved for the first time a curriculum administered jointly by the schools of engineering and agriculture. Thirty land-grant colleges and universities offer professional agricultural engineering curriculums, or the equivalent, with 23 institutions conferring the Bachelor of Science in Agricultural Engineering degree, four granting the Bachelor of Science in Engineerng degree or a major in Mechanical Engineering, Civil Engineering, or Electrical Engineering, and three offering the work as a major in agriculture. Three schools offer two curriculums in agricultural engineering; one in agriculture and the other in engineering. Renssalaer resumed the senior thesis as a requirement for graduation in engineering, having discontinued it during two war years. The University of California at Berkeley has surveyed employment histories of its engineering graduates for help in reconstructing its program.

Engineering Societies.—*Who's Who in Engineering* lists 71 national groups as engineering societies. However, only the National Society of Professional Engineers limits its membership to professional engineers. It reports a membership of 13,000 and an expectancy of 25,000 members by the end of 1947. The largest and most important societies, while retaining their own autonomy, are joining forces to study professional problems in two major Councils, The Engineers' Council for Professional Development and Engineers' Joint Council.

Scholarships and Awards.—The George Westinghouse Award in Engineering Education was established in 1946 for the purpose of encouraging outstanding achievement in the teaching of engineering. The award consists of $1,000 and an engraved certificate. The Bausch and Lamb Honorary Science Award Medal and Science Scholarships are examples of recent efforts of industrial companies to stimulate interest in the engineering profession.

JOURNALISM EDUCATION

Enrollments.—*Editors and Publishers* reported in 1946 that the nation's colleges and universities were then training twice as many students for careers in journalism as before the Second World War. In the 52 schools and departments of journalism listed there were 13,874 students—8,641 men and 5,233 women. A pre-enrollment survey indicated an estimated enrollment of 18,000 journalism students in all colleges by 1947. From 50 to 75 per cent hoped to find employment in newspaper departments and about 10 per cent, respectively, in advertising, publicity, public relations, and radio journalism. Approximately 800 were studying press photography. Nearly 80 per cent of the schools reported some facilities for photographic studies, 12 with complete laboratories.

Faculties.—Journalism teaching faculties were doubled, most additional help being provided by visiting instructors from newspapers, magazines, and radio. Newspaper cooperation included "everything from free copies to scholarships and jobs." As a result of this cooperation, faculties believe they are turning out a larger number of graduates with a practical view toward the basic requirements of the profession. The Accrediting Committee of the American Council on Education for Journalism continues its intensive study in an attempt to determine a sound basis for accreditation of schools of journalism. The Committee is attempting to provide for flexibility within individual programs rather than to set up fixed standards. By April 1947, 151 schools had been invited to apply for accreditation, and 43 had replied to questionnaire forms devised to supply the Committee with approximately 40 items of factual data which should reflect the resources available for journalism education. Through the use of a profile, the accrediting group will compare the overall pattern of a particular school with the majority practice. A system of visitation has been set up whereby members of the Committee, regional representatives, lay persons, and specialists in certain aspects of journalism will visit a school including such intangibles in their observations as student morale, teaching effectiveness, and school prestige. First visitations began during the summer of 1947, and the first accredited list will be announced in 1948. Major newspaper associations are cooperating with the project, and a $15,000 Carnegie Fund grant helps to finance it.

Curriculums.—A study of curriculums in 60 small colleges showed that the number of journalism courses varied from none to eleven. The four most commonly offered were, (1) Newswriting and Reporting, (2) Copyreading and Editing, (3) Feature Writing, and (4) Creative Writing. Syracuse University School of Journalism has launched two new specialized graduate curriculums leading to the master's degree for students interested in advanced preparation for public relations and for newspaper editorial work. The Universities of Illinois and Minnesota have created institutes for advanced journalism research.

LEGAL EDUCATION

Enrollment.—*The Statistical Abstract of the United States* reports 32,388 students in law schools for the year 1944-45. Of these 2,001 were women and 613 graduate students. An increasing number of law school graduates are taking graduate work. Graduates of recognized foreign law schools are enrolled for the degree of Master of Laws which is accepted as a basis for admission to the Bar examination.

Curriculums. — The Curriculum Committee of the Association of American Law Schools reported in December 1946 that "the trends in curriculums of the member schools are: first, an increase in course offerings and an overall increase in time requirements for graduation; second, an awareness of the relationship of law to the social sciences; third, a greater emphasis on public law; fourth, where the major revisions have occurred, a reduction or the elimination of electives; and, fifth, the recognition that the summer term has become a part of the regular school year."

Northwestern University has a "group unit plan" with each term considered as a unit with related subjects included. Some schools are adding regular summer terms to their present programs. More emphasis is found in public law, administrative law, international law, and taxation.

Harvard University Law School is now engaged in a survey of its alumni to determine the "branches of law" that are met in actual practice. Curriculum changes in light of the findings are anticipated.

In-Service Education.—In June 1947, Arthur A. Ballantine, president of the Practicing Law Institute, reported that "more than 25,000 members of the Bar continue their professional education through the publications, lecture courses, and correspondence courses conducted by the Practicing Law Institute under the sponsorship of the section on legal education of the American Bar Association. More than 6,700 veterans participated in this program through the G. I. Bill of Rights. More than 30,000 sets of lessons were purchased and more than 12,000 lawyers attended the lecture programs. Correspondence courses covering 20,000 lessons for practicing lawyers have been utilized by more than 2,300 lawyers. Lawyers from 32 states attended the Institute's two-week summer session held in New York City in 1946. A four-week session was held in 1947. Expansion of this program for licensed lawyers is planned under a directive from the House of Delegates of the American Bar Association."

Committee Activities.—The attention of the committees of the Association of American Law Schools has been focused upon standards for legal aid clinics, teaching methods, opposition to lowering the Bar examination requirements for veterans, and to cooperation between the law schools and the Bar. The American Bar Association completed in April arrangements for a three-year survey of the profession of law by a council of the American Bar Association with Arthur T. Vanderbilt, dean of the New York University School of Law, as director. This study of the lawyer in contemporary America will include information as to how lawyers are educated.

MEDICAL EDUCATION

Financial Support.—There are 70 medical schools in the country recognized and approved by the Association of American Medical Colleges. Of these, 42 are maintained solely by income from private endowment, gifts, and tuition fees. Twenty-seven are wholly or partly tax-supported. Total foundation support does not exceed $4,000,000 annually. The total spent by all medical schools, net after balancing gross operations, is about $25,000,000 annually. H. G. Weiskotten reports that 10 of the approved medical colleges contribute less than 50 cents from non-student sources for every dollar paid in tuition by students; 15 additional schools provide less than dollar for dollar; the remainder match each student dollar with one or more derived from endowment, gift, or tax sources. Only 18 schools provide two or more dollars for each student dollar; the average for the country is less than two.

Selection and Admission.—A Committee on Personnel Practices of the Association of American Medical Colleges has been charged with the duty of evaluating existing tests used to determine the fitness of applicants for admission to medical schools and to develop a test valuable to all medical schools. The Carnegie Graduate Record Examination Board gave a test examination for the Association in January 1947 to approximately 14,500 students. Results have been sent to all member medical colleges. The Carnegie Board will hold similar examinations in 1948 and 1949, by which time the Committee will have developed a test of its own. Dewey Stuit, of the psychology department of the State University of Iowa, directs the study. The American Medical Association announced that 60 per cent of the 4,666 students selected to enter medical schools and schools of basic sciences in the United States for 1946 were veterans and that 1,079 remained to be selected at that time.

Curriculums.—A temporary committee of the Council on Medical Education and Hospitals of the American Medical Association was appointed in June 1947, to plan a survey of medical schools. The committee is to make a study of the block plan, overlapping in course offerings, and of practices in integration and correlation. The Committee on Medicine and the Changing Order of the New York Academy of Medicine, consisting of 48 laymen and experts from the fields of medicine, dentistry, and nursing have examined every phase of the current medical situation, including medical education and research. Representatives of 14 medical schools and of the National Research Council met recently with the National Advisory Cancer Council to discuss the place of cancer in the medical school curriculum. In September 1947 the Yale University School of Medicine established a graduate course in hospital administration leading to the master's degree after a minimum training of 21 months. Washington University has announced a similar program. Both are supported by W. K. Kellogg Foundation Grants. Forty-three medical schools have announced the establishment of Medical Reserve Officers' Training Corps programs. The voluntary training consists of one hour of lecture each week. The Army Medical Department's plan for peacetime operations requires that medical Reserve Officers' Training Corps units totaling 8000 students be established and operated at 66 medical schools which are approved by the Council on Medical Education and Hospitals of the American Medical Association. These units should produce about 2,000 first lieutenants for the Medical Reserve Corps annually. The Inter-Departmental Committee, composed of representatives of the War and Navy Departments, Veterans' Administration, and the United States Public Health Service met with the Association of American Medical Colleges in 1947, to plan the establishment of a Medical Film Institute which will serve as a coordinating agency in the development of audiovisual aids which find a common area of acceptance in the curriculums of the medical schools. The combined budget of the groups is in excess of $3,000,000 annually.

Grants, Awards, and Fellowships.—Several medical schools have announced W. K. Kellogg Foundation Grants. More than $500,000 for research in heart disease will go to colleges, hospitals, and students in the United States and Canada from the Life Insurance Medical Research Fund. Listed are 48 separate grants-in-aid. The Women's Medical Association offered a Mary Putnam Jacobi Fellowship of $1,000 for medical research for the year 1947, to be awarded to a woman doctor either American or foreign. Mississippi, Indiana, and Kentucky are making awards to students who will train for practice in rural sections of their states. Charles A. Doan reported that, as of October 1946, only seven colleges had made any of the 23 Undergraduate Research Awards available to them. Cancer research came in for its share of support during 1947, as did infantile paralysis. Several schools reported grants from the United States Public Health Service.

The Committee on Fellowships and Awards of the American College of Physicians awarded five additional research fellowships in medicine for the year beginning July 1, 1947. The extensive library of 22,000 titles of the late Dr. Arnold C. Klebs of Nyon, Switzerland, has been delivered to the Yale Medical library. Dr. Hans Lowenbach of Duke University has returned from occupied Germany, where he gathered manuscripts on medical and related research that had remained unpublished during the war.

Microfilmed, the 25,000 pages of original manuscripts are being catalogued and abstracted for distribution through the Publications Board, Department of Commerce, Washington, D. C.

NURSING EDUCATION

Enrollments and Scope.—Students admitted to state-accredited schools of nursing for 1946 numbered 30,899. There are approximately 1,300 registered schools of nursing ranging in enrollment from 10 to 900. Fifty-three of the 77 schools which are integral parts of a college or university have membership in the Association of Collegiate Schools of Nursing. Thirty-two are members of the National Organization of Public Health Nurses.

Organization and Control.—The Department of Studies of the National League of Nursing Education reports that the organization of 1,214 of the 1,271 state-accredited schools of nursing in the United States is as follows: hospital control, 1,101, or 91 per cent; university or college control 78, or 6 per cent; joint college and hospital control, 8, or less than one per cent; independent control, 13, or 1 per cent, and other types of control, approximately one per cent. Every state, except Nevada, has one or more state-accredited schools of nursing; yet in 15 states no school is organized and controlled by a university or college.

Background Training.—In April, 1947 the Department of Studies revealed that only 11 per cent of all students then in first-year nursing had one or more years of pre-nursing college work. Of 24,900 working for a diploma in 1946, 91 per cent had not gone beyond high school.

Curriculums.—During 1946, 1,527 nurses were working for degrees in 63 schools. Of 1,101 hospital-controlled schools, all except one offered basic professional programs leading to a diploma, the one providing for a combined degree program; 91 per cent had an arrangement with some college or university for a combined program leading to a degree. Some colleges made provisions for dual enrollment in the school of nursing and another school within the institution, granting two degrees upon graduation. New fields are opening up in the profession. Wayne University has established a practical one-year training program for industrial nurses open only to registered nurses. Ohio State University, Catholic University of America, and the Arkansas schools of nursing are offering courses in psychiatric nursing; men are being encouraged to enter this phase of nursing. Since March 1947 the University of Chicago has offered a six-months advanced course for both public health and institutional nurses in obstetric nursing and in nursing care of children. Other new or reconstructed programs include: a five-year program of the Harris College of Nursing in cooperation with Harris Memorial College and Texas Christian College; the University of California, with the organization of a Department of Nursing Education; the University of Minnesota, with an additional four-quarter program leading to a certificate in practical nursing; Western Reserve, with a special curriculum in advanced tuberculosis nursing for Veterans' Administration nurses exclusively; Teachers College, Columbia University, in cooperation with Memorial Hospital, New York, opening a two-semester program for cancer nursing for which scholarships are available; and the Syracuse University Department of Public Health Nursing and Tri-Boro Hospital School of Nursing, New York City Department of Hospitals, offering four courses in tuberculosis nursing for public health nursing supervisors.

Scholarships, Grants, and Fees.—The United States Public Health Service made grants to nine institutions for the preparation of staff personnel for psychiatric nursing and mental hygiene, for strengthening and expanding advanced programs, and for stipends for postgraduate students. Schools of nursing on Long Island, New York, have $15,000 available for scholarships and loans. Boston University, the University of

Minnesota, and the University of Pennsylvania received Kellogg Foundation grants in order to expand the educational opportunities for graduate nurses.

Of 1,152 schools, 69 per cent charge tuition fees for nursing education. Median tuition for courses is $218 including all expenses; fees for nursing education range from $30 to $1,000. Eighteen schools charge more than $600, and nine university-controlled schools charge over $1,000 for tuition.

PHARMACEUTICAL EDUCATION

Supply of Pharmacists.—There are 70 schools of pharmacy in the United States, 67 accredited by the American Association of Colleges of Pharmacy. In some states pharmaceutical education is almost entirely dependent upon student fees and tuition. It appears that there will be little chance of relieving the shortage of registered pharmacists until late in 1950. In the immediate period preceding 1943, approximately 2,300 pharmacists graduated and were licensed for practice, annually; in 1944, 1,100 licenses were issued, and in 1945 only 800. The estimated number of new graduates in 1946 was 500, and in 1947 1,300. For the four-year period from 1943-1947, there is an estimated shortage of 5,500 registered pharmacists. According to the Committee on Limitation of Enrollment of the American Pharmaceutical Association, the number of graduates in pharmacy will be approximately 200 in 1948, 4,500 in 1949, and 5,500 in 1950. The total number of graduates in the three years, 1948 to 1950, inclusive, will reach 12,000, an excess of 5,100 over the three-year average for the immediate pre-war period. While this will not balance the shortage built up previously, continued large enrollments with colleges graduating more than 5,000 pharmacists, annually, after 1950 may result in an oversupply of recruits. The Committee estimated that not more than 3,500 pharmacists will be needed as new registrants each year after 1950, even with expansion of government demand. It recommended immediate planning for more rigid selection for pharmaceutical education.

Curriculums.—Planning for the Pharmaceutical Survey, directed by Edward C. Elliott and financed by the American Foundation for Pharmaceutical Education at the request of the American Association of Colleges of Pharmacy, is still in progress. Their work in 1947 represents the first major step in the formulation of major policies by the profession. In addition, they are working with the Committee on Personnel in efforts to improve the quality and quantity of instruction at the graduate level. The establishment of new schools of pharmacy is being discouraged except where there is real need for them. The committees secured and distributed data on the faculties of colleges of pharmacy covering degrees obtained, provisions for sabbatical leave, and tenure policies. They recommended that at least four persons with doctor's degrees in pharmacy be employed in each school of pharmacy.

Among 45 deans of colleges of pharmacy responding to a questionnaire sent out by the committees in 1947, responses were as follows: 24 reported that they offer graduate instruction leading to advanced degrees; 21 reported no intention of offering graduate instruction leading to the Ph.D. degree within the next five years; and only four intend to initiate graduate programs leading to the master's degree in one or more major fields of pharmacy. The number of schools offering the Ph.D. degree in specific areas are: Pharmacy 3; Pharmaceutical Chemistry 11; Pharmacology 6; and Pharmacognosy 8. The master's degree is offered in the following number of schools in each area: Pharmacy 20; Pharmaceutical Chemistry 23; Pharmacology 15; and Pharmacognosy 14. Only five offer graduate instruction leading to both the Ph.D. and master's degree in all four of the major fields. The number of schools reporting intentions of initiating graduate instruction for advanced degrees in areas not now offered is as follows: Pharmacy, 6;

Pharmaceutical Chemistry, 4; Pharmacology, 4; and Pharmacognosy, 2. The number indicating the intention to offer the master's degree in each area is: Pharmacy, 6; Pharmaceutical Chemistry, 2; Pharmacology, 2; and Pharmacognosy, 3.

Approximately 200 graduate students were enrolled in pharmacy in September, 1946. The trend is for schools which now offer graduate instruction in one or more major fields to broaden their existing facilities to include other fields. It is estimated that schools of pharmacy offering courses toward advanced degrees will be able to accommodate some 265 advanced students under present conditions and approximately 480 graduate students in 1951. The Five-Year Curriculum Committee reports that less than 10 per cent of the deans of schools of pharmacy favor a five-year curriculum effective by 1950 with one year of pre-pharmacy and changes in state laws requiring five years of college work for licensure; less than 25 per cent favor lengthening the training program. An alternative five-year curriculum in pharmacy is announced by Western Reserve University. The new plan permits the acceptance of more students since those in the five-year program do not require the facilities of the School of Pharmacy until two years of pre-pharmacy work are completed.

Awards, Fellowships, and Grants.—In May 1947 the Foundation Board of Grants renewed fellowship awards for nine students engaged in graduate work leading to the Ph.D. degree and allocated 22 new awards to students working for this degree. It also provides $50,000 for awards for the current year and $50,000 for strengthening graduate instruction. Grants will provide needed personnel for college staffs and for research in laboratories of pharmaceutical manufacturers. Twenty-five thousand dollars is provided for undergraduate scholarships. The Women's Auxiliary student loan fund of approximately $4,000 is available to deserving women students of pharmacy.

The American Pharmaceutical Association is planning a Pharmaceutical World Congress for 1952 which will include a discussion of educational problems.

EDUCATION FOR SOCIAL WORK

Enrollments and Scope.—In 1947 the American Association of Schools of Social Work reported 47 member schools, 39 offering a two-year program leading to a professional master's degree while eight offer the first year of a two-year program. Fifteen are affiliated with state or territorial universities or colleges, seven are under religious auspices, three are in Canada, one in Hawaii, and two, Atlanta and Howard, are for Negro students. Tuition varies from $110 to $600 a year. The number of full-time students specializing in social work increased from 4,715 in 1944 to 5,011 in 1945. During the fall quarter of 1946 only eight schools reported having more than 100 full-time students each, the enrollment at any one time being affected by the availability of field-work facilities and the pressure of employment opportunities.

Curriculums.—In 1946 the American Association of Schools of Social Work and the National Association of Schools of Social Administration accepted a plan for the establishment of a National Council on Education for Social Work (1) to establish a temporary commission on education for social work, representative of the fields of education, practice, and related interests, to make a long-range study of the content and methods of graduate and undergraduate education for social work and the extent to which each prepares for the needs of the field, (2) to agree upon the content of education for social work for accrediting purposes, (3) to establish machinery for continuous collection of data on personnel needs in social work and on the quantity and distribution of educational facilities, and (4) to provide machinery for the discussion of common educational problems. Among the factors affecting the curriculums in social work are those related to emphasis on mental hygiene, psychiatry and psychoanalysis, public health and medicine; labor; services to a displaced population in a post-war economy; protective programs of social security and social insurance; and intercultural and interracial progress. There is a trend toward emphasizing social work as a service to people in every social and economic group rather than to such specific ones as "the aged" and "the delinquent." A need is expressed for the education of persons to teach in schools of social work. The doctorate in this field has been established in a few schools. A graduate school of Social Work was to be established at the University of Alabama in 1947 with adequate clinical facilities available through the medical college.

Research, Scholarships, and Fellowships.—The American Foundations for Social Welfare lists some 500 American foundations which conduct or make grants for research in fields of work, the most important among them being the Russell Sage Foundation and the Social Science Research Council. The 1947 *Social Work Yearbook* reports a total of 1,431 students receiving scholarship assistance, including 83 on work-study fellowships, 287 on educational leave fellowships, and 499 on recruiting fellowships.

TEACHER EDUCATION

Shortage of Teachers.—The deep concern for securing a sufficient number of adequately prepared teachers to meet the needs of the schools, which had arisen in previous years, continued in 1947. Virtually all groups engaged in teacher education gave the matter of teacher shortage major attention. The number of emergency certificates issued in 1945-46 was 108,932 as compared with 2,305 in 1940-41. Benjamin Fine estimated that this number had increased to 125,000 for the year 1946-47, or one for every seventh teacher. He further reported that in 1947, 60,000 teachers had a high school education or less, and that the average teacher in the United States in 1947 had one year less of education than did the average teacher in 1939.

Although enrollments in teachers colleges increased 13 per cent in the autumn of 1946, large proportions of students enrolling in teachers colleges were in non-teaching curriculums, and a significant number of graduates of teaching curriculums went into non-teaching vocations. The proportion of all college students going into teacher education was 7 per cent in 1947, as compared with 22 per cent in 1920. Only 20,000 of the million veterans enrolled in higher education institutions in 1946-47 were in teachers colleges.

In a survey of teacher education enrollments in the 20 states covered by the North Central Association of Colleges and Secondary Schools, Ray Maul found that the production of elementary school teachers in 1947 was less than half as great as in 1941; in the high school field the proportion was 75 per cent. He reported practically no gain in the production of elementary school teachers and in certain high school areas, whereas in other high school teaching fields the shortage of candidates holding standard certificates is almost over. He estimated that there will be a continuing shortage of college teachers in the next several years, so great that standards in the employment of college teachers will be lowered. The number of elementary school teachers employed in the United States probably will increase almost one-third within the next five or six years owing to the great increases in the number of births occurring during the years subsequent to 1940. This situation will further accentuate the shortage of elementary school teachers.

The United States Office of Education has prepared a recruiting information manual for prospective teachers. The National Education Association has given much effort to attacking the problem of getting more and better qualified teachers in the schools. This Association recommends scholarships for teacher education, direct attack upon reducing the number of emergency certificates as rapidly as possible, the promotion of in-service training, particularly of undertrained teachers, and improvement of conditions of teaching, especially of salaries and sick leave provisions.

Improvement of Curriculum.—A study of general education in the four-year curriculums for elementary school teachers has been completed by Warren Lovinger under the sponsorship of the Committee on Standards and Surveys of the American Association of Teachers Colleges. It was found that the average general education requirement in the 127 teachers colleges studied was 48 semester hours. The Committee on Student Teaching of the Association is making an extensive detailed questionnaire study of student teaching policies and practice. The Committee on Standards and Surveys of the Association is giving attention to the following areas; applied economics, work experience, general education, conservation education, international education, health education, religious practices in teacher education, library standards, standards for laboratories and shops, student personnel services, scholarships, and salaries and promotions.

The Council on Cooperation in Teacher Education.—The Council on Cooperation in Teacher Education, an organization whose membership consists of representatives from a large number of organizations interested in teacher education, has shown much interest in international aspects of teacher education during the past year. It sponsored the National Clinic on Teacher Education held in Georgia in late 1946 with the aid of a contribution of $6,500 from the Julius Rosenwald Fund. This clinic, which lasted for a week, was an effort to study and evaluate, cooperatively, a number of phases of the teacher education program in Georgia. Participants included 170 persons from 34 outside states and 100 Georgians.

VETERINARY MEDICAL EDUCATION

Employment.—There are approximately 12,000 veterinarians in the United States, nearly 60 per cent of whom engage in private practice. Approximately 1300 are employed by the United States Department of Agriculture.

Curriculums.—Curriculums which meet the American Veterinary Medical Association standards are offered by 10 schools in the United States and 2 in Canada. They are supported by public monies and most are connected with state universities or technical colleges. Courses are not standardized but certain minimum requirements are set by the Association. Some new schools are requiring two years of pre-veterinary study.

Fellowships and Other Research Opportunities.—The Schenley Research Institute established post-doctorate research fellowships totaling $110,000 at the University of Wisconsin for the study of factors affecting the production of antibiotics and the relation of veterinary services to public health. The Research Fund being raised by the Special Committee on Financing Research of the American Veterinary Medical Association, to advance knowledge in both basic and applied aspects of veterinary science, will establish fellowships in the United States and Canada which will lead to teaching research. Stipends will range from $150 a month, upwards. A graduate teaching and research center was authorized in August 1947 for the College of Veterinary Medicine of the University of Illinois. It has been written into Army Regulation No. 40-410 that the Army Institute of Pathology is open to veterinary officers as well as medical and dental personnel.

ADULT EDUCATION

By J. O. Keller and H. G. Pyle
The Pennsylvania State College

GENERAL

The adult education program continued its growth, making wide gains during 1947. It persists in being characterized by a great diversity of aims, programs and objectives as well as a lack of integration. Standardization and a measure of program unity may come if and when public funds support the movement, or when further professionalizing of the adult educator takes place, but efforts in this direction can tend to make this movement sterile. Professional organizations in adult education took cognizance of the need for definition of policies, principles, and practices when a joint committee composed of representatives of five national organizations studied and reported on the "chief problems confronting adult education" (*Adult Education Journal,* April 1947, p. 85).

Many conferences were held during the year to scrutinize the movement. The National University Extension Association met immediately preceding its annual conference to study the aims and objectives of college and university extension. The Department of Adult Education (National Education Association) called a first annual meeting of city directors of adult education at Battle Creek, Mich., a part of which session was held jointly with the second annual conference of state directors of adult education. The American Association for Adult Education held its 22nd annual meeting at West Point, central theme of which was the problems of adult education within the community.

Community aspects of adult education were further emphasized by a National Conference on the Community held later at West Point in October. This group, called together by the National Planning Association, was chiefly interested in integrated services to over-all community organizations. A follow-up conference in Washington in November considered a permanent organization of agencies concerned with adult education and over-all community development. In New York State at Manlius, a ten-day Institute on Community Leadership took place and a great many states held similar study projects on this aspect of adult education.

The California State Education Department materially expanded its in-service training program for teachers and leaders of adults. New York State continued its seven-year program of try-out and demonstration projects, promotion, and research in adult education with a $120,000 legislative grant for an expanded bureau of adult education with 15 staff members. Baltimore, under National Education Association auspices, held a unique work-survey conference designed to evaluate the total community program. Conference planning and procedure itself was subjected to intensive study at a three-weeks national workshop or laboratory in group development held at Bethel, Me.

Schools of education scheduled more professional training in adult education. In 1945, 20 summer schools gave 30 courses; in 1947, 34 summer schools gave 70 courses. California agencies of adult education held a two-weeks community leadership training workshop in Santa Barbara.

Many adult education programs during the year were designed to promote international and intercultural understanding. The broader economic and social objectives of UNESCO must lean heavily on adult education agencies for their achievement. In fact, the U. S. National Commission for UNESCO recommended a "conference of experts on the contribution of adult education to peace and security to be held by UNESCO in 1948."

At least two recent studies or polls, one nationwide, show approximately one adult in every three continually instructed in one project or another in organized adult education. The estimate includes education for veterans, workers, rural population, and extension activities of colleges and universities. Analysis shows adults seeking continuing education at present for improvement of job status, to increase status by self-improvement, training in family life, training in leisure time and recreation, and education in the social sciences. Interest manifested in community welfare is motivated by realization that good personalities, good jobs, good families, depend inevitably on healthy communities. Malcolm MacLean (*Survey Graphic,* November 1947, Page 606) finds these significant current developments bearing on the processes of adult education: (1) research in public opinion is developing techniques to tap swiftly community thinking and feeling. In fact, experiments give reason to believe that we may learn how adults "think and feel as they do, whether opinions are shaped by emotion or reason, by knowledge or ignorance"; (2) there is widespread research into the effectiveness of mass media of communication in shaping opinion; and (3) intensive studies are going on, notably in Massachusetts Institute of Technology, as to what happens to individuals in classes, committees, conferences, forums, and the like.

Possible blocks to the extension of these developments MacLean lists as: (1) attempts at thought control or to limit freedom of discussion; (2) lack of funds for research into the processes of adult education; (3) lack of competent leaders and teachers; (4) lack of knowledge of the adult learning process, (yet, a century ago there were 800 adults to every 1,000 persons under 21 years of age; today, we have 2,000 adults to every 1,000 minors); (5) lack of buildings and equipment; (6) too much of the wrong kind of materials; and (7) lack of finances. Growth of adult education during 1947 could be said to be characterized by all of these aspects.

MUSEUMS AND SCIENTIFIC ORGANIZATIONS

These agencies found it imperative to demonstrate the importance of the educational facilities they have at their command to the community. If for no other reason, community services of one type or another become necessary in order to bring financial support to museums, art galleries, and other depositories of art. In line with this principle, many activities such as the following took place in 1947.

The Addison Gallery of American Art at Phillips Andover Academy installed exhibits of historical and modern fabrics in four textile mills in the Andover (Mass.) area. The division of adult education of the Buffalo Museum of Science offered a program of 39 courses for adults in its spring semester cosponsored by the Board of Education. This museum also carried on a radio program of museum highlights to stimulate popular interest in its collection. Other museums arranging such broadcasts included the City Art Museum of St. Louis, Cleveland Health Museum, Detroit Historical Society, Franklin Institute (Phila.), National Gallery of Art (Washington, D. C.), New York Botanical Gardens, Virginia Museum of Fine Arts, Chicago Historical Society, Children's Museum (Washington, D. C.), Columbus Gallery of Fine Arts cooperating with the Ohio State University, Illinois Historical Society, Missouri Historical Society, Oglebay Institute (Wheeling, W. Va.).

The National Gallery of Art inaugurated a series of film and music lectures. A costume institute was organized by the Metropolitan Museum of Art which illustrated three centuries of fashions.

At the Philadelphia meeting of UNESCO in March, a sectional meeting dealing with the work of museums took place and the sub-committee on libraries and museums of UNESCO reported in Paris in December recommending establishment of formal relations with the new International Council of Museums.

The Rochester Museum of Arts and Sciences offered a course in sources of local history for amateur historians. The Art Alliance of Philadelphia arranged for musical recitals. The Washington Children's Museum put a Trailer Coach International Exhibit on the road for a first tour through eight states. The Boston Museum of Fine Arts presented a concert and lecture series correlating music and art. The Dayton Art Institute cooperated with the Chamber of Commerce in sponsoring a series of free Sunday musicales. The Museum of New Mexico arranged a concert tour for the state.

REGIONAL, STATE, AND LOCAL COUNCILS

Community programs of adult education are probably best promoted through regional, state, and local councils. Their endeavor can bring cross-sectional action representing the interests and activities of a variety of agencies and functional groups. All of these agencies continue to indicate increasing need for leaders trained in modern adult education methods and skills in order effectively to equip people for jobs in the community. Probably the best directory of state and local councils is to be found in the February issue of the *Intercouncil Newsletter* of the American Association for Adult Education in which approximately half of the 48 states are represented.

The sixth annual southeastern regional conference on adult education devoted its program to the theme, "Progress in Adult Education in the South." In a sizable catalog entitled "Educational Opportunities of Greater Boston for Adults," one can learn of such opportunities in that area. The Council of Greater Boston continues its study of adult education needs and trends. The Des Moines Adult Education Council has completed a survey of adult education activities. The Baltimore Adult Activities Council has developed a number of local neighborhood councils and the same development has taken place in Philadelphia. The Adult Education Council of Denver held a Mountain Plains Conference in the fall. A Missouri Valley Conference on adult education was held in Omaha (Neb.). The New York City Adult Education Council published an interesting report on the story of a discussion program which involved veterans and citizens.

A National Conference on Adult Education and the Negro was held in Atlantic City in March. The California University Extension Division conducted workshops on community leadership training and on counselling older-aged adults. The American Association for Adult Education set a committee to work on principles of community organization. Philadelphia started its seventh successful year for its adult education school, the "Junto." The Adult Education Council of Chicago had a report of its program policy committee recommending activities for the atomic age; the narrowing of the gap between the council and practitioners; a study of Chicago's needs; and a factual study of programs now carried on to meet these needs.

LIBRARY SERVICE

The library, as an active educational agency of the community, has broadened its function to include a sponsorship of adult study groups and activities which may or may not involve the use of the printed page such as lectures, film forums, concerts, and informal discussions. The adult education board of the American Library Association indicates a two-fold program carried on in 1947. One is concerned with the development of resources for aids to community groups with materials, planning and consultation assistance. The second is associated with programs initiated and developed by libraries themselves. (See "Libraries," in this volume.)

HEALTH, SAFETY, AND PUBLIC WELFARE

Many organizations work to educate for better health, safety, and public welfare. Typical of the activities of these organizations is the following record of service in 1947.

The National Recreation Association serving over 6,000 communities a year, reports a rapid increase in interest and activity on the part of state government agencies in providing recreation services. Thirty-nine states in all have provided some type of state service to communities on their local recreation problems. These services range from fulltime field consultation service to help on specific activities such as music, drama, arts and crafts. In the field of rural and small town recreation, at least one state agricultural extension worker in each of 33 states devoted time to help train local recreational leaders. In 18 states, there were fulltime recreation specialists.

Greater concern for the problem of recreation for older adults was also in evidence during the year. Youth center activities were developed with youth having a greater part in the planning and conducting of activities. This trend has been given added impetus, with the return of veterans to their home neighborhoods, as a result of their exposure to these activities in the armed forces. The Association also reports that, in 1947, there were greater local provisions for physical activities such as instrumental and vocal music, dramatics, arts, and crafts, hobbies, interest in programs and projects such as folk festivals which promoted intercultural understanding.

The adult education activities of the National Safety Council were impressive. That agency spearheads the accident prevention program in the United States and its 35th National Safety Congress held in Chicago brought together 10,000 persons in the 140 sessions devoted to industrial, traffic, farm, home, and other phases of safety.

A National Farm Safety Week was proclaimed by President Truman in July which mobilized state farm agencies, the farm press, radio networks, and others for an attack on this problem.

The contribution of the American Red Cross to adult education is chiefly in the field of health and safety. Some 31,600 instructors issued 346,871 first aid certificates during the year. In the same time, 470,390 water safety certificates were issued, and 31,723 persons completed accident prevention courses. The Red Cross is developing new teaching materials and utilizes a wide variety of publicity and other media. Leaflets dealing with nutrition and special instruction to volunteers working in hospitals are other phases of the program of this agency.

The U. S. Children's Bureau of the Federal Security Agency promotes parent education by cooperating with other national and state agencies and issuing booklets for distribution. There were 1,800,000 copies of the pamphlet "Infant Care" distributed in 1947. Many other bulletins are issued dealing with child and family welfare. The Children's Bureau and the Public Health Service analyzed data gathered by 2,000 persons on child health services in 1947 in preparation for its presentation before a meeting of the American Academy of Pediatrics in December. The Children's Bureau in 1947 issued a number of publications of special interest to groups which planned community programs for children and youth.

INDUSTRIAL RELATIONS AND LABOR EDUCATION

The universities offering extension work in the field of industrial relations such as Cornell, Illinois, Penn State, Wisconsin, California, Minnesota, experienced greater demands for their programs. They experimented with the possibilities of having representatives of both groups meet jointly and compared results with the arrangement under which representatives of labor and of management met in separate group sessions. The new state-created institute of management and labor relations at Rutgers University got under way with forums, institutes, film forums and group sessions arranged for labor, management and public groups in the state.

Great need continues to exist for leadership training projects in the field of labor education and certain universities again discussed plans for such courses. The Pennsylvania State College conducted a series of one-week labor institutes for the United Steelworkers of America for the second year, and similar institutes were held at the universities of New Hampshire, Michigan, Illinois, Indiana, Wisconsin, California, and Kansas, and at Antioch College.

The educational department of the Ladies Garment Workers Union issued a biennial report showing almost 9,000 enrollees in 300 classes and groups for 1945-46. In addition to classroom events, innumerable cultural and recreational projects have been in operation reflecting the continued trend away from formalized education toward varied activities which escape statistical record.

Six educational institutions in the eastern part of the United States cooperated in the summer with the Textile Workers Union (C.I.O.) in making facilities available for eight training institutes for local plant leaders. Harvard University had a registration of ten selected labor fellows for a special nine-months course.

The American Labor Education Service cooperated with universities in workers education and carried on leadership training projects and services attended by teachers, librarians, group workers and graduate students. An experimental program was continued in the field of group tensions and intolerance. Counseling and advisory services were given to educational directors of unions with bibliographical services and other helpful materials provided. A.L.E.S. also carried on its eighth annual Midwest Workers' Education Conference; its second Northwest Farmers and Workers Education Conference; and its Summer School for Office Workers at Lake Forest (Ill.).

The Workers Education Bureau of America carried on a broad program of labor institutes and conferences in cooperation with state federations of labor, city central bodies, and state universities and other educational institutions. Among institutes held during the year were those in Colorado, New Jersey, Massachusetts, Montana, New York City, Cornell, Ohio, Kansas, and elsewhere. Several publications were issued by the Bureau during the year in addition to its monthly *News Letter*.

The Division of Labor Standards of the Department of Labor sponsored a labor education conference which dealt largely with the extent and status of university labor education programs throughout the country. Operations of industrial relations centers were considered as was also the work of various extension services and discussion concerned itself with administration of these programs, course content, teaching staff, materials, and other resources.

RELIGIOUS EDUCATION

Some adult educators believe that areas currently important for the church are racial tolerance, housing, labor, and recreation as it relates to the juvenile delinquent problem. They believe furthermore that the churches must help in creating an awareness to social problems in the community and that churches must work cooperatively with other local organizations for effective adult education programs.

The Federal Council of Churches of Christ in America is an agency of adult education but actual organization of educational programs rests with the denominations working with the International Council of Religious Education. Three items of special significance in the work of the Council in 1947 were: (1) extended program development in the field of Christian family education; (2) unification of elective study planning with studies related to every phase of life in which adults are engaged; and (3) sponsorship of a national conference on the community and religious education.

The work of one other representative agency in this field might also be outlined. The National Catholic Welfare Conference notes that a growing consciousness of each individual's responsibility in social and political life has marked the adult education program of the Conference during 1947. Conferences on industrial problems, on family life, on youth; institutes on social action and on the United Nations; seminars on the problems of minority groups; and established radio programs have been sponsored by the various departments and bureaus of the Conference. (See "The Roman Catholic Church," in this volume.)

MEN'S AND WOMEN'S CIVIC AND SOCIAL CLUBS

Rotary, Kiwanis, and the Lions Clubs plan their programs for business and professional men. The 65-year old American Association of University Women now numbers over 1,000 branches with a total membership of 90,000 college alumnae. Through its study-action and other programs, it works in connection with legislation affecting women, on equal opportunities for women, on representation of women in public service, for better schools, for the better understanding of international relations, and similar problems of social worth. In 1947, the organization worked for promotion of UNESCO and for the Commission for International Educational Reconstruction.

The Congress of Parents and Teachers carried on in behalf of the welfare of the nation's schools, each unit composed of both men and women being active in their own individual localities. A great many agencies also worked in behalf of family life education, including the National Conference on Family Relations.

The 72,000 members of the League of Women Voters worked in 550 communities to promote political responsibility through informed and active participation of citizens in government. Its program in 1947 included providing of information, building public opinion, and supporting legislation. The General Federation of Women's Clubs with its membership of 3,000,000 women and 16,500 clubs furthered its objectives of promoting education, philanthropy, public welfare, moral values, civics, and fine arts.

UNIVERSITY EXTENSION

The Carnegie Corporation, in 1947, gave the University of Minnesota $5,000 for the support of summer institutes for extension workers for a three-year period to be carried on under the auspices of the National University Extension Association. The year's institute dealt with extension teaching methods; institutes and short courses; and use of audio-visual materials in adult education. This effort represents a significant step in leadership training. Generally, college and university extension programs recorded large advances, particularly in projects designed to meet the demands of service personnel for higher learning. The Veterans Administration late in the year announced that 60 colleges and universities spread from Florida to Washington State had contracted with it to offer correspondence courses under the G. I. Bill. The following projects illustrate the diversity of college and university offerings.

The division of adult education and extension services of the University of Washington reports its forum program so successful as to have become an integral part of the cultural life of many communities. An office of lectures and concerts is headed by a full-time administrator. The University in cooperation with the State College and General Electric Company, is offering a credit extension class program in Richland (Wash.), one of the important centers in the Atomic Energy Commission's program.

The University of North Carolina operates 12 college centers at the first-year level for both veterans and non-veterans. The extension program is outlined in "University Extension in Action" by the director of the division, published in 1946. A Communications Center established at the University, to serve the state, contemplates additions in the form of television apparatus and an FM radio station. The extension division at the University of Connecticut sees an enlarged demand for courses in effective living, community leadership and in-service growth courses for teachers. The University of Wisconsin notes two developments: (1) an expanded program over the state in workers education in 12 cities; and (2) an intensification of general programs in the adult education field—programs involving institutes, lecture series, and short courses.

The Pennsylvania State College extension service leased from Swarthmore College the former administration building of the Mary Lyon School. It houses a center for 275 college freshmen, a daytime and evening technical institute, a guidance and counseling center, and special institutes and short courses for the Philadelphia area. This center is in addition to several other centers where the first and second years of college instruction are offered, and to 15 technical institute centers where non-credit evening instruction of college grade is also available.

The public service division of Montana State University is a unit coordinating all off-campus activities such as adult education, correspondence study, radio, news service, publications and alumni relations. The program featured literary study groups, forums, a course in conservation of human and natural resources, a cooperative School of Public Administration for the Forest Service, a musical concert tour, and a project working toward joint action for community betterment. University extension at the University of Kansas featured short courses for court reporters, bank management, insurance underwriters, and Steelworkers. Effort specifically is made to tie in radio, correspondence instruction and visual aids with classes, institutes, conferences and workshops. Columbia University established a school of general studies separate from its institute of arts and sciences.

Harvard University, acting through its commission on extension courses, sponsored 29 courses in 1947. Princeton University established a modest program of extension courses during the year, and Johns Hopkins University established its McCoy College for adult instruction. The extension service of the University of Alabama presents an imposing record of activities including the following: some 12 seminars throughout the state on current affairs; encouragement of communities to establish and maintain public forums; assisting communities in the state to carry on industrial surveys for community development; the carrying on of a series of short courses and institutes; maintaining regular educational radio programs; an educational materials loan service; institutes on home and family life in six or eight communities; an advisory and training service for newspaper publishers; and four resident centers of instruction.

The extension division of Ohio University notes especially a four-year apprentice program in engineering drafting established for an industrial concern and the participation of the institution in an experimental state program of health education subsidized by a grant from the Kellogg Foundation. The division of academic extension at the University of Delaware this year carried on 40 off-campus courses chiefly in the city of Wilmington.

The extension division at the University of Tennessee notes as one of the most significant tendencies of the year the interest in adult forums on international affairs. Twenty-five hundred persons attended eight leadership conferences on the subject "Facing Atomic Energy." Seventy-five other forum sessions developed from this initial project. There is also increased demand for college and non-college credit training with five new university centers established in the state.

The extension division of the University of Arizona notes 100 per cent increase in students in both class and correspondence instruction since 1941-42. The extension division of the University of Nebraska reports a second institute on small community life. Interest in art throughout the state increased and a labor college is planned for early 1948.

North Dakota Agricultural College marks an increased call for motion pictures by churches and adult groups with greater enrollment in correspondence courses for veterans and teachers. The extension division of the University of Hawaii notes that civilian registrations for its activities are as large as the very sizable registration of servicemen during the war. A special course on Russia features lectures, discussions and Soviet-made films and attracts much interest. An extension college offering day credit courses has also been established. The extension division at the University of Iowa has an enlarged program of professional refresher short courses. The conferences on the campus for many adult groups, curtailed during the war, were started again in 1947.

The extension division of the University of Texas notes as the most significant development there the fact that the American Oil Drillers Association granted it a fund to extend into other oil producing states their training program in the chemistry of oil drilling muds; also the American Petroleum Institute granted a fund to make a survey of the training program in the oil refining division of the American Petroleum Institute.

The university extension service at the University of California features a highly specialized organization set up with close liaison with many areas of instruction. A program of continuing education for the California Bar Association was established in 1947. An adult education specialist was appointed to the staff to give sole attention to the improvement of quality of the various instruction activities. Close cooperation is maintained with public school programs of adult education and also with the public junior colleges of the state, with the University frequently arranging extension courses for the third year of college level work.

The division of general college extension at Rhode Island State College shows an increasing interest in adult education evidenced not only by higher enrollments, but by support of the extension program by business, professional and labor groups in the state. The general extension division at the University of Florida conducted eight child guidance and counseling institutes affecting more than 100 Florida high schools. The extension division of the University of West Virginia found increased requests for in-service training programs for teachers. The department of educational field services at the University of Idaho represents a new consolidation of field services of the University. The University of Massachusetts organized an extension service in 1947 to make available to adults the resources of that institution.

The extension service of the University of Michigan finds great interest in classes dealing with human relationships—in the home, on the job, and in the community. The University cooperated with Wayne University in conducting mental hygiene courses for teachers and administrators of elementary schools with 750 persons registered for the first section. Great interest was also manifested in vocational subjects for persons in semi-professional life. Representatives of the Public Health Service worked under university sponsorship with labor groups in the industrial areas about Detroit.

The general extension division of the University of Minnesota finds its center for continuation study being something of a graduate school of adult education presenting non-credit courses for many types of professional workers. During 1947, the center was in operation 891 class days indicating three groups present on the campus each working day. The class program features courses in fashion illustration, current reading and religious classics with one special course dealing with intercultural relations.

The university college of the University of Chicago has had considerable success with its great-books seminars; in fact, they have been used as patterns for similar programs throughout the country. The Great-Books Foundation was organized to undertake this form of adult education separately. Seminars on world politics sponsored jointly by university college and by the Chicago Council on Foreign Relations represented an entirely new adult education activity. Of further significance was an attempt to develop more effective union—university relations with two members of the staff developing programs and projects helpful to unions as a part of the activity of the industrial relations center. Effective discussion guides were developed particularly for the Steelworkers Union.

MASS EDUCATION

C. W. Darden, on the occasion of his inauguration as president of the University of Virginia in October, said: "The most pressing question, however, is what is to be done for the 75% of the high school graduates, to whom I referred earlier, who go from high school not to college but to work. Admittedly there are among them many of demonstrated capacity and of known ambition. They go to work in most cases because they must support themselves and in many instances help support families. Yet, with a free ballot, there rests within their hands the political control of this country. It is reasonable to assume that, given the opportunity, they can supply a larger number of able citizens than are now supplied by the colleges and the universities." The president of the Association for Adult Education, in his presidential address at the annual conference, also pointed out that adult education can not stop short of mass education and that social education must be its working goal.

These statements bear on the influence, in adult education, of mass media such as the press, radio and motion pictures. Is it to some extent a force which tends to destroy social and cultural illiteracy as well as to entertain? It should be appreciated that a large part of the younger population inducted into war service was not mature to the point where it was informed on the very issues for which the men were asked to risk their lives. Does there now exist a social maturity which would help to win and conserve the peace? Another aspect is that mass communication media have multiplied the number and range of facts placed before an individual and the question arises as to the extent to which he can absorb and interpret them. Many educators currently believe that the press, screen and radio have a responsibility for turning these instruments of adult education to making adults adult-minded, rather than keeping a substantial portion of the population in a state of arrested adolescence.

Outstanding programs in the public interest carried by the Mutual Broadcasting System included "American Forum of the Air," "Meet the Press," "Family Theater," "The Veteran Wants to Know," and some few musical programs. The Columbia Broadcasting System carried on some outstanding educational projects. Its "Invitation to Learning" programs which included discussions of significant books; its splendid "American School of the Air," now in its 18th year; its re-creation of major historical events, and others, tended to make its efforts in this respect noteworthy. The National Broadcasting Company established a public affairs board and reorganized its department of public affairs and education.

Two organizations stand out in the promotion of utilization of educational and documentary films. The Educational Film Library association organized in 1943 now has an institutional membership of over 300. The conference held by this group in cooperation with the Institute for Education by Radio in Columbus in April drew an attendance of over 200. The agency is an official member of the National Commission to UNESCO.

A second organization is the Film Council of America, which is an outgrowth of the National 16mm Advisory Committee of the war period. This committee and Council which grew out of it, being formally organized in 1946-47, is an agency formed by seven constituent members: the Allied Non-Theatrical Film Association; American Library Association; Educational Film Library Association; National Association of Visual Education Dealers; National Education Association (DAVI); National University Extension Association; and the Visual Equipment Manufacturers Council. The Film Council is a national organization which promotes local film councils in communities of 5000 or over. At present there are approximately 40 local field councils and the goal for the coming year has been set at 350.

The American Association for Adult Education is also active in the film field with its *Film Forum Review* which is designed to further the use of motion pictures in free discussion.

Late in the year the Navy established a research project at The Pennsylvania State College dealing with the scientific development and effective use of sound motion pictures as teaching media. The two-year project is designed particularly to investigate the problem of effective educational films and to determine what subject matters and themes can be most effectively presented by means of sound films. The speed of learning and the amount of learning which takes place will also be investigated.

PROFESSIONAL ORGANIZATIONS

Best known professional organizations in the field of adult education are the National University Extension Association, American Association for Adult Education, and the Department of Adult Education (N.E.A.). Those interested in examining developments in adult education more intensively or in finding a listing of current publications in the field should turn to the *Adult Education Journal* published by the A.A.A.E. or to the *Adult Education Bulletin* of the N.E.A. Department.

The American Association during 1947 notes as its most important activities: (1) the work of its Committee on Community Organization for Adult Education in preparing some 30 case histories of such activity in 15 states; (2) sponsorship of the *Handbook of Adult Education* to be published in 1948; (3) the sponsorship of the Commission on Motion Pictures in Adult Education; and (4) cooperation with the United States Commission for UNESCO in the collection of information about adult education activities in the United States. The N.E.A. Department is pushing forward in these areas: (1) experimental work in group dynamics and discussion techniques; (2) experiments in planning and conducting conferences, institutes and workshops; (3) encouragement of leadership training programs for lay and professional community leaders; and (4) development of cooperation among regional groups. Its most successful venture in 1947 was the Bethel (Maine) Laboratory on Group Development.

The National University Extension Association is the national agency which represents the adult education activities of colleges and universities. It publishes a *Monthly Bulletin*. U. S. Commissioner of Education Studebaker points out these other developments: (1) the appointment of a specialist in his office in general adult and post high school education; (2) 50 research projects in the field dealing wholly or in part with adult education, but primarily in the vocational field; and (3) continuation of a project on adult education for illiterate Negroes carried on in cooperation with several other organizations and designed to prepare 150 teachers. He notes also that thirteen states, Puerto Rico and Hawaii now have full time directors of adult education and nine more have part-time directors. The American Council of Education is likewise interested in adult education through its committee network which covers the field of education generally.

NEGRO EDUCATION

By William Anthony Aery
Administrative Assistant, NACA Langley Memorial Aeronautical Laboratory

GENERAL

Negro education during 1947 centered very largely around the inequalities that have characterized dual school systems in 17 southern states and the District of Columbia, and especially in higher education, including graduate and professional education of qualified Negro men and women. Negro leaders emphasize the twofold idea that all men and women should have educational opportunities in proportion to their mental capacity and that among all groups, despite their ethnic origin, there are to be found potential scholars and/or professional teachers, doctors, dentists, lawyers, engineers, and business men. They carried on a vigorous publicity campaign to acquaint the American people with the evidence of the relative backward condition of Negro education from the kindergarten to the professional level, in spite of what appear to be increasingly large financial outlays. The *Survey Graphic* (Jan.) and the *Journal of Negro Education* (Summer) gave detailed information concerning the educational limitation which 14,000,000 American Negroes face on account of widespread and growing segregation. Liberal white leaders, North and South, joined with Negro leaders in promoting better race relations with a view to the improvement of all types of Negro education and the early supply of some 42,000 more Negro teachers, as well as the adequate financial public support of Negro higher education at the graduate and professional levels.

ECONOMICS AND NEGRO EDUCATION

Economics is one of the great foundation stones upon which Negro educational progress must rest, yet there has been little research in the relation of economics to the vast American Negro population, either by whites or Negroes.

Dr. Robert C. Weaver, director of the community services division, American Council on Race Relations (Chicago), presented a comprehensive "Program of Research in Race Relations" (*Journal of Negro Education,* Spring) which emphasized the value of economic research. Some problems worthy of study follow: changes in racial occupational patterns in Negro industrial employment; labor displacement due to mechanization of southern agriculture; place of Negro worker in industrial ghost towns; experiences of Negroes in industrial unions; influence of railroad brotherhoods on Negro employment; economic costs of segregation; Negro occupancy and property values; costs of race restrictive housing; cost of house ownership for Negroes; cost of medical care to Negroes; and administration of social legislation.

The social science departments at the University of Chicago and Fisk University (Nashville, Tenn.) have stimulated study in the field of sociology and economics as they relate to the Negro minority group, according to Dr. Weaver, but today there is need for more workers and more funds with which to carry forward the program that he has outlined.

The University of North Carolina *News Letter* (Mar. 26, 1947) presented the following information, compiled by the National Commission for the Defense of Democracy through Education:

Ten highest states in education were Utah, California, Nevada, Washington, Wyoming, Oregon, Idaho, Massachusetts, Colorado, and Maine. Ten lowest states were Kentucky, Tennessee, Arkansas, Virginia, Mississippi, North Carolina, Alabama, Georgia, Louisiana, and South Carolina.

	Averages Ten Highest States	Averages Ten Lowest States
1. Median number years of schooling completed	9.8	7.5
2. Yearly per-capita income	$620	$309
3. Yearly per-capita retail sales	$396	$182

From 1940 to 1945 in North Carolina, there was an increase in farms operated by Negroes, whereas prior to 1940 Negro farmers had been on the decrease—from 60,268 to 74,273. There was a similar trend among Negro tenants—from 41,994 to 54,414. This increase was largely in the profitable tobacco region of eastern North Carolina. From 1930 to 1940 practically every county in North Carolina had lost Negro tenants—a net loss of 26.5 per cent, while half of the counties gained and half lost white tenants. These figures presented by S. H. Hobbs, Jr. (University of North Carolina *News Letter*, May 7) indicate that Negro rural education has become an even more serious problem for North Carolina.

Basically, economics in the South, as well as elsewhere, is so closely related to agriculture that it is most important for Negroes everywhere to thrive on the farm, if Negro education is to be improved appreciably. Effort must be made wherever there are masses of Negroes to improve their economic status.

PUBLIC-SCHOOL EDUCATION—PROBLEM OF NUMBERS

The seriousness of the problem of public-school education for Negroes lies partly in the vast numbers of pupils that must be handled. The enrollment of Negro pupils in elementary grades for the school year 1943-44 (U. S. Office of Education, *Biennial Survey of Education in the United States,* 1942-44, Sept.) was 2,029,368—boys, 1,004,789; girls, 1,024,579. There were in 1943-44 for the same 17 southern states and the District of Columbia an enrollment of 247,374 pupils in high school—boys, 84,886; girls, 162,488.

Of the 2,276,742 Negro pupils in elementary and high-school grades, there was an average daily attendance of 1,852,950; total number of days attended by all Negro pupils, 303,802,159; average number of days attended by each pupil enrolled during the year, 133; average length of school term in days, 164; percentage of enrolled pupils in daily attendance, 81.4; and percentage of pupils in high school grades, 10.9.

The Negro public-school instructional staff numbered 66,553—elementary schools, 55,223 (in 1919-20, 37,625); high schools, 11,330 (in 1919-20, 935). Here is evidence of a growing interest in Negro high-school education, since in 1919-20 there were 2,070,374 pupils in elementary grades; and 33,341 pupils in high school grades.

Negro high-school graduates in 1943-44 numbered 31,180—boys, 8,338; girls, 22,842. The number of Negro pupils per classroom teacher has been as follows: 1919-20, 55; 1929-30, 45; 1939-40, 38; and 1943-44, 35. The pupil-teacher rate for the 31 states not having separate schools for Negroes is 27.5.

PROBLEM OF DISTRIBUTION

The enrollment in Negro elementary and secondary schools varied widely from state to state and often the states with the lowest economic income had the heaviest burden in supporting even inferior schools for whites and Negroes, as the following Office of Education figures indicated for 1943-44:

ENROLLMENT IN ELEMENTARY AND SECONDARY SCHOOLS

	White	Negro
Alabama	413,567	228,468
Arkansas	300,898	99,999
Georgia	426,126	256,023
Louisiana	269,347	163,248
Mississippi	275,097	272,495
North Carolina	568,919	256,634
South Carolina	244,042	204,942
Tennessee	503,686	102,734
Texas	1,043,438	199,547
Virginia	391,937	142,841

For 1943-44, some 2,276,742 Negro pupils were distributed as follows—elementary (including 8,515 in kindergarten), 2,029,368, with 539,762 in grade 1; 282,170 in grade 2; 271,737 in grade 3; 254,872 in grade 4; 225,511 in grade 5; 196,298 in grade 6; 163,629 in grade 7; and 86,874 in grade 8; secondary, 247,374, with 99,148 in year 1; 68,404 in year 2; 47,695 in year 3; 31,989 in year 4; and 138 in postgraduate year.

By slow degrees Negro schools have reduced the congestion of pupils in grades one to three and have held more pupils to graduation from both the elementary and the secondary schools.

For 1943-44 the Office of Education reported as follows on Negro education in 17 southern states and the District of Columbia: Total instructional staff, 66,553, including 298 supervisors, 1305 principals, and 64,950 teachers—men, 8147; women, 56,803—including 52,265 elementary and 12,685 secondary teachers; cost per Negro pupil in average daily attendance, $34.

PROBLEM OF COST

The per-pupil costs varied, for example, as follows: Alabama, $25.65; Arkansas, $25.81; Florida, $47.44; Georgia, $23.63; Louisiana, $40.25; Maryland, $90.82; Mississippi, $11.96; North Carolina, $50.07; Oklahoma, $95.21; and South Carolina, $26.89.

Some expenditures for Negro public day schools in 15 southern states and the District of Columbia for the year 1943-44 were reported as follows by the Office of Education: general control, $1,383,141; instruction, $38,276,122, including $37,043,898 for salaries of instruction staff and $486,217 for textbooks; operation of plant, $1,294,094; maintenance, $1,418,748; promotion of health, $120,175; and transportation of pupils, $1,349,834.

Whereas Arkansas spent $1,547,555 on Negro instruction and Mississippi spent $2,309,435, Georgia spent $4,131,875 and North Carolina spent $9,410,738. In all these instances, however, economic income and racial understanding were important factors in state outlay for Negro education.

PROBLEM OF EQUALIZATION

The *Journal of Negro Education* (Summer yearbook) presented in 166 pages interesting and valuable material on "The Availability of Education in the Negro Separate School," prepared by 25 men and women who represent real leadership in the field of Negro education. Editor Charles A. Thompson, dean of the Howard University Graduate School, supplied a critical introduction and came to the following conclusion:

"The elimination of disparities in financial outlay for Negro and white common schools has been so slow that, even if equality of expenditures assured equality of educational opportunity, it would take 25 years or more for the Negro schools to reach the point where the white schools are *now,* and a hundred years to attain parity. . . . To date, the validity of the 'separate but equal education' principle has not been demonstrated anywhere; and theoretically it is impossible as well as undemocratic. . . . It is clear that segregation in education based upon race must be abolished. The question is when and where to start. It is the considered opinion of a growing number of intelligent people, North and South, white and Negro, that we should begin *now* in the graduate and professional fields, gradually working down to the lower levels."

Among the major topics in the Yearbook are the following: "Origin and Development of the Negro Separate School"; "Present and Legal Status"; "Education of Negroes in States Where Separate Schools Are Not Legal"; "Development and Character of Permissive and Partly Segregated Schools"; "Negro Education in Sixteen Southern States and the District of Columbia"; "Availability of Education for Negroes (a) in the Elementary and (b) Secondary School"; "Higher Professional Schools for Negroes"; and "Special Educational Services to Negroes."

Some brief findings follow: The Negro school term in 1945 was about equal to the white school term in 1930. Negro school teachers in 1945 received an annual salary of $939 (in 1930, the average was $510). The difference in white and Negro teachers' salaries has been reduced from 85 per cent to 40 per cent in the last 15 years. This reduction has been made possible by court decisions that required the payment of equal salaries to white and Negro teachers with the same training when they were doing similar work. Very little progress has been made in the equalization of facilities for transporting Negro pupils to school or for providing public-school buildings and equipment. In 1945 the amount invested in Negro school property was $52 for each Negro pupil (white, $224). "It would take, at the present rate of progress, 60 years before the buildings and equipment in Negro common schools would become substantially equal to those provided for white pupils in 1945, to say nothing of the future." Proportionately, three and a half times as many white pupils as Negro pupils are furnished transportation to school and twice as much per pupil is spent for transporting a white pupil as for a Negro pupil. Texas spent as much money merely to transport white pupils to school in 1945 as it spent on the Negro common schools for everything—teachers' salaries, transportation, teaching materials, etc.

FAVORABLE TRENDS

From 1939-40 to 1943-44, the average length of school term for Negroes increased in 17 southern states and the District of Columbia from 156 days to 164 days (white, from 170.8 to 173.5). The average number of days attended by Negroes increased from 125.7 days to 133.4 (white, for both periods was 145). The average number of pupils per teacher in Negro schools showed a decrease from 37.7 to 34 pupils (white, from 29.2 to 28).

The expenditures and teachers' salaries in Negro schools in the past 10 years increased substantially. The average annual salary of principals, supervisors and teachers for the year 1943-1944 ranged as follows:

State or District of Columbia	Whites	Negroes
Alabama	$1,158	$ 661
Arkansas	924	555
Delaware	1,953	1,814
Florida	1,530	970
Georgia	1,123	515
Louisiana	1,683	828
Maryland	2,085	2,002
Mississippi	1,107	342
Missouri	1,397	1,590
North Carolina	1,380	1,249
Oklahoma	1,428	1,438
South Carolina	1,203	615
Tennessee	1,071	1,010
Texas	1,395	946
West Virginia	1,364	1,129
District of Columbia	2,610	2,610

Source: *Biennial Survey of Education*, 1942–44, U. S. Office of Education, 1947.

The differentials in school pay appeared to have no corresponding effects on average length of term in days in school (Negroes, 164.0; whites, 173.5); average number of days attended by each pupil enrolled in school (Negroes, 133.4; whites, 145); and number of pupils enrolled per member of instructional staff in schools (Negroes, 34; whites, 28), according to U. S. Office of Education figures, published in 1947.

PROBLEM OF DISCRIMINATION

"Differentials in the per-capita expenditures for Negroes and whites in southern states have been reduced," said Walter White, executive secretary of the National Association for the Advancement of Colored People (New York), to a Town Hall audience (Oct. 7); "but even today four times as much is spent for the education of white children as for Negro children. Scientists are unanimous in saying that there is no difference based on race or skin color in the educability of human beings; but Negroes are not four times as intelligent as whites, and thus able to compete in the grim race of life with one-quarter of the education given to their white fellow-Americans. It is not Negroes alone who pay the price for such discrimination. It is America itself."

Prof. Robert Redfield, professor of anthropology, University of Chicago, pointed out in "Race and Religion in Selective Administration," (*Journal of the American Association of Collegiate Registrars,* July) that the per-pupil annual expenditure for public schools showed great variation among states as well as between racial groups as shown below:

	Whites	Negroes
New York	$157	—
New Jersey	136	—
North Carolina	46	$28
Alabama	48	15
Mississippi	52	7
Arkansas	37	14
Missouri	80	—
Illinois	115	—
Minnesota	100	—
Nebraska	74	—
Texas	73	28
Colorado	92	—
Montana	109	—
Nevada	131	—
California	142	—

CIVIL RIGHTS

The President's Committee on Civil Rights reported as follows on Negro education: "With respect to education, as well as other services, the committee believes that the 'separate-but-equal' rule has *not* been obeyed in practice. There is a marked difference in quality between the educational opportunities offered white children and Negro children in the separate schools. Whatever test is used—expenditure per pupil, teachers' salaries, the number of pupils per teacher, transportation of pupils, adequacy of school buildings, and educational equipment, length of school term, extent of curriculum—Negro students are invariably at a disadvantage.

"Opportunities of Negroes in public institutions of higher education in the South, particularly at the professional- and graduate-school level, are severely limited" (*The New York Times,* Oct. 28).

"The provision of higher and professional opportunities for Negroes by several States is relatively little, if any, better than 15 years ago." Three times as many undergraduate curricula are offered in the average state college or university for white students as are offered in the corresponding Negro higher institution. Graduate work is offered in 8 Negro state colleges in seven states, which gave work leading to the Master's degree only. No Negro higher institution, public or private, offers work leading to the Doctor's degree. Graduate work leading to the Master's degree is offered by at least one state-supported institution for white students in each of the 17 southern states, and the Ph.D. degree is offered in 12 states (*Journal of Negro Education,* Summer).

PROFESSIONAL LEVEL

Professional education in state institutions was available for white students as follows: Dentistry, 4 states; law, 16; medicine, 15; pharmacy, 14; social work, 9; and library science, 11. For Negroes, no state-supported institution in any state provides opportunity for training in medicine, dentistry, or pharmacy;

and only four institutions offer training in law and only one in library science.

In 1944, an amount equal to $2.43 for each person in the white population of 17 southern states was expended for public white higher institutions as contrasted with 56 cents for each Negro. In 1930, the corresponding amounts were $1.39 for whites and 33 cents for Negroes. The difference in favor of white institutions has increased by 13 per cent.

SEGREGATED EDUCATION

Behind the thought and action of many leaders in Negro education, during 1947 in particular, was the silent working force of the disturbing idea of racial segregation, which the masses apparently accepted as inevitable if not acceptable and leaders strove to eliminate—apparently in vain.

Liberals who wished to see segregation modified so that Negroes would receive equal treatment in the allotment of jobs in industry, in jimcrow railroad service, and in dual school systems received little encouragement, since the final pinch came to Negroes who, except for some odd centers in the border states, remained practically voteless, even though they had indicated a willingness to give up a mythical alliance with Republicanism.

Dr. Will W. Alexander, vice-president of the Julius Rosenwald Fund (Chicago), Dr. Charles S. Johnson of Fisk University, and Mrs. Harper Sibley, president of the United Council of Church Women, joined in warning against the spread of segregation at the January meeting of Survey Associates. Segregation was characterized as "a substitute for slavery" and as damaging the personalities of those who perpetuate it. The general call to the nation was: "Help America relieve itself of the necessity for hypocrisy."

On June 27 the National Association for the Advancement of Colored People, representing a membership of 535,000 citizens in 184 chapters, announced a systematic drive against the dual educational system in the 17 southern and border states. Thurgood Marshall, chief of the NAACP legal staff, stated that the line of attack would start from the top, with professional and graduate schools being given first consideration.

Cases were already under way in Louisiana, Oklahoma, South Carolina, and Texas, with the schools of higher education being challenged first because they appeared to be most vulnerable.

"There can be no equality," said Marshall, "as long as there is segregation, regardless of the dollar-and-cents equality argument that many persons have raised in the past. The only way to attack racial discrimination is to attack racial segregation. In due time it [the attack] will get down to the grade schools and the kindergartens, wherever public money is being spent for education." Marshall added that local branches of the Association will handle future cases filed for equal salaries for Negro teachers in segregated schools and will use local lawyers. Cases have been filed to adjust salaries in Arkansas, Georgia, Louisiana, and Virginia.

Northern cities were warned by the NAACP to be on guard against the growth of separate schools, and the creation of racial ghettos must be viewed with real alarm. Ghettos bring about neighborhood schools that are racially separate (*The New York Times,* July 28).

COLLEGE EDUCATION ENROLLMENT

According to Martin D. Jenkins of Howard University (*School and Society,* May 10, and *Journal of Negro Education,* Summer), enrollments in Negro colleges and universities reached new high levels in 1947. Ninety-six institutions, for example, reported a total of 59,150 resident students in undergraduate, graduate, and professional curricula. There were 56,984 Negro undergraduates in 92 institutions; 822 graduates in 15 institutions; medicine, 514 in two institutions; dentistry, 314 in two institutions; and law, 149 in three institutions.

Dr. Jenkins estimated an overall enrollment of 63,000, of which veterans constituted 30 per cent. Fifty-four per cent of the undergraduate students and 85 per cent of the graduate students were to be found in private institutions. Seventy per cent of the undergraduates were attending full-accredited institutions. A typical Negro institution of higher learning is one with a student enrollment of 470.

For the full year 1945-46 the Negro enrollment in higher institutions was approximately 85.000 students. Howard University (Washington, D. C.) had an enrollment of 5,045, including 3,374 veterans during the fall term and 6,913 during the academic year 1945-46.

Among all 1945-46 graduates there were 5.448 with a baccalaureate degree; 311 with a Master's degree. Sixteen Negro institutions offered work leading to the Master's degree.

TEACHER SALARIES

A survey of Negro colleges revealed the fact that the median 9-month salary of a representative group of institutions was only $1,316. Probably this median in 1947 reached $1,500, a sum surely too small to attract promising young college teachers of any group. Professor Thompson pointed out that the median salary in Negro land-grant colleges was only 60 per cent as high as the median salary in the white land-grant colleges. The penalizing effect of this fact on a minority group is self-evident, despite all explanations.

Negro colleges in general lack salary schedules. "Promotion becomes a matter of bargaining, with the college offering to pay no more than is necessary to retain the teacher. If the teacher does not have another offer in hand, he generally gets little or nothing." Very few Negro colleges have a tenure system. Generally the president decides questions of tenure. "The teacher in the typical Negro college," according to Professor Thompson, "holds his position subject only to the will of the president, and without adequate provision for old age. . . . Teaching in a Negro college does not look as attractive as it did some years ago, when the occupational horizon of Negro youth was much narrower."

In the fall of 1946, some 18,216 Negro veterans enrolled in college—44.41 per cent over the fall of 1945. For all types of institutions, the percentage rise was 3.92. Negro colleges increased their veteran enrollment by 8,090 students and reached 26,306, according to a U. S. Office of Education press release (Nov. 26).

The largest percentage increase in college enrollment for the Fall of 1946 was in Negro institutions; namely, 26.05. The Negro college enrollment for 1946-47 was 74,173 as against 58,842 for the year before. The Negro freshman enrollment was 23,248 as against 21,769 the year before, an increase of 6.79 per cent.

FACULTY SHORTAGE

As Prof. Charles H. Thompson of Howard University (Washington, D. C.) pointed out in "Improvement of the Negro College Faculty" (*Journal of Negro Education*, Winter), since the First World War Negro colleges have developed from high school to full college status; many of them "have practically built new plants"; many of them have developed effective faculties; and many of them have been accredited by regional associations.

Today, however, Negro colleges need to recruit immediately 1,000 faculty members; need 15 to 20 per cent more teachers to meet the increasing student enrollment made up largely of returned soldiers, sailors, and airmen; and need to meet the higher salaries offered young men and women in industry, in public-school and government service, and in private business.

The Negro colleges are struggling to encourage bright young men and women to make college teaching a career. As more vocations are opened for Negroes, the more difficult it becomes for Negro colleges to attract, with their relatively small salaries and heavy teaching loads, the kind of prospective faculty members they need.

FINANCIAL CAMPAIGN

The United Negro College Fund, Inc. (New York) sought to raise during 1947 the sum of $1,300,000 for 33 member colleges. Frank M. Totton, vice president of the Chase National Bank, served as chairman, and John D. Rockefeller, as chairman of the national advisory committee. Those who were active in working for the Fund supported vigorously the idea that the Negro problem is not insolvable, if the American people support a constructive program in Negro education which aims, in part at least, to train competent leaders with a college background.

This Fund assisted colleges with a current enrollment of 14,340 men and 12,612 women, as well as a probable summer enrollment of over 11,000 teachers. The total endowment of all the Negro colleges sharing in the Fund was $41,000,000, which is less than half of the endowment of Yale alone.

FIRST NEGRO PRESIDENT OF FISK UNIVERSITY

Fisk University at Nashville, Tenn., set aside Nov. 6-8 as the inauguration period for its first Negro president, Dr. Charles Spurgeon Johnson, and held a series of conferences and seminars on social science, education, and international relations. The speakers in 15 fields included Mrs. Franklin D. Roosevelt; President Frank Graham of the University of North Carolina; J. Melville Broughton, former Governor of North Carolina; Prof. Howard W. Odum, of the University of North Carolina; President F. D. Patterson of Tuskegee Institute; Chancellor Harvie Branscomb of Vanderbilt University; President Mordecai W. Johnson of Howard University; Frank W. Jenkins, president of the International Harvester Company; Ralph Bunch, director of United Nations Division of Trusteeships; Mark Ethridge, publisher of the *Courier-Journal* (Louisville); Marshall Field, 2d, publisher; Governor William Hastie of the Virgin Islands; and Dr. Calvin Hoover, research director of the National Planning Association's Committee for the south.

Dr. Johnson is the sixth and first Negro president of Fisk University which was established in 1866 by the American Missionary Association and the Western Freedmen's Association. More than 2,000 visiting educators, alumni, and friends attended the induction ceremonies.

The new president of Fisk is a native of Bristol (Va.) and received his undergraduate training at Virginia Union University (Richmond). Following his service with the infantry in the First World War, he achieved a distinguished career as author, social investigator, organizer, and teacher. He is widely known for his work as editor of *Opportunity,* a publication of the National Urban League; as director of the Governor's Commission on Race Relations in Chicago, which set to work after the riots of 1921; and as American delegate to the first session of the United Nations Educational, Scientific, and Cultural Organization.

GRADUATE EDUCATION

Every southern state, except Mississippi, according to *The New York Times* (Jan. 19), has provided graduate education for Negroes under the costly system of differential scholarships that grew largely out of a Supreme Court decision—Gaines case—of 1938.

During 1947, some 2,500 Negroes were receiving some financial aid under these scholarships, awarded when a Negro student can not study for a graduate degree, because it is not offered in the state college or he is denied admission to the state university because of his or her color.

In most cases these scholarships

make up the difference it would cost a Negro to study in his state's white school and his expenses at another college where segregation is not required. The differential scholarships were not generally adopted until after Lloyd Gaines applied for admission to the University of Missouri Law School and was denied on account of his race.

In 1938, the U. S. Supreme Court ruled that when a state provides educational opportunities on a certain level to one racial group there is legal obligation to furnish substantially the same opportunities to all racial groups. The State of Missouri later set up a Negro law school in St. Louis, a graduate school in journalism at Lincoln University for Negroes, and in addition appropriated $25,000 a year for differential scholarships.

The Supreme Court admitted the right of states to segregate by races, but required them to offer equal educational facilities. The southern states have instituted programs to finance out-of-state training for its Negro citizens seeking graduate and professional training.

PROGRESS IN GRADUATE COURSES

North Carolina has developed many graduate courses for Negro citizens. The state has a full School of Law at the North Carolina College for Negroes and there offers graduate work in certain educational fields. Graduate training in science is offered at the Agricultural and Technical College for Negroes at Greensboro and is being expanded to meet growing demands. North Carolina still maintains an unlimited appropriation to cover graduate studies that are not otherwise offered to Negro citizens of the state. In 1945, for example, North Carolina paid out $22,000 to send Negro students for out-state training. In 1946, 170 Negro students applied for differential scholarships.

In lieu of the differential scholarships, Virginia makes it possible for its Negro citizens to take an outright grant equal to the state cost per student in the institution to which admission was denied. It should be noted that in 1945 Virginia spent $75,000 on differential scholarships which went to 377 Negroes and 35 medical and dental scholarships.

Hampton Institute (Va.) included in its 1947 Summer-school program a series of programs devoted to the arts of the theatre, including the dance, the cinema, the folk symphony, the classical drama, and the modern play, for the enjoyment and cultural enrichment of Negro teachers and white citizens of the local community. This institution also offered credit courses for graduate students in art, 2; education, 16; English, 5; home economics, 6; industrial education, 4; and social science, 6; as well as eight courses in special education for teachers who deal with those having hearing and speech defects and those who are blind.

The Hampton workshop program enabled Negro teachers to concentrate their study on specific problems that related to their schools and communities. This 5-hour a day study included laboratory and classroom work, lectures, demonstrations, conferences, audio-visual aids, trips, and systematic reading. The following workshops were held: personal health problems of supervisors; nutritional deficiencies and corrective feeding; guidance through education; public-school reading problems; high-school dramatics; and audio-visual aids.

PROFESSIONAL EDUCATION

The Southern Governor's Conference served notice on Congress that the South would seek its approval of legislation authorizing state compacts for establishing cooperative ownership and operation of regional schools for providing professional training of Negroes, a subject of current court litigation in several southern states.

According to *The New York Times* (Oct. 22): "The governors discussed the question whether establishment of a regional [professional] school for Negroes as a possible solution of the racial educational problem in the South might not meet the constitutional requirements handed down in recent decisions of the United States Supreme Court. . . ."

NEGRO PHYSICIANS

Dr. Montague Cobb, professor of anatomy, Howard University Medical School, conducted a survey for the national health committee of the National Association for the Advancement of Colored People (New York) and uncovered some striking—even startling—facts, some of which follow.

Howard and Meharry, the two existing Negro medical schools, are not meeting the community needs of the Negro population. The combined resources of these two professional schools are not keeping pace with the growth of the Negro population. Howard Medical School has over 1,300 applications for 70 places in the next class; Meharry faces practically the same problem. The professional aptitude test ratings of applicants for the Negro medical schools have regularly averaged below the national mean.

A few Negro students were attending the northern universities, but some 3,000 Negroes attended southern colleges, "creating a bad situation with the economically poor regions supplying the majority of the trained Negro personnel."

Ranking dental schools have had similar experiences in securing good prospective students.

There are 87 qualified Negro specialists in the United States, largely concentrated in Washington, Chicago, New York, St. Louis, Philadelphia, and other cities. The policies of the American Medical Association make membership contingent upon membership in a local, county, or state association, which usually deny membership to Negro doctors. The ratio of Negro physicians to population range from a national ratio of 1-to-780 to 1-to-1,002 in Missouri, and 1-to-18,527 in Mississippi.

Over 9,000 Negro physicians are needed to meet the minimum standard on the basis of a segregated community. Not all Negro physicians, however, are opposed to segregated schools and hospitals.

TEST CASE IN OKLAHOMA

In November, the U. S. Supreme Court agreed to decide whether Oklahoma must admit a qualified Negro applicant to its State University Law School. Oklahoma courts had held that it would be illegal to admit Negroes to white schools or for white students to be admitted to Negro schools.

The test case was brought by Ada L. Sipuel, graduate of Langston University (Okla.). The case began in the Winter of 1945-46, when the State University conceded that Miss Sipuel's application papers were in order, but denied her admission because she was a Negro. Miss Sipuel brought suit in Cleveland County District Court to compel the University to admit her. This plea was denied and the State Supreme Court affirmed the ruling of the lower court.

The Oklahoma courts held that Miss Sipuel's admission was contrary to the constitution, laws, and public policy of the State. Oklahoma has provided out-of-state scholarship aid for Negroes. No Negro law school has been maintained by Oklahoma.

Miss Sipuel contended (1) that equal protection of the laws, guaranteed by the U. S. Constitution, was being denied her; and (2) that it was the unquestioned duty of the State of Oklahoma to provide equal educational facilities for Negroes and white persons.

SOUTH CAROLINA DECISION

Federal Judge J. W. Waring held early in July that South Carolina need not admit a Negro to its state law school. If the state chooses not to do so, however, it will have to provide adequate facilities for Negro students at a Negro college or "furnish no law-school education to any persons of either the white or Negro races." The law does not forbid segregation, but it forbids discrimination.

NEW COLLEGE IN TEXAS

In September, the State of Texas opened a new college for Negroes on a 53-acre tract of land on the outskirts of Houston. Two thousand students had applied for segregated education. This development came about in a peculiar fashion. In February 1946, Herman M. Sweatt, a Negro former mailman and war veteran who was qualified for the study of law, applied for admission to the State of Texas University Law School, but was rejected on the ground that he was a Negro.

The National Association for the Advancement of Colored People, relying on the U. S. Supreme Court in the 1938 decision on the Gaines case in Missouri, brought a mandamus suit to require the State of Texas "to fulfill its legal obligations to provide adequate educational facilities for all residents, regardless of race or color." Texas' only state-supported Negro college at Prairie View offered no law course. The Attorney-General argued that segregation was part of the state constitution and could not be changed. Finally, the Legislature appropriated money for a Negro university at Houston and an interim Negro law school at Austin, which, according to *Life* (Sept. 29), was "an inadequate 3-room basement suite with a few part-time professors. Sweatt did not show up to register. Neither did anyone else." Neither Sweatt nor the NAACP was satisfied with the interim Negro law school and the suit against the University of Texas continued.

It should be noted that the new Negro college near Houston has no law school. Allen E. Norton, the acting president who is a Negro, recently stated that it would probably take 25 years to build this institution into a university that could adequately serve Negroes in the matter of professional education.

HEALTH EDUCATION GRANTS

Negro education throughout the nation was given marked impetus during 1947 through important money grants from the National Foundation for Infantile Paralysis (New York). Tuskegee Institute (Ala.) received $60,000 for the training of students in polio nursing. Prior appropriations for the Tuskegee Institute Infantile Paralysis Center included $78,536 for after-care of Negro orthopedic cases; $72,498 for the development of laboratory facilities; $14,876 for the nurse-training program; and $5,140 for use in areas where hospital facilities were inadequate.

The Provident Medical Association of Chicago received a grant of $50,000 for fellowships in orthopedic surgery, pediatrics, and neurology, for Negro physicians. This grant became effective July 1.

Meharry Medical College (Nashville, Tenn.) received $41,840 for instruction in pediatrics, $16,200 in orthopedic surgery, and $9,630 to provide service training and to improve the teaching program in physical medicine. These grants became effective July 1.

The Georgia Warm Springs Foundation received aid with which there could be provided eight beds for emergency cases for Negro patients in that area. These patients would be transferred elsewhere when facilities should become available.

A special grant of $8,800 was made to the North Carolina College for Negroes to train Negro teachers, supervisors, and coordinators of health education.

The Duke University School of Medicine (Durham, N. C.) was given a grant of $2,400 to provide a clinical supervisor at Lincoln Hospital (Durham).

Knickerbocker Hospital, located in the Negro area of New York City, received $30,866 for the first of a series of training and treatment centers in the care of polio cases.

Individual scholarships were awarded to Negro applicants through the U. S. Public Health Service and the National Research Council (Washington, D. C.).

At the recent annual observance of National Negro Health Week, inaugurated 33 years ago by Booker

Washington, the fact was announced officially that today the life expectancy of American Negroes, North and South, as "57 years" (*Time*, April 7). Nevertheless, Negro health still lags a full generation behind that of American whites with a white life expectancy of 66 years, according to the U. S. Public Health Service. The Negro infant death rate is 63 per cent higher than that for the white infant. Major killers among Negroes are tuberculosis, kidney disease, and pneumonia. The cancer rate among Negroes has been rising, too. Negroes have only 124 hospitals—"many of them substandard," according to *Time*—with a total of 20,800 beds out of a national total of 1,700,000—even when Negroes constitute about 10 per cent of the entire population.

PUBLICATIONS

Some of the outstanding publications of 1947 that shed light on the American Negro and his problems, particularly his educational problems, follow: *Minority Problems in the Public Schools*, by Theodore Brameld (Harper); *One America: . . . Problems of Our Racial and National Minorities*, by Francis J. Brown and Joseph S. Roncek (Prentice-Hall); *Jim Crow America*, by Earl Conrad (Duell, Sloan, Pearce); *Slavery to Freedom*, by John H. Franklin (Knopf); *Into the Main Stream* by Charles S. Johnson (University of North Carolina); *When People Meet: Study in Race and Culture Contacts* (Hinds, Hayden, Eldredge); *High Cost of Prejudice*, by Bucklin Moore (Messner); *Negro Handbook*, by Florence Murray (A. A. Wyn); *Negro Business and Business Education*, by Joseph A. Pierce (Harper); *Slave and Citizen*, by Frank Tannenbaum (Knopf); *God Is for White Folks*, by Will Thomas (Creative Age); and *Education for Negroes in Mississippi Since 1910*, by Charles H. Wilson (Meador).

LIBRARIES

By Mildred Othmer Peterson
Special Assistant, American Library Association

OPERATING COST PROBLEM

Facing most libraries are the major problems of operating costs, which have increased 50 per cent since 1940 while incomes have lagged far behind, and acute personnel shortages.

The impetus which the war and peace gave to the use of libraries has not lifted their incomes to the same degree, according to the 1946-47 report of Carl H. Milam, executive secretary of the American Library Association. Statistics for all types of libraries are not available, but the total expenditures for libraries in the United States have increased from $50,485,609 in 1935 to $64,917,302 in 1945, or an increase of about 12½ per cent as against an estimated increase in costs of about 50 per cent. "Such a reduction in the buying power of libraries would be serious at any time. It is tragic in this period when the U. S. and the world need a great improvement and expansion of the agencies of communication, information, and education. Never in the history of the world has it been so urgently necessary that people's opinions be based on truth, not on prejudice and propaganda."

NATIONAL PLAN FOR PUBLIC LIBRARY SERVICE

Under the leadership of Carleton B. Joeckel, the National Plan for Public Library Service (see "Libraries" 1946) was completed, but its realization depends upon the citizenry at large. The published plan proposes that public library service be provided through the maintenance of about 1,200 large library systems which would serve the entire population rather than the 7,500 established libraries, which leave one-third of the population unserved and another third very inadequately provided for. Also proposed by the plan are 20 multi-state reference centers, 48 effective state library agencies, and a national bibliographic and library center. These local, state, regional, and national agencies are to be interlocking to form a federated system. The standard set is $1.50 per capita for minimum service with no unit receiving less than $37,500 annually. In 1941, the extreme range of income was from $1.02 per capita in Massachusetts to 4 cents in Mississippi. In five states, the expenditures were less than 10 cents per capita and, in 33 states, less than 50 cents per capita was available. The National Plan states: "The American Public Library is an expression of American Democracy in action. If library planning is to succeed at any level of government, active citizen support is essential." It is estimated that $200,000,000 annually will be needed for services, $500,000,000 for new buildings and enlargements and repairs on present buildings, and $175,000,000 for stocking new and substandard libraries. Present annual public library expenditures are approximately 60 per cent of the amount which local communities should provide for library service. Also proposed in the plan are new and improved types of service, use of audio-visual materials and other new media of communication, and ways of improving personnel, buildings, and library methods.

OTHER NATIONAL GROUP PLANNING

Almost all other library groups have also adopted or are completing national plans. These include College and University Libraries and Librarianship, the Farmington Plan for research libraries, School Libraries for Today and Tomorrow, The Public Library Plans for the Teen Age, and Objectives and Standards for hospital libraries. Plans are also being completed for children's library service, for international relations, for library use of audio-visual materials, for the recruitment and professional education of more and better library personnel, and for new library buildings.

AMERICAN PUBLIC LIBRARY INQUIRY

Financed by a Carnegie Corporation grant of $175,000 to the Social Science Research Council, a two-year study known as the American Public Library Inquiry is being made under the direction of Robert D. Leigh. This study of the American free public library, which was proposed by A.L.A., will include a comprehensive survey of the adequacy of the public library as a source of citizen information, and an analysis of its actual and potential contribution to American society. In each of the 49 representative American communities, ranging from metropolitan to rural areas, which have been selected for study, the character of the library facilities and their relation to the needs of the population will be analyzed (see *A.L.A. Bulletin,* November 1947). This study is considered the most important piece of library research ever undertaken in the United States.

CONFERENCE PLANNING AND GRANTS

Organized by A.L.A. and financed by a Carnegie Corporation grant, a Conference on International, Cultural, Educational and Scientific Exchanges was held in Princeton, N. J. in November 1946. Conference recommendations and plans covered such subjects as bibliographies, inter-library loans, rehabilitation of libraries, and exchange of publications and personnel.

During 1947, after more than a year of planning, advertising and selling, the Library Public Relations Service, sponsored by A.L.A., was launched by a firm of public relations counselors with about 100 libraries subscribing. Cooperatively financed, the plan offers public relations programs and materials for the better interpretation of the library and its potentialities to the public.

Needed services which the A.L.A. hopes to undertake when funds are available include: an expanded program in adult education; implementation of the national plans; promotion of specialized library service for labor; a vigorous recruiting campaign; and improvement in the present A.L.A. Headquarters service.

AUDIO-VISUAL SERVICES

In the field of library audio-visual services the grant to A.L.A. of $27,000 from the Carnegie Corporation for a two-year program makes possible observation, exploration, and promotion, as well as planning in this relatively new type of library service. Direct assistance, by a specialist in this field, is also offered to libraries in inaugurating such services.

LOCAL OR REGIONAL SURVEYS

Several local or regional surveys with recommendations for future activities were made during the year. These include the A.L.A. surveys of the Carnegie Library of Oklahoma City by Joseph L. Wheeler and Walter Herbert Kaiser and of the Stanford University Libraries by Louis Round Wilson and Raynard C. Swank. A survey of the library resources of nine southeastern states—Alabama, Florida, Georgia, Kentucky, Mississippi, North and South Carolina, Tennessee, and Virginia—is being made under the auspices of the Tennessee Valley Library Council by Marion Milczewski. In Ohio, New York, and Connecticut, statewide surveys have been made of library facilities and services.

RELATIONS WITH FEDERAL AGENCIES

The work of the A.L.A. National Relations Office in Washington (see "Libraries," 1946) has centered around the following three categories since its establishment in October 1945: legislative activities, relations with Federal agencies, and relations with other organizations. Library relations with Congress were concerned with the Library Demonstration Bill (S.48; H.R. 2465), revision of the postal rates, establishment of a National Science Foundation, Federal aid to education, proposed restriction on use of funds for national archives, extension of social security, cultural relations with other countries, and appropriations for the Library of Congress, Library Service Division of the U. S. Office of Education, Army libraries, and UNESCO. It is estimated that the efforts of the national relations program have prevented an increase in cost to libraries of between $200,000 and $250,000 annually in postal rates.

INTERNATIONAL ACTIVITIES

There is a strong feeling of responsibility among librarians throughout the world that a quiet but determined effort on their part is necessary in promoting understanding during an uneasy period of time, according to the annual report of Flora B. Ludington, chairman of the A.L.A. Board of International Relations, which has a Washington, D. C. office maintained by a Rockefeller Foundation grant. This feeling of responsibility, together with renewed opportunities for travel and for cultivating professional relationships, has given U. S. librarians many contacts with foreign librarians both in this country and abroad during the year.

International library activities included: final work on the books and periodicals projects for devastated libraries in war areas, Latin America, China, Philippines, and the Near East; the completion of the A.L.A.'s contract with the U. S. State Department covering the operation of the American libraries at Mexico City, Managua, and Montevideo; visits of foreign librarians; representation at meetings of the Committee of the International Federation of Documentation; participation in the Assembly of Librarians of the Americas at the Library of Congress; attendance of a large number of distinguished librarians from many parts of the world at the A.L.A. Conference at San Francisco; visits of several U. S. librarians, as consultants, to Japan, Korea, and Germany at the request of the U. S. Government; and cooperation with the Junior Red Cross in the inauguration of a project for the translation of children's books into foreign languages.

Since the inception of UNESCO, librarians have participated in its work, including representation at the general conferences, membership on the U. S. Commission, and the assembling of materials for a public library exhibit at the second General Conference in Mexico in November 1947. Librarians of the U. S. are especially interested in the library program of UNESCO, and an active part has been taken in advising and planning. In response to request for advice, the International Relations Board has proposed that UNESCO library rehabilitation funds be used for planning, stimulating, and coordinating; that the elimination of currency exchange barriers be emphasized; that an agency of each country report to UNESCO the most urgently needed library materials and that there should be no questionnaire survey of losses at this time; that UNESCO should facilitate reestablishment of direct exchange relationships; and that UNESCO should frequently make public the extent of its program. (For the complete annual report of the International Relations Board, as well as other reports, see the Oct. 15, 1947 issue of *A.L.A. Bulletin.*)

GRANTS OF THE INTERNATIONAL RELATIONS OFFICE

Since its establishment in 1942, the International Relations Office has expended grants totaling over $1,800,000 directly or indirectly to promote library interests throughout the world. Approximately $900,000 was received from the Department of State, $800,000 from the Rockefeller Foundation. and the balance from other sources. A total of $365,000 was spent for 100,000 volumes, which were sent to 986 libraries in 21 Latin American countries; $450,000 for American libraries in Latin America, principally those at Mexico City, Managua, and Montevideo; $550,000 for books and periodicals as aid to libraries in war areas; and $100,000 for books for China, $85,000 for books for the Near East, and $24,000 for books for The Philippines.

After five years of wartime operation on a large scale the A.L.A. International Relations Board surveyed its work and made the following recommendations for the future: a reduction in the operation of long-time projects such as purchases of books for other countries; more emphasis on advisory, planning and coordinating services in the broad field of international understanding. The policy statement and survey report by Ralph R. Shaw were published in the (June 1947) *A.L.A. Bulletin.*

OTHER INTERNATIONAL ACTIVITIES

On June 24 to 26, 1947, the first annual conference of the Canadian Library Association was held at the University of British Columbia, Vancouver.

Seventeen U. S. information libraries in foreign countries were closed (50 remain open) and 13 librarians recalled from overseas duty by the State Department because of reduced appropriations.

The American Library in Paris, an effective cultural link between France and America since its founding in 1920 by the A.L.A., circulated over 8,500 books and 1,500 periodicals monthly, according to its 1945-46 report. Its patrons are 80 per cent French and 20 per cent other nationalities.

March, 1947 was the first anniversary of the founding of the first library in London devoted entirely to the needs of boys and girls from 6 to 16 years of age.

A new school of library science was founded in Campinas, Brazil. This is one of the training centers made possible by librarians trained at the Library School of São Paulo, Brazil.

A chain of repository libraries throughout the world, to receive all official United Nations publications and to act as local research centers on matters of world organization, was developed by the United Nations Library Service, Lake Success, N. Y. A total of 215 large, recognized national and university libraries, including 28 in the U. S., comprise the network.

Articles in the (June, 1947) *Wilson Library Bulletin* give present day information on various European libraries. In Denmark, for example, it is said that the Germans did not attempt to destroy the libraries, although they did try to control them. Sven Dahl was appointed "Rigsbibliotekar" or director of the Royal Library and the University of Copenhagen library. This position also involves certain duties in connection with all research libraries maintained by the state. During the war he gathered a unique collection of Danish "underground material"—200 papers and several hundred books and pamphlets.

In France, in spite of heavy losses, the public libraries "still remain the richest in the world in the value and rarity of their volumes." At Oxford, England, the new Bodleian Library was completed with space for 4,000,000 volumes. This is part of the library extension project costing $1,000,000, three-fifths of which was provided by the Rockefeller Foundation.

About 3,000,000 volumes with rare manuscripts and stage costumes, valued at $10,000,000 were rescued in the spring of 1947 from fire smoldering for many months in a potash mine at Heinboldshausen, Germany. Of the entire collection, hidden by the Nazis, about 50,000 volumes were destroyed by fire.

Dr. Karl Renner, president of Austria, was formerly General-Staatsbibliothekar of the Library of Parliament of Austria, with which he had been associated for 30 years.

STATE AND LOCAL DEVELOPMENTS

While encouraging developments have been accomplished in the extension of library service, it was estimated in 1947 that 35,600,000 persons, mainly in rural areas, or 27 per cent of the people in the U. S., are still without library service. The number of regional and county libraries has increased from 401 in 1939 to 808 in 1946. In library legislation, progress was made in Colorado, Iowa, Indiana, Ohio, and Washington, while new county or regional libraries were established in Missouri, Tennessee, and Vermont. Increases in state aid budgets were reported by Maryland, North and South Carolina, and Ohio, and increased library tax ceilings were granted in Indiana, Minnesota, Mississippi, and Montana. Colorado, Maine, Michigan, New Hampshire, and Oregon passed bills enabling them to accept Federal aid for libraries, in anticipation of the passage by Congress of the Library Demonstration Bill. The A.L.A. Library Extension Board has set a goal of library service to 10,000,000 more people by 1951.

In Illinois, demonstrations of district library service were being conducted in six library regions of the state, made possible by a $300,000 state appropriation, and in the Dallas area in Pennsylvania a rural library project was started at the instigation of the local Rotary Club.

State aid for school library materials for 1946-47 include: Georgia, $130,870; New Jersey, $10,000; North Carolina, $163,914; Virginia, $793,952; and Tennessee, $50,000.

ADULT EDUCATION

Public libraries have recently placed increased emphasis on adult education and a new pattern appears to be emerging. It assumes an integration of adult education activities with all units and aspects of adult library work, especially in the neighborhood agency and the medium-sized library, in place of an earlier pattern which conceived of adult education as a restricted special service attached usually to larger libraries. There has been an expansion of activities to and through existing groups leading to closer coordination of library services and community programs and a larger participation by libraries in the planning of community activities.

The Chicago Public Library reports that it has a collection of 925,000 pages of hand-copied braille, the work of the Johanna Lodge Transcribing Group of Volunteer Workers, who have been doing this for the past 25 years. These volumes are loaned to readers in all parts of the world.

Adult education programs have placed new emphasis on the need for audio-visual materials in the library collection. Approximately 25 public libraries, and several school and university libraries, own and circulate films for group, classroom, or home use. Some libraries lend as many as 1,000 films each month. Many other libraries serve as centers of information about films and as agencies for the procurement of films for groups within the community. During the war, a ceiling projector was developed that would permit bed-ridden patients, unable to hold a book, to read from a microfilm image on the ceiling over their heads. At first these projectors were sold only to veterans and military hospitals. A limited number are now available for civilians and are being used experimentally by a few public libraries. The projectors and the microfilm copies of the books are sold on a non-profit basis.

Phonograph records are becoming widely used by libraries. Starting in a few libraries 20 years ago, records are now collected and used by at least 500 public school and college libraries, some of which loan them for home use.

COLLEGE AND UNIVERSITY LIBRARIES

Increased activity by college and university libraries since 1939 culminated in the appointment in 1947 of the first executive secretary for the Association of College and Reference Libraries, with offices at the American Library Association headquarters.

According to a 1947 survey of the book stock of college libraries, it is estimated that, whereas the total number of volumes in 1,321 college libraries reporting was 71,666,801 volumes, by 1960 it will reach 143,300,000, with an estimated value of $501,600,000. The national college book stock approximately doubles every 20 years. It is estimated that the costs of library buildings now planned total $25,000,000 to $35,000,000, and that a similar amount of additional construction and equipment can be anticipated by 1960.

College and university library statistics for 1945-46, covering enrollment, faculty, book stock, circulation, salaries and income were published in the (July, 1947) *College and Research Libraries.*

At a conference for librarians of 110 member institutions of the American Association of Theological Schools in the United States, Canada, and Puerto Rico, the American Theological Library Association was founded June 23-24, 1947 at Louisville, Ky.

The *Harvard Library Bulletin,* a new 1947 publication in this field, "represents the 82 Harvard libraries, and its content will deal primarily with these libraries, with the results of research based upon their holdings, and with more general library problems in the light of Harvard theory and experience."

Many colleges and university libraries have shown considerable interest in microphotography, and grants such as that given to Oregon State College for 1948 have resulted in considerable research in this field.

There is a definite trend among college and university librarians to cultivate a mutual understanding with their colleagues in learned societies and other professional associations.

LIBRARY TRAINING AND PERSONNEL

The shortage of trained personnel is one of the most serious problems of libraries today. Indicative of the situation is the fact that the A.L.A. Placement Office received 2,232 requests in 1946-47 to fill positions, as compared with 1,653 in 1945-46, while only 401 persons registered for positions and most of them were already employed. While salaries were generally somewhat higher in 1947, a tentative survey by the A.L.A. Board on Personnel Administration revealed that hundreds of professional librarians are not yet paid the recommended minimum of $2,100. A panel discussion on "Salaries—What can we do to improve them?" at the A.L.A. San Francisco Conference (*A.L.A. Bulletin,* August 1947) emphasized this problem.

Increased enrollments, reaching prewar totals, were reported by the 34 accredited library schools in the U. S. The number of students enrolled in 1946-47 was 1,843, as compared with 1,499 in 1945-56. In the two Canadian library schools, 96 were enrolled as compared with 61 in 1946. Except for housing shortages the enrollments would be larger.

The wholesome discontent with education for librarianship continues, and the period of 1939-47 was marked by a reappraisal of library schools by themselves as well as by the entire profession. While changes for the most part were keyed to current demands, library schools kept in mind the necessity of maintaining high standards with a view toward permanent improvement in library education. A basic goal is to determine the general education and professional training needed for various levels and types of library work.

It was estimated in 1944 that 18,000 librarians would be required in the six years following the close of the war. The number of additional professional librarians required from 1947-60 is now estimated at 64,160. Of this number, 4,900 represents the present shortage, 22,760 normal replacements, 36,500 new personnel for planned expansion and 2,000 now in the armed forces or military librarians who may return. The estimated enrollment of 3,000,000 students in colleges and universities by 1960 will require the expansion of library activities in these institutions.

The A.L.A. Board on Personnel Administration has set up a project for the holding of ten personnel institutes and two personnel clinics throughout the country to assist all types of small and medium sized libraries (staff of less than 50) in developing and administering well-rounded personnel programs.

During 1940-46, 208 Europeans applied to the A.L.A. Refugee Librarians Committee for advice and assistance. Of this number, 197 were assisted in securing library positions or library training leading to a position. Their problems are discussed in an article in the (June 15, 1947) *Library Journal.*

GRANTS AND BEQUESTS

Throughout the year, gifts of book collections and money for the purchase of books or construction of buildings have greatly aided libraries. Among the gifts were: a famous collection of 800 early American children's books (1682-1836) to the Free Library of Philadelphia by A. S. W. Rosenbach; $1,509,389 (producing an income of about $38,000 annually) to Columbia University for expanding its collections in American history by Frederic Bancroft; a 500-volume Celtic library of the late Arthur C. L. Brown to the University of Chicago Library by his wife; a library and a children's playground to the San Antonio Public Library by Mansfield Landa in honor of his wife; and a bequest of $55,000 to the Riverside (Calif.) Public Library from Charles Francis March.

Gifts to Yale University library included an extensive collection of materials on the history of the American petroleum industry by T. W. Phillips, Jr., the most complete files of the *New York Weekly Journal* (1733-36) in existence by Frank Altschul, and a 22,000 volume medical library by the late Dr. Arnold C. Klebs of Nyon, Switzerland. A $5,000 bequest was made to the St. Louis Public Library by the widow of Frederick M. Crunden, librarian of the library, 1877-1909, and the Lyle Saxon memorial collection of 500 books, pictures and manuscripts was presented to Tulane University, New Orleans, from the Saxon estate. A five-year grant of $915,000 was made by the Carnegie Foundation for the Advancement of Teaching in 1946 for the improvement of college teaching. The 45 southern institutions included in the program will provide an additional $260,000, and a portion of the total amount will be used to purchase books and in other ways to improve library facilities of the participants.

Another five-year Carnegie Corporation grant of $250,000 to four southern universities—North Carolina, Texas, Tulane, and Vanderbilt—will provide for Latin American study centers.

The Chicago Chemical Library Foundation, organized by the Chicago Section, American Chemical Society, and the Chicago Chemists' Club, is raising a minimum of $100,000 to be expended over ten years for the purchase of scientific literature for the John Crerar Library, Chicago. War memorial bookshelves for public libraries are being sponsored by American Legion Auxiliary units, and many colleges and universities, including the University of California at Los Angeles and the Carnegie Institute of Technology, have received memorial books in honor of their student dead.

FUNDS FOR BUILDINGS

By the will of Herbert F. Hall, a science and technology library, the Linda Hall Library, Kansas City, was made possible by a trust fund of $6,000,000. Its first quarters were opened during the year in the Hall Mansion. The Boston Public Library received a fund which will amount to $3,000,000 from John Deferrari to be used in part for a new wing or building. A $20,000 fund was raised by the Junior Chamber of Commerce for a public library for a residential area near Charleston, S. C., and $10,000 was presented to the Louisiana State Library by John M. Caffery as a nucleus for a public library building in the Parish of St. Mary.

Made possible by several large gifts, the Kresge-Hooker Scientific Library, considered an outstanding one of its kind in the world, was opened at Wayne University, Detroit. The $850,000 Don L. Love Memorial Library, University of Nebraska, Lincoln, was formally opened. It was completed in 1943 but used as barracks for the Army Specialized Training Program. Work was begun on the new $6,000,000 Harvey S. Firestone Memorial Library, Princeton University and the new $790,000 wing of the library of the University of California at Los Angeles.

Bond issues of $2,500,000 at Denver and $1,500,000 at Tacoma will provide for new library buildings.

Many buildings or additions for public, college and university, and special libraries, which were deferred because of the war and shortages of materials, are being constructed.

AMERICAN LIBRARY ASSOCIATION OFFICERS

Officers for the year 1947-48: President, Paul North Rice, New York Public Library; First Vice-President and President-elect, E. W. McDiarmid, University of Minnesota; Second Vice-President, Elizabeth D. Briggs, Cleveland Public Library; and treasurer, Harold F. Brigham, State Library, Indianapolis.

A.L.A. MEMBERSHIP AND OFFICES

An international organization composed of 16,000 librarians, library trustees, and friends of libraries, the Association was organized in 1876 to promote the foundation and improvement of libraries in the United States and Canada. Headquarters are at 50 East Huron Street, Chicago 11, with Carl H. Milam, Executive Secretary. An International Relations Office is maintained in the Library of Congress Annex, Washington 25, D. C. with Frederick Cromwell, director. The Association's National Relations Office is located at 1709 M Street, N. W., Washington 6, D. C., Paul Howard director.

CONFERENCES

Midwinter conferences were held in Chicago during December 1946 and January 1948, while the 66th Annual Conference in San Francisco in June 1947 was attended by 2,600 delegates from the United States, Alaska, Hawaii, and 24 foreign countries. The next conference is scheduled for June 13-19, 1948 at Atlantic City.

ANNUAL AWARDS

Miss Mary E. Frayser, Rockhill, S. C., and Thomas H. McKaig, Hamburg, N. Y., were awarded the annual citations for distinguished service as library trustees.

Carolyn Sherwin Bailey received the 26th annual Newberry Medal for *Miss Hickory,* the outstanding children's book of the preceding year. Leonard Weisgard was awarded the 11th annual Caldecott Medal for the illustrations in the most distinguished picture book, *The Little Island,* by Golden MacDonald.

The first *Letter* Award for an outstanding example of progressive library service was presented to the Enoch Pratt Free Library, Baltimore, for its program of adult education in atomic energy. The *Letter* Award to a librarian "for the humanizing of knowledge" was conferred on Natalie Mayo, head of the children's department, San Francisco Public Library.

Presented every two years to the compiler of the best bibliography in the field of agriculture or related sciences, the 11th Oberly Memorial Award (1945-46) went to Burch Hart Schneider for *Feeds of the World: Their Digestibility and Composition.*

The John Cotton Dana Publicity Awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. Public Relations Committee, were given to the following libraries for effective public relations programs: George Amos Memorial Library, Gillette, Wyo.; Santa Barbara Public Library; South Chicago Branch, Chicago Public Library; Des Moines Public Library; Minneapolis Public Library; Harley School Library, Rochester, N. Y.; Michigan State Library; and St. Louis Public Library.

A.L.A. FINANCES

The Association's endowment is approximately $2,100,000. The total income in 1946-7 was about $682,000. Approximately $103,000 came from membership dues, $140,600 from sales of books and periodical subscriptions, and $73,500 was income on endowment funds. Payment of group retirement annuity premiums amounted to $164,600, and $173,300 is derived from outside sources in the form of grants or payments for specific purposes.

PUBLICATIONS

During the year, in addition to the regular periodicals, *A.L.A. Bulletin, Booklist, Subscription Books Bulletin, College and Research Libraries,* and *Hospital Book Guide,* the A.L.A. Publishing Department issued 29 new or reprinted publications from a total of over 200 projects being considered. Among the 1947 publications were: *Books Published in the United States, 1945,* A.L.A. International Relations Board; *By Way of Introduction,* Grim, ed.; *Civil Service and Libraries,* A.L.A. Subcommittee on Civil Service Relations; *Classification,* Herdman; *History of Libraries in Great Britain and North America,* Predeek; *International, Cultural, Educational and Scientific Exchanges,* Williams and Noble, ed.; *Library Buildings for Library Service,* Fussler, ed.; *The Library in the School* (4th ed.), Fargo; *List of Theological Subject Headings,* Pettee; *Reference Books of 1944-1946,* Winchell; *Subject Guide to U. S. Government Publications,* Hirschberg and Melinat.

Among late 1946 or 1947 books in the library field issued by other publishers are: (1946) *Literary Prizes and Their Winners,* A. J. Richter (Bowker); *Personnel Administration in Libraries,* L. A. Martin, ed. (University of Chicago Press); *Public Administration of Public Library Service in the Knoxville-Knox County Area,* Gerald W. Shaw (University of Tennessee Bureau of Public Administration); *Scientific, Medical and Technical Books Published in the United States of America 1930-1944,* R. R. Hawkins, ed. (Bowker); *Study of Reading and Book-Buying Habits,* H. C. Link and H. A. Hopf (Book Manufacturers' Institute, New York); *Subject Headings,* Julia E. Pettee (Wilson); (1947)—*Catholic Library Practice* (University of Portland Press, Portland); *History and Bibliography of American Newspapers 1690-1820,* Clarence S. Brigham (American Antiquarian Society, Worcester, Mass.); and *Writing for Children,* Erick Berry and Herbert Best (Viking Press).
